Energy Research Abstracts

Abstracts 15266-17685

Office of Scientific & Technical Information
UNITED STATES DEPARTMENT OF ENERGY

CURRENT INFORMATION ON ENERGY

To provide immediate and complete coverage of literature related to major Department programs, the Office of Scientific and Technical Information provides an on-line retrieval system, data bases, and current-awareness publications. The Energy Data Base (EDB), which contains all unclassified, unlimited energy and nuclear related information processed by OSTI since 1974, and the Nuclear Science Abstracts Data Base (NSA), which covers nuclear information from 1948 through June 1976, are available for machine searching using commercial on-line retrieval systems. All information in the publications listed below, plus additional backup information, is included in the EDB. Current information being added to the EDB is available for on-line searching via the OSTI Automated Retrieval System (OARS) accessible to DOE and contractors through the Integrated Technical Information System (ITIS).

The publications described below and access to ITIS/OARS are available to Department of Energy and contractor components from the Office of Scientific and Technical Information, U. S. Department of Energy, P. O. Box 62, Oak Ridge, TN 37831/Telephone (615) 576-1301; FTS 626-1301.

PUBLICATIONS OF THE OFFICE OF SCIENTIFIC AND TECHNICAL INFORMATION

Energy Abstracts for Policy Analysis (EAPA)

A monthly abstract journal devoted to the analysis of energy research, conservation, and policy. Scope and coverage are limited to substantive articles or reports and emphasize legislative, regulatory, and other legal aspects, as well as social, economic, and environmental impacts. *EAPA* is available from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The annual subscription price is $72.00 for domestic (North America) or $90.00 for foreign (outside North America) subscribers; a single issue is $5.00 or $6.25, respectively.

Energy Research Abstracts (ERA)

A comprehensive semimonthly abstract journal devoted to all areas of energy-related information produced by the Department of Energy, other U. S. government organizations, and foreign governments. *ERA* is available from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The annual subscription price for the 24 issues is $146.00 for domestic (North America) subscribers or $182.50 for foreign (outside North America) subscribers. A single issue is $14.00 or $17.50, respectively.

DOE Patents Available for Licensing (PAL)

DOE is prepared to grant exclusive or nonexclusive, revocable licenses under DOE-owned U. S. patents and patent applications; this semiannual publication provides abstracting and indexing coverage of this literature. *PAL* is available as PB87-946800 from the National Technical Information Service (NTIS), 5285 Port Royal Road, Springfield, VA 22161 on a standing order basis through an NTIS Deposit Account. To establish an NTIS account, send the minimum $25.00 deposit to NTIS, Attn: Customer Accounts. A single issue is $12.00 for domestic (North America) and $24.00 for foreign (outside North America).

Energy Meetings (EM)

A monthly listing of conferences, symposia, workshops, etc., pertaining to DOE's programmatic interests. *EM* is available on subscription (use PB87-901500) from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. The annual subscription price is $70.00 for domestic subscribers and $140.00 for subscribers outside the North American continent; a single issue is $8.00 and $16.00, respectively.

The following semimonthly bulletins are also available from the National Technical Information Service. The annual subscription rate for one volume (calendar) year (24 issues; no indexes) is $80.00 for domestic (North America) and $160.00 for foreign (outside North America) subscribers; use the identifying order number (PB- No.) when subscribing.

Acid Precipitation (APC)–**PB87-901000.** Acid precipitation, including effects and possible control measures.

Buildings Energy Technology (BET)–**PB87-900700.** Technology required for energy conservation in buildings of all types.

Coal-Based Synfuels (CBS)–**PB87-901400.** Conversion of coal into gaseous or liquid fuels.

Coal Combustion and Utilization (CCU)–**PB87-914400.** Coal combustion, including fluidized bed combustion, and direct utilization of coal for power generation, fuel cells, and MHD generators.

Coal Preparation and Pollution Control (CPC)–**PB87-900800.** Coal preparation and cleaning and reducing pollution from its direct combustion.

Direct Energy Conversion (DEC)–**PB87-946600.** Photovoltaics, magnetohydrodynamics, electrohydrodynamics, thermoelectrics, thermionics, and fuel cells.

Energy from Biomass (EFB)–**PB87-900600.** Biomass production, conversion, and utilization for energy.

Geothermal Energy Technology (GET)–**PB87-914700.** Exploration, development, and utilization of geothermal resources.

Heavy-Ion Reactions (HIR)–**PB87-900500.** Heavy-ion ($A > 4$) reactions.

Laser Research (LAR)–**PB87-901100.** Laser research and development, excluding applications.

Nuclear Fuel Cycle (NFC)–**PB87-913400.** Both front and back ends of the nuclear fuel cycle.

Nuclear Reactor Safety (NRS)–**PB87-913500.** Accident analysis, safety systems, radiation protection, decommissioning and dismantling, and security measures.

Radioactive Waste Management (RWM)–**PB87-902900.** Management aspects of transport and storage, waste processing, waste disposal, waste storage, radioactive effluents, and shipping containers.

Solar Thermal Energy Technology (STT)–**PB87-901200.** Research and development of efficient and reliable solar thermal conversion systems.

Transportation Energy Research (TER)–**PB87-900900.** Energy-efficient advanced automotive propulsion systems and transportation energy conservation.

Unconventional Petroleum (UCP)–**PB87-901300.** Secondary and tertiary recovery of petroleum and oil shales and tar sands.

INTERNATIONAL ENERGY PUBLICATIONS

The Office of Scientific and Technical Information (OSTI) cooperates in the publication of international abstract journals with the following: (1) International Atomic Energy Agency, International Nuclear Information System, Vienna, Austria, for *Atomindex;* (2) International Energy Agency, Biomass Conversion Technical Information Service, Dublin, Ireland, for *Biomass Abstracts;* and (3) International Energy Agency, IEA Coal Research, London, England, for *Coal Abstracts.* In each case, the cognizant foreign agency provides the non-U. S. information to OSTI for inclusion in the Energy Data Base; in turn, OSTI provides the U. S. information for input into the respective journal.

Atomindex

A semimonthly abstract journal providing worldwide coverage of information on nuclear science and technology. *Atomindex* is available by subscription from Bernan Associates—UNIPUB, 10033-F King Highway, Lanham, MD 20706. The cost of an annual subscription, 24 semimonthly issues and semiannual and annual cumulative indexes, is $355.

Biomass Abstracts

A bimonthly abstract journal with comprehensive coverage of information on the conversion of biomass to energy. *Biomass Abstracts* is available free to DOE components and contractors from OSTI. Non-DOE organizations may obtain *Biomass Abstracts* from Biomass Conversion Technical Information Service, Institute for Industrial Research and Standards, Ballymun Road, Dublin 9, Ireland, for 60 IR pounds per year for participating countries and 90 IR pounds per year for nonparticipating countries. Make checks payable to the Institute.

Coal Abstracts

A monthly abstract journal providing comprehensive worldwide coverage of information in the field of coal science and technology. *Coal Abstracts* is available to DOE components and contractors from OSTI. Non-DOE organizations may obtain *Coal Abstracts* from IEA Coal Research, Technical Information Service, 14-15 Lower Grosvenor Place, London SW1W CEX, England, for 110 pounds sterling per year.

ENERGY RESEARCH ABSTRACTS

ABOUT THE OFFICE OF SCIENTIFIC AND TECHNICAL INFORMATION

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, has been the national center for scientific and technical information for the Department of Energy (DOE) and its predecessor agencies since 1946. In developing and managing DOE's technical information program, OSTI places under bibliographic control not only DOE-originated information but also worldwide literature on scientific and technical advances in the energy field and announces the source and availability of this information. Although the literature of science is emphasized, coverage extends to DOE programmatic, socioeconomic, environmental, legislative/regulatory, energy analysis, and policy-related areas. To accomplish the mission of furnishing centralized support for Departmental elements in managing their scientific and technical information, OSTI builds and maintains computerized data bases and disseminates information via computerized retrieval systems and announcement publications such as abstract journals, bibliographies, and bulletins. Direct access to OSTI's Energy Data Base (EDB) and Nuclear Science Abstracts Data Base (NSA) is available to the U. S. scientific community through commercial on-line retrieval systems. Access to these data bases from outside the United States is available only through formal exchange agreements. The current-year EDB records, DOE Research-In-Progress, and various other specialized DOE data bases are available to DOE offices and contractors and other government agencies through the OSTI Automated Retrieval System (OARS), which is a major component of the Integrated Technical Information System (ITIS). In addition to providing access to the OSTI on-line systems, ITIS serves as a gateway to other government and commercial systems and provides information merging for customized information products. The Office of Scientific and Technical Information has developed systems to record and communicate energy-related research-in-progress information, to track research report deliverables from DOE contractors, to test and make available DOE-funded computer software programs with scientific and management applications, and to produce special publications in support of DOE program offices. To manage DOE's technical information resources effectively, OSTI's program is one of continual development and evaluation of new information products, systems, and technologies.

ABOUT *ENERGY RESEARCH ABSTRACTS*

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports, journal articles, conference papers and proceedings, books, patents, theses, and monographs originated by the U. S. Department of Energy, its laboratories, energy centers and contractors. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations. The user should remain aware that *ERA* coverage of non-report literature is limited to that generated by Department of Energy activity.

ERA is comprehensive in its subject scope, encompassing the DOE's research, development, demonstration, and technological programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

ERA is available on an exchange basis to universities, research institutions, industrial firms, and publishers of scientific information. Inquiries should be directed to the Office of Scientific and Technical Information, P. O. Box 62, Oak Ridge, TN 37831.

ERA is available to the public on a subscription basis from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The subscription rate for the 24 semimonthly issues is $146.00 for domestic subscribers and $182.50 for foreign subscribers. A single issue costs $14.00 (domestic) or $17.50 (foreign). The cumulative indexes will be available in printed form from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, and in microfiche form from the National Technical Information Service, U. S. Department of Commerce, Springfield, VA 22161.

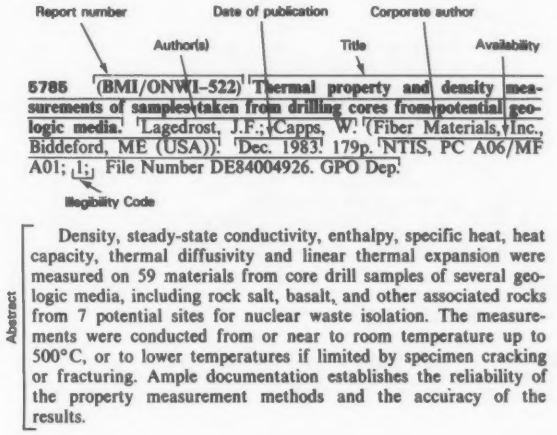
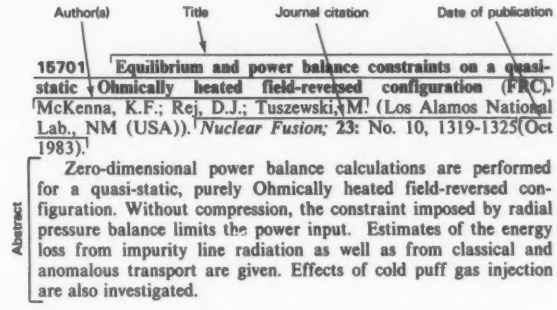
HOW TO USE *ENERGY RESEARCH ABSTRACTS*

ABSTRACTS IN *ENERGY RESEARCH ABSTRACTS*

The principal elements of abstract entries for a typical research and development report and a typical technical journal article are illustrated below.



Report number
Date of publication
Corporate author
Author(s)
Title
Availability
5785 (BMI/ONWI-522) Thermal property and density measurements of samples taken from drilling cores from potential geologic media. Lagedrost, J.F.; Capps, W. (Fiber Materials, Inc., Biddeford, ME (USA)). Dec. 1983. 179p. NTIS, PC A06/MF A01; 1; File Number DE84004926. GPO Dep.
Legibility Code
Abstract
Density, steady-state conductivity, enthalpy, specific heat, heat capacity, thermal diffusivity and linear thermal expansion were measured on 59 materials from core drill samples of several geologic media, including rock salt, basalt, and other associated rocks from 7 potential sites for nuclear waste isolation. The measurements were conducted from or near to room temperature up to 500°C, or to lower temperatures if limited by specimen cracking or fracturing. Ample documentation establishes the reliability of the property measurement methods and the accuracy of the results.



Author(s)
Title
Journal citation
Date of publication
15701 Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC). McKenna, K.F.; Rej, D.J.; Tuszewski, M. (Los Alamos National Lab., NM (USA)). Nuclear Fusion; 23: No. 10, 1319-1325 (Oct 1983).
Abstract
Zero-dimensional power balance calculations are performed for a quasi-static, purely Ohmically heated field-reversed configuration. Without compression, the constraint imposed by radial pressure balance limits the power input. Estimates of the energy loss from impurity line radiation as well as from classical and anomalous transport are given. Effects of cold puff gas injection are also investigated.

INDEXES TO *ENERGY RESEARCH ABSTRACTS*

Five indexes are provided for approaching the contents of each issue of *Energy Research Abstracts (ERA)*. Each index is preceded by an introduction that details the organization of the index and the principles by which it was compiled. The reader is referred to these introductions for information not found in the index examples that follow.

• Corporate Author Index

Technical report literature is indexed using the name of the organization or institution responsible for the issuance of the report.

5785 (BMI/ONWI-522) **Thermal property and density measurements of samples taken from drilling cores from potential geologic media.** Lagedrost, J.F.; Capps, W. **(Fiber Materials, Inc., Biddeford, ME (USA)).** Dec. 1983. 179p. NTIS File Number DE84004926. GPO Dep.

is indexed as:

Fiber Materials, Inc., Biddeford, ME (USA)

• Personal Author Index

Each author's name is indexed in the form appearing on the document abstracted, with the exception that given names are reduced to initials:

Capps, W., *See* Lagedrost, J. F.
Lagedrost, J.F., Thermal property and density measurements of samples taken from drilling cores from potential geologic media, 9:5785 (R;US)
McKenna, K.F., Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC), 9:15701 (J;US)
Rej, D.J., *See* McKenna, K.F.
Tuszewski, M., *See* McKenna, K.F.

• Subject Index

The subject index consisting of entries naming specific materials, objects, and processes is arranged alphabetically. Document titles, informative phrases, or both specific to these entries are arranged alphabetically under the entries.

SALT DEPOSITS
Density
Thermal property and density measurements of samples taken from drilling cores from potential geologic media, 9:5785 (R;US)
REVERSED-FIELD PINCH
Energy Balance
Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC), 9:15701 (J;AT)

• Contract Number Index

DOE technical report literature is indexed using contract numbers. This index contains the contract number with corresponding abstract and report numbers.

AC06-76RL01830	**Fiber Materials, Inc., Biddeford, ME (USA)**	
	9:5785	BMI/ONWI-522

• Report Number Index

Technical report literature is also indexed using report numbers. This index includes information on where individual reports may be obtained. Patents and conference papers are indexed here as a matter of convenience. When a report is supplied under a File Number, that number is included in the availability statement. A file number–report number correlation is included for convenience.

BMI/ONWI-522	9:5785	NTIS, PC A09/MF A01. File Number DE84004926, Distribution Category MN-70

SUBJECT CONTENTS (NUMERICAL LISTING)

Six-digit subject category numbers are used in the storage, retrieval, and manipulation of bibliographic information entered into DOE's computerized bibliographic information system. The six-digit category numbers are utilized as if they were three pairs of two-digit numbers, the first two pairs being used to arrange the abstract content of *Energy Research Abstracts*. The following listing includes the totality of the 41 first-level and 276 second-level subject categories used. Because each issue of *ERA* announces only those documents becoming available during a semimonthly period, some subject categories may not be represented in every issue. The complete subject category scheme with scope definitions and limitations is available as DOE/TIC-4584-R6 from NTIS for $9.50.

ENERGY RESEARCH ABSTRACTS

01 COAL AND COAL PRODUCTS

15266 **(DOE/FE—0079) Cooperative R and D ventures: An opportunity for leveraged research in fossil energy.** (USDOE Assistant Secretary for Fossil Energy, Washington, DC). Feb 1987. 18p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87005573.

In connection with its continuing exploration of a cooperative R & D venture program, the Department of Energy, Fossil Energy, has assembled herein some materials for use in connection with a series of regional meetings for public discussion of the concepts. The materials include a news release of January 14, 1987; a Federal Register Notice of January 26, 1987, announcing the regional meetings; and an excerpt from a previously published document (DOE/FE-0075) of October 1986 which describes the program. After determining that a proposed cooperative R & D venture addresses appropriate national needs, the focus of the government's review will be on the probable magnitude of the benefit streams to be derived from successful completion of the venture relative to its cost of participation. DOE/FE's assessment of the nature and value of probable returns will take into account the following interconnected elements: the quality and value of the venture research target; the soundness of the planned technical approach; the expertise of the technical team; the managerial strength, business acumen, and degree of corporate commitment of the primary venture partners; the business arrangements whereby achievements are to be translated into future returns for distribution to the original participants; and the probable state-of-the-art and the marketplace following completion of the R & D venture, relative to the subsequent steps and investments required to translate successful research results into successful commercial use. DOE/FE reiterates its commitment to flexibility, streamlining, and sound business and operating arrangements within the context of these proposed cooperative R & D ventures.

15267 **Proceedings: 1985 international conference on coal science.** Sydney, Australia; Pergamon Press (1985). 995p. (CONF-851003—). Pergamon Press, 19a Boundary St., Rushcutters Bay, N.S.W., 2011 Australia. File Number TI87004322. Contract FG01-84FE60425.

From Conference on coal science; Sydney, Australia (28 Oct 1985).

This volume covers the proceedings of the third of the current series of International Conferences on Coal Science, which was held 28-31 October 1985 in Sydney, N.S.W., Australia. Now that oil and gas prices have not only stabilized but have even shown some decline, complacency on future energy supplies from these sources could once more cast a shadow over coal and blunt the need for coal research. Such a course would be fraught with danger. The long-term situation remains substantially unchanged and, although the precise time remains uncertain, all the evidence points to a future when coal will have to serve as a substitute for declining resources in oil and gas; even now coal has a major role to play both as a fuel for combustion and for use in the metallurgical and other industries. Consequently the need for fundamental research into coal remains as strong as ever. To avoid a repetition of the events of the 70s and to ensure flexibility in energy supplies through to the next century, it is vital that this research effort be maintained. Papers have been entered individually into ERA and EDB.

15268 **(NP—7770062) Water removal characteristics of fine coal particles.** Fischer, D. (Technische Univ. Berlin (Germany, F.R.). Fachbereich Verfahrenstechnik). 11 Feb 1985. 107p. (In German). NTIS (US Sales Only), PC A06/MF A01. File Number DE87770062.

The water removal characteristics of black coal become the more difficult the smaller the average diameter of particles is. The dependence of the final water content on the share of particles <25 μm in the total material was substantiated: the greater the portion of m/sub <25/, the higher the final content of water. An overproportionate rise is noted in particular if m/sub <25/ is higher than about 16 percent. Very fine particles of coal <500 μm have a positive surface charge, while spoils have a negative one at a neutral pH value of the liquid phase. If the particle diameter d/sub max/ of a sample of coal particles is reduced from 500 μm to 25 μm, the surface charge of the very fine particles becomes negative. Surface charges were recorded indirectly during the investigations by determining electrophoretic mobility. Surface charge distributions can be modified to yield desired values by addition of reagents such as buffer solutions, respectively additives. Negative surface charge distributions, involving difficult water removal characteristics, can be shifted to distributions typical of low final water contents.

15269 **(BNL—38267) Enhancement of coal quality by microbial demetalization and desulfurization.** Krishna, C.R.; Francis, A.J.; Dodge, C.J.; Sproull, R.D. (Brookhaven National Lab., Upton, NY (USA)). Jun 1986. Contract AC02-76CH00016. 4p. (CONF-8606258—1). NTIS MF A01; 2; GPO Dep. File Number DE87005246.

From Biological treatment of coal workshop; Washington, DC, USA (23 Jun 1986).

Microbial demetalization and desulfurization of Illinois No. 6, Pittsburgh No. 8, and Ohio Quarto No. 8 coals were studied. In addition to significant removal of sulfur (80%) and iron (45%); calcium, magnesium, sodium, and small amounts of aluminum and other trace metals were solubilized from all coal types tested. The process variables such as slurry concentration, particle size, degree of agitation, temperature, and CO_2 and nutrient concentrations affected demetalization and desulfurization to varying degrees. Microbial demetalization and desulfurization of coals not only reduced the ash quantity but increased the ash fusion temperature of various coal samples by altering the ash composition. An increase in ash fusion temperature is generally beneficial because of reduced slagging and fouling in coal-fired boilers. A preliminary economic analysis indicates that microbial cleaning of coal prior to combustion may be a more suitable process for the upgrading of low rank coals than other convectional methods.

15270 **(CONF-850522—3) Development of a hot gas cleanup system for integrated coal gasification/molten carbonate fuel cell power plants.** Anderson, G.L.; Berry, F.O.; Harmon, B.D.; Laurens, R.M.; Biljetina, R. (Institute of Gas Technology, Chicago, IL (USA)). 1985. Contract AC21-82MC19403. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003951.

From 5. annual contractors' review meeting on contaminant control in hot coal derived gas streams; Morgantown, WV, USA (7 May 1985).

During the past year, IGT has been conducting bench-scale studies on a conceptual high temperature fuel gas desulfurization process known as the mixed metal oxide process. The objective of this process is not only to remove the sulfur-containing compounds from hot (>1000°F) fuel gases to ppM levels, but also to directly recover this sulfur in its elemental form. The subject of these studies has been the use of a 90% by weight cobalt titanate/10% by weight zinc oxide mixture. Although the mixture performed reasonably well under eleven (11) cycles of testing, the results suggest that additional improvements in the sorbents are needed. To remove more than 99% of the fuel gas sulfur at 1300°F requires space velocities of less than 300 h^{-1} and space velocities of <100 h^{-1} are probably required to achieve good elemental sulfur production during regeneration of the mixture. Both of these findings indicate the need for improved sorbent reactivity. IGT has also recently completed preliminary process economic studies on both the mixed metal oxide process for high temperature fuel gas desulfurization and the use of a composite molten alkali carbonate/ceramic sorbent developed by IGT for high temperature HCl removal. The process economic studies on the mixed metal oxide process examined six (6) different configurations. These studies indicate a probable cost of between 6 and 20 mills/kWh depending upon the configuration. The least costly configuration was one in which oxygen rather than air was used to regenerate the sulfided sorbent mixture. However, IGT has not yet conducted any tests on this configuration to determine whether it is technically feasible. The process economic studies on the composite molten alkali carbonate/ceramic sorbent for high temperature HCl removal indicate a probable cost of about 5 mills/kWh when applied to a feed gas containing about 300 ppM HCl. 3 refs., 7 figs., 6 tabs.

15271 **(CONF-860948—5) Fundamental studies on mineral matter behavior in ash-agglomerating coal gasifiers.** Carty, R.H.; Mason, D.M.; Babu, S.P. (Institute of Gas Technology, Chicago, IL (USA)). Sep 1986. Contract AC21-84MC21313. 20p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003955.

From 3. annual Pittsburgh coal conference; Pittsburgh, PA, USA (8 Sep 1986).

The Institute of Gas Technology is conducting a research program on ash chemistry to predict the behavior of the mineral matter in a fluidized-bed gasifier and its downstream units based on a minimum analysis of the characteristics of the mineral matter present in the coal feed and on the operating conditions. The bench-scale fundamental research investigation on the behavior of mineral matter, contained in chars from Pittsburgh Seam Coal from the Consolidation Coal Company's Ireland Mine in Marshall County, West Virginia, and from the No. 11 seam of Kentucky coal, were conducted in a 2-inch ID gasifier with a perforated plate gas distributor at atmospheric pressure, at 1255 and 1366 K, with char carbon conversions ranging from 24% to 94%. Some of the tests were conducted with low oxygen, 0.31 to 0.32 mole percent in the feed gas and others with 5.0 to 5.7 mole percent oxygen to investigate the effect of temperature due to the reaction of oxygen with the char. Feed chars ad char residues obtained from the 2-inch-ID batch gasification tests were analyzed chemically and by Moessbauer spectroscopy and were examined by optical petrography. The data analysis indicate that, during gasification the pyrite decomposes to ferrous sulfide and, at times, a minor amount of metallic iron. The ferrous sulfide in the interior of the char particles remains stable until exposed by burn-off of the char. As gasification proceeds, some of the iron compounds react with clays and silica to form low-melting ferrous alumino-silicates. In the tests without the center jet, roughly 30% of the iron became silicate, mostly in poorly defined forms. In pilot plant runs, the ferrous aluminosilicate serves as the agglutinating agent, embedding other ash particles and forming nearly spherical and dense agglomerates that selectively drop out of the fluidized gasification zone. 3 refs, 6 figs., 4 tabs.

15272 **(CONF-860961—6) Protective coatings and claddings: Application/evaluation.** Baxter, D.J. (Argonne National Lab., IL (USA)). Aug 1986. Contract W-31-109-ENG-38. 20p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004659.

From Instrumentation, components and materials contractors' meeting; Morgantown, WV, USA (16 Sep 1986).

The objective of the project is to develop corrosion-resistant coatings for the protection of low-alloy steels exposed in downstream waste heat recovery systems of coal gasifiers. A specification will be formulated for boiler-grade steels and established coating procedures that will serve as a guide for future designers of heat recovery systems. Corrosion test results show that chemical composition is an important factor influencing the corrosion resistance of both Al- and Cr-containing coatings. Coatings containing 20 to 29% Al generally exhibited protective oxidation behavior under isothermal conditions in the mixed-gas environments, but at 14% Al, even with 0.4 to 2% Cr, breakaway corrosion occurred. Under thermal-cycling conditions, approximately 30% Al was inadequate in preventing sulfide scale formation, although the additional presence of 5% Cr reduced the amount of sulfide formed in the scale and also reduced the severity of internal corrosive degradation of the coating. The corrosion resistance of chromized steels is critically dependent upon the coating composition and physical defects. With about 17% Cr on the 2-1/4Cr-1Mo steel, breakaway corrosion was observed in the high-p/sub S/$_2$ gas mixture. However, with Cr contents in the range of 22 to 25%, protective oxidation behavior was sustained, even under thermal-cycling conditions, although thermal cycling caused an increase in internal corrosion. The intergranular nature of internal corrosion highlights the weakness of the sensitized grain boundaries. Chromium-rich intergranular carbides, formed upon cooling from the chromizing temperature of ~1100°C, resulted in the depletion of Cr from regions immediately adjacent to the carbide-containing grain boundaries. As a result, these regions had lower resistance to corrosion. Breakdown of protection of chromized carbon steel appeared to be caused by defects present in the coating. 7 refs., 1 fig., 2 tabs.

15273 **(CONF-860961—7) Advanced research in instrumentation and control technology: Capacitance flowmeter.** Bobis, J.P.; Raptis, A.C. (Argonne National Lab., IL (USA)). Aug 1986. Contract W-31109-ENG-38. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004654.

From Instrumentation, components and materials contractors' meeting; Morgantown, WV, USA (16 Sep 1986).

The purpose of this task is to develop and apply instruments to measure the solid feedrate in coal gasification plant gas-solid feedlines, interstage lines, and recycling lines. To date, one of the most promising techniques for mass flow measurements in a solid/gas flow stream is the use of the nonintrusive capacitance sensor. The performance of the capacitance flowmeter (CF) with an improved electrode geometry has been measured experimentally in a gas-entrained 1000 μm glass bead flow stream at the Argonne National Laboratory (ANL) Solid/Gas Flow Test Facility (SGFTF). The CF measured the solid volume fraction (SVF) and particle velocity and the results were compared with time-of-flight measurements of short-lived radioactive particles. 21 refs., 9 figs.

15274 **(CONF-8608150—1) Recent developments in wet carbonization of peat.** Rue, D.M.; Mensinger, M.C.; Srivastava, V.J. (Institute of Gas Technology, Chicago, IL (USA)). Aug 1986. Contract AC22-83PC60775. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003952.

From Advances in peatlands engineering; Ottawa, Canada (25 Aug 1986).

Wet carbonization is a generic term for a thermal beneficiation process in which wet peat is heated to temperatures of 150 to 325°C at elevated pressures so that water present remains in liquid form. Wet carbonization produces a solid product with a higher heating value than raw peat. Wet-carbonized peat can be mechanically dewatered to a significantly lower moisture content than raw peat. A continuous-flow Process Research Unit (PRU), capable of processing 375 kg/h of peat slurry at temperatures and pressures up to 290°C and 7.60 MPa, respectively, was used to study the effect of wet-carbonization operating conditions on the peat. Thirteen tests were made with peats from Minnesota and Maine. For the Minnesota peat tests, the feed slurry solids concentration ranged from 6.1 to 13.7%. The average reactor operating temperatures and residence times ranged from 175 to 260°C and 1 to 60 minutes, respectively. The heating value enhancement of the wet-carbonized peats was as high as 21%, and the moisture content of mechanical-

ly-dewatered wet-carbonized peat was as low as 39% (compared with >65% for raw peat). A bench-scale, continuous two-phase anaerobic digestion system to recover energy and to treat wet-carbonization effluent water was designed, fabricated, and tested with effluent water from the PRU tests. At a short hydraulic retention time of 2.9 days, the system provided COD and BOD_5 removal efficiencies of 56 and 75%, respectively. The methane yield was approximately 86% of the average ultimate biodegradable yield. 6 refs., 10 figs., 2 tabs.

15275 (CONF-8611125—1) The U-GAS process for producing gas from coal. Patel, J.G.; Tarman, P.B.; Schora, F.C. (Institute of Gas Technology, Chicago, IL (USA); GDC, Inc., Chicago, IL (USA)). Nov 1986. 29p. Institute of Gas Technology, 3424 South State St., Chicago, IL 60616. File Number TI87900455.

From 4. advanced coal gasification symposium; Su Zhou, China (2 Nov 1986).

The Institute of Gas Technology (IGT) has developed the U-GAS process to produce a low- or medium-Btu gas (U-GAS) from different types of coal feed stocks. The process uses a combination of fluidized-bed gasification and ash agglomeration in a single-stage reactor. A 30 tons per day capacity pilot plant has been used to develop the process. Feedstocks ranging from unreactive coke to peat have been gasified successfully in the same pilot plant, indicating its ability to handle a wide variation in feedstock properties. An extensive data base for design and scale-up to a larger size gasifier has been developed in the pilot plant. Recent tests have investigated the possibilities of innovative sulfur and particulate cleanup from the raw product gas. These developments improve the economics of the process, especially for application of the gas as a fuel and for combined-cycle power generation. Activities related to commercialization of the U-GAS technology are proceeding in several countries. This is the second paper on the U-GAS process to be presented at the Advanced Coal Gasification Symposium Series of the People's Republic of China. In this paper, the results of recent pilot-plant tests are presented, and the supporting technical programs being conducted at IGT to broaden the technology base are described. 13 figs.

15276 (DOE/MC/20050—2226) Study of high temperature removal of alkali of a pressurized gasification system: Final report. Bachovchin, D.M.; Alvin, M.A.; DeZubay, E.A.; Mulik, P.R. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Chemical Sciences Div.). Oct 1986. Contract AC21-83MC20050. 225p. NTIS, PC A10/MF A01; 1; GPO Dep. File Number DE87001035.

Advanced coal-fueled processes that use high-temperature (1500 F or more) gas cleaning have the potential for significant cost savings. Turbine corrosion control by alkali removal may be needed in such systems. A fixed bed of emathlite pellets had been identified earlier as a promising way to remove alkali metal vapors from hot gases. In the present program we examined the fundamental chemistry of the absorption reaction, demonstrated the removal concept in a bench-scale reactor, and developed the engineering basis for process scale-up. An industrial process for making emathlite pellets by slurry extrusion was defined. Pellet cost was estimated as $0.11 to $0.82 per ton of coal, depending on scale of production. The absorption mechanism was defined and shown to result in a sorbent capacity of 18 wt % sodium. A kinetic model that allows sizing of sorbent beds was developed. It was shown that absorption is effective even at very low gas-phase concentrations. The suggested process was demonstrated in a series of fixed bed tests, using up to 12 kg sorbent, at a hot gas cleanup test facility. Alkali removal of greater than 99% was demonstrated. Kinetics and capacity data indicate that even more removal could have been achieved with deeper beds. It was concluded that reduction of gas-phase sodium to the turbine tolerance of about 20 ppb is feasible with this technique. Example calculations of typical process sorbent consumption rates and reactor size requirements are presented. 7 refs., 46 figs., 39 tabs.

15277 (DOE/MC/20230—T5) CNG acid gas removal process: Technical progress report No. 5, 1 October-31 December 1984. Auyang, L.; Liu, Y.C. (Helipump, Inc., Brecksville, OH (USA)). [1987]. Contract AC21-83MC20230. 45p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE86011514.

Development work on the CNG acid gas removal process under contract No. AC21-83MC20230 continued during the fifth quarter October 1, 1984 through December 31, 1984. Two tasks were active during the quarter: Task 1, triple-point crystallizer (crystallizer modifications and operation); and Task 2, hydrogen sulfide absorber operation. Within Task 1, two control schemes for crystal backwash were tested, and other crystallizer modifications were completed. Flow ratio control was tested satisfactorily and the results are consistent with calculated predictions. Concentration feedback control has also been tested, but the response of this scheme is slow because of the time lag in concentration analysis. Crystallizer modifications include (1) a new flasher filter with finer grid; (2) vertical flasher agitator impellers; (3) a new flasher feed gas/liquid separator; (4) a larger flasher top section; and (5) a compressor cooling fan. Within Task 2, shake-down runs of the hydrogen sulfide absorber have been made. A start-up and operating procedure for the absorber was developed based on experience gained from the shake-down runs. In addition, the sampling and concentration analysis system and the flow measurement system of the process demonstration unit are discussed in this report. 1 ref., 9 figs., 9 tabs.

15278 (DOE/MC/21004—T3) Expansion of high-temperature; high-pressure data set for coal gasification. Fourth quarterly report, June 28-September 28, 1985. Solomon, P.R.; Serio, M.A.; Hamblen, D.G.; Heninger, S.G. (Advanced Fuel Research, Inc., East Hartford, CT (USA)). 1985. Contract AC21-84MC21004. 18p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE86007605.

Eighteen of the runs outlined in the test plan for the high pressure reactor (HPR) using Montana Rosebud coal were done during the fourth quarter, bringing the total number completed to 40. These were all pyrolysis runs and included excursions in temperature, pressure, heating rate, residence time, and particle size. Additional work during the fourth quarter included devising plans for the gas mixing station so that pyrolysis or gasification runs can be done with helium, oxygen, or CO_2 mixed with nitrogen or argon. During the fourth quarter, pyrolysis studies were done at 30 K/min (0.5 K/s) in a combined thermogravimetric analyzer/evolved gas analyzer (TGA/EGA) with Montana Rosebud 200 x 270 mesh coal. We have tried to simultaneously fit kinetic data on two coals (North Dakota lignite and Montana Rosebud) from the TGA/EGA (0.5 K/s) and the heated tube reactor in order to optimize the set of kinetic rates and the coal composition parameters in the Functional Group model. The North Dakota lignite experiments in the heated tube reactor (HTR) and TGA/EGA and the optimization studies were done under our other METC contract. In general, the agreement of the model and the data from the two reactors was good for both coals. We have continued to do measurements of active site area, determined by oxygen chemisorption, surface area, determined by CO_2 absorption, and char reactivity, determined by the time for 50% burnoff in air on chars generated in this program. A comparison was made between our data and predictions by the regression model developed at METC for pyrolysis data from the AGC. In general, there was not good agreement when the METC model was extrapolated outside the range of conditions used in the AGC. 2 refs., 3 figs.

15279 (DOE/MC/21004—T4) Expansion of high-temperature; high-pressure data set for coal gasification. Fifth quarterly report, September 28-December 28, 1985. Solomon, P.R.; Serio, M.A.; Hamblen, D.G.; Heninger, S.G. (Advanced Fuel Research, Inc., East Hartford, CT (USA)). 1985. Contract AC21-84MC21004. 27p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE86010427.

During the fifth quarter, the gas mixing station for the high pressure reactor (HPR) system was completed. This station allows us to make reproducible binary mixtures of any two gases. It will be used for pyrolysis experiments in helium/nitrogen or oxygen/ni-

trogen and gasification experiments in helium/nitrogen or oxygen/nitrogen and gasification experiments in carbon dioxide/nitrogen. In addition, work began on modifications of the HPR system for high pressure (600 psig) operation. A limited amount of data was taken with the HPR system due to the modifications for the mixing station. However, the test plan experiments for pyrolysis in mixtures of helium and nitrogen were completed. In general, there is a slightly higher yield of volatiles and lower yield of char as the helium content (heating rate) increases. A new technique for measuring char reactivity resulted from an Army SBIR program and was further developed under our other METC Contract. It has also been used to characterize chars generated under the current program. It was evident that the severity of the thermal treatment had a direct effect on char reactivity. In this regard, rapid heating to a relatively low temperature was most favorable while slow heating to a high temperature was least favorable. With regard to pressure effects on reactivity, our preliminary data indicated that higher pressures produce chars lower initial reactivity. A total of four experiments were done in the heated tube reactor (HTR) at 60 psig, 800°C maximum tube temperature. The trends are the same as observed in the atmospheric pressure experiments for the same tube temperature and cold gas velocity. During the past quarter, a particle temperature (PT) model was under development for the high pressure entrained flow reactor (HPR). 5 refs., 5 figs.

15280 **(DOE/MC/21004—T5) Expansion of high-temperature; high-pressure data set for coal gasification: Sixth quarterly report, December 28, 1985-March 28, 1986.** Solomon, P.R.; Serio, M.A.; Hamblen, D.G.; Heninger, S.G. (Advanced Fuel Research, Inc., East Hartford, CT (USA)). 1986. Contract AC21-84MC21004. 23p. NTIS, PC A02/MF A01; GPO Dep. File Number DE86013230.

During the sixth quarter, work was completed on modifications of the high pressure reactor (HPR) system for higher pressure (600 psig) operation. A series of pyrolysis experiments was completed in the HPR using mixtures of nitrogen and oxygen at various pressures and compositions. The original intention of the O_2/N_2 experiments was to examine the effects of oxygen on the pyrolysis product distribution and the char reactivity. Unfortunately, at the temperature, residence time and pressure used for most of the experiments in this series (817°C, 0.47 s, 26 psig) nearly complete oxidation of the char and volatile products occurred. Additional CO_2 gasification experiments were done to provide a database for revising the test plan. These were done at a variety of temperatures, pressures and CO_2 concentrations. The reactor was then switched back to nitrogen and additional pyrolysis experiments were done at high pressure (300 psig). When it was observed that the material balance was falling off slightly, it was decided to repeat some of the previous pyrolysis experiments at low pressure. There appeared to be a small, but systematic, reduction in char recovery. We continued to do char reactivity and surface area measurements for chars using the new non-isothermal technique described in the Fifth Quarterly report. A comparison was made of the results for char, tar, and gas yields for 1 atm and 5 atm (60 psig) experiments in the HTR. The asymptotic yield of about 10% was similar for both sets of experiments. A comparison was also made of tar yields for the Montana Rosebud coal from experiments in the HPR and HTR. The observed tar yields were in good agreement for similar experimental conditions. A preliminary version of a particle temperature model for the HPR was completed during the past quarter. 9 refs., 2 figs., 3 tabs.

15281 **(DOE/MC/22059—2268) Entrained flow gasification at elevated pressure: Quarterly technical progress report No. 7 for the period 1 September 1986 to 30 November 1986.** Hedman, P.O.; Smoot, L.D. (Brigham Young Univ., Provo, UT (USA). Combustion Lab.). 31 Dec 1986. Contract AC21-85MC22059. 52p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87003927.

The three main tasks of this study are: (1) entrained coal gasification measurements, which include elevated pressure tests of three coal types, investigation of injector design, cold-flow measurements in simulated gasifier flows, and investigation of advanced optical diagnostic techniques that could be applied to gasification measurements; (2) improvement of the computer code for gasification processes, including improvement of physical submodels and numerical methods, and comparison of model predictions with experimental results for code validation; and (3) application of results to industrial and METC needs through technical seminars, expansion of a detailed data book, and distribution of the code to other users, including METC. Accomplishments for each of these tasks are presented. 36 refs., 11 figs., 5 tabs.

15282 **(DOE/PC/63032—T16) Bench scale development of the TRW process for cleaning coal (gravimelt process): Quarterly technical progress report for the period February 1985-April 1985.** (TRW Space and Technology Group, Redondo Beach, CA (USA)). May 1985. Contract AC22-83PC63032. 13p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87005394.

Emphasis this quarter has been on preparation and submittal of topical reports for the regeneration, coal-caustic reaction studies and filtration tasks of the project and on the selection of a continuous cocurrent reactor for the 20 lb/hour modular Gravimelt Process unit. In addition, permission was received from the Department of Energy to initiate the Task 9 regeneration section scale-up activity which will result in construction and testing of a 20 lb/hour regeneration system which will ultimately be incorporated as a part of the 20 lb/hour Gravimelt Process modular test unit.

15283 **(DOE/PC/72008—T8) Development of a microwave coal cleaning process: Technical progress report for March 1985-May 1985.** (TRW Space and Technology Group, Redondo Beach, CA (USA). Energy Div.). Jun 1985. Contract AC22-84PC72008. 48p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005382.

The objective of the program is to conduct bench scale studies to evaluate a process using microwave irradiation of caustic treated coal to remove sulfur and ash from coal. The program is organized into three tasks: equipment design and installation, shakedown testing, and process testing. This report covers the results from the design and installation activities during the report period and includes a description of the process and equipment as well as the status of equipment selection equipment procurement and installation, shakedown test plan preparation, and sampling and analysis procedure preparation and validation testing. 16 figs., 1 tab.

15284 **(DOE/PC/80016—T2) Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Final quarterly technical progress report No. 4 for the period 1 July to 30 September 1986.** McCarty, J.G.; Wilson, R.B.; Tong, G.T. (SRI International, Menlo Park, CA (USA)). 12 Nov 1986. Contract AC22-85PC80016. 21p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005037.

We have made significant progress in developing novel catalysts for the Fischer-Tropsch synthesis (FTS). The stoichiometries of the cluster synthesis and surface-confining reactions on an alumina support for aluminum tetra- and aluminum hexa-ruthenium hydridocarbonyl cluster catalysts were determined by gas evolution measurements. Characterization with FTIR and NMR spectroscopy of the cluster intermediates is also consistent with the observed cluster catalyst stoichiometry, Al_2O_3-$Al(C_2H_5)$-$Ru_4H_3(CO)_{12}$ and Al_2O_3-$Al(C_2H_5)$-$Ru_6H(CO)_{18}$. Activation of the surface-confined supported cluster complex by heating to 573 K in inert gas or hydrogen is likely to produce a stabilized cluster catalyst due to affinity of aluminum for alumina and the strength of the aluminum-ruthenium bonds relative to ruthenium-ligand bonds. The cluster catalysts were tested for FTS in 2:1 H_2:CO syngas at 523 K and 1 atm. The 0.6 wt % Ru_4 catalyst had superior activity and about the same selectivity through C_5 hydrocarbons as a commercial alumina-supported 0.5 wt % Ru catalyst. The 1.2 wt % Ru_6 catalyst was less active but had similar selectivity. Substantial changes in selectivity of standard-fused iron catalysts were found following treatment to uniformly chemisorb submonolayer quantities of sulfur. Approximately 40% of a monolayer of sulfur was slowly adsorbed at 473 K on the potassium-promoted fused iron catalyst following reduction and passivation by accumulation of a surface layer of carbon and CO. The passivating layer was removed and the sulfur was locally dispersed by heating to 1000 K in hydrogen. The treated catalyst had a three-fold reduction in methane selectivity-relative to untreated reduced fused iron at 573 K, and the C_2 olefin yield approached 100%. 7 refs., 1 fig., 3 tabs.

15285 (DOE/PC/80023—T7) Development of an in-situ hydrogen measuring instrument for coal liquefaction processes: Quarterly report, October-December 1986. Klinzing, G.E. (Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering). 1986. Contract AC22-85PC80023. 39p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004902.

The hydrogen probe consisting of the three units, flowmeter, laser, sensing device, nickel tubing probe and computer were shipped to Wilsonville in June. The operation of installation was impeded by the presence of dirt in the hydrogen delivery line to the probe. This caused a clogging of the multiport valve. The valve after cleaning still did not operate in the full cycle as anticipated. It was disassembled from the unit and tested in the university laboratory facility. After several tests, it was found that the valve is working properly with no problems and it is now ready to be placed again in the Wilsonville facility for the testing to resume. (AT)

15286 (DOE/PC/80526—T6) Chemical trapping of CO/H_2 surface species: Quarterly report. Blackmond, D.G.; Wender, I. (Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering). Jan 1987. Contract FG22-85PC80526. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005181.

The work on the project during the last quarter has focused on the design and construction of a system that will allow us to better investigate how a model organometallic complex may serve as a system analogous to that of the metal catalyst-adsorbate bond. We have also made considerable modifications to the reaction system for performing in-situ trapping reactions concurrent with the catalytic CO + H_2 reaction. Positive preliminary results involving chemical trapping of RuY zeolites in situ during CO hydrogenation have led to further exploration of Ru on other supports. The action of the trapping reagent appears to be complex in nature, involving a number of processes in addition to the alkylation of surface-carbon or surface-oxygen bonds. The presence of I in CH_3I suppresses hydrogenation. Large amounts of the reagent effectively poisons the catalyst surface, but very small amounts (<0.1%) may actually enhance hydrogenation. Ru on other supports seems to deactivate much more quickly than RuY zeolite under trapping conditions. The new experimental system for trapping reactions promises to allow us to expand this work greatly to other catalyst systems. 2 figs.

15287 (DOE/PC/90529—1) Micropore diffusion in coal chars under reactive conditions: Quarterly technical progress report, 15 September 1986-15 December 1986. Calo, J.M. (Brown Univ., Providence, RI (USA). Div. of Engineering). 1986. Contract FG22-86PC90529. 22p. NTIS MF A01; 2; GPO Dep. File Number DE87004915.

This project is concerned with the development of a new technique for measuring the rates of diffusion of gases on the microporous structure of coal chars. Mass transport in pores of molecular dimensions is known to be an activated, relatively slow process. The gasification of coal chars may be transport-limited. To correlate and predict gasification reactivity, it is quite important to know over what range of conditions such limitations may control. The initial transient behavior of a gaseous species exposed to such chars primarily reflects the transport resistance offered by the micropores. When this process is conducted using a well-defined perturbation in a mixed reactor, the diffusion step can often be separated from the subsequent reaction steps, so that measurements can be conducted under actual gasification conditions. We will apply this technique to a few well-characterized coal/carbon chars. Micropore diffusion times in these samples will be determined for various gaseous species relevant to the gasification environments. The primary variables will be temperature and degree of conversion (i.e., burn-off). Measurements will be examined with respect to changes occurring in the pore structure of the chars. In this first quarterly technical progress report, the background and objectives of the study and the requisite experimental preparations to begin the micropore diffusion studies are presented. In particular, during the reporting period: the graduate assistant on this project conducted a literature review of the general area of micropore diffusion and began to acquire the necessary background for the experimental study; the inception of a pore model was undertaken involving micropore diffusion; and the Autoclave Engineers 3" Berty catalytic reactor has been refurbished and modified for the study. 59 refs., 2 figs.

15288 (EPRI-AP—5029) Pilot plant evaluation of Illinois No. 6 and Pittsburgh No. 8 coal for the Texaco coal gasification process: Final report. Richter, G.N.; Barot, D.T.; Crotty, J.M. (Texaco, Inc., South El Monte, CA (USA). Montebello Research Lab.; Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. 31p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920251.

The extended pilot plant evaluation was conducted at Texaco's Montebello Research Laboratory to determine the suitability of Illinois No. 6 and Pittsburgh No. 8 coals as feedstock for the Texaco coal gasification process. The gasifier was operated for 10.5 days on Illinois No. 6 coal and for 9.2 cumulative days on Pittsburgh No. 8 coal at wide range of operating conditions. The test results were evaluated to determine the operability of the process and the effects of changes in operating variables on the gasification performance. Based on the pilot unit test results, both the Illinois No. 6 and the Pittsburgh No. 8 coals were found to be acceptable feedstocks for the Texaco coal gasification process and operating guidelines for testing these coal at Cool Water were proposed. 2 figs., 5 tabs.

15289 (NP—7770049) Investigation of extraction of a model mixture similar to coal oil with supercritical gases. Prange, M. (Paderborn Univ. (Gesamthochschule) (Germany, F.R.). Abt. fuer Naturwissenschaften 2). 10 Jan 1986. 153p. (In German). NTIS (US Sales Only), PC A08/MF A01. File Number DE87770049.

In order to make the identification and quantitative determination of individual components possible, a model mixture consisting of 18 components was substituted for a coal medium oil (boiling point 180/sup 0/C to 350/sup 0/C). Extraction experiments were carried out in varying conditions in a high pressure apparatus designed for this purpose. The pressure (5 to 30 MPa), the temperature (308 to 338 K) and the extraction gases used (CO/sub 2/, trifluormethane (Frigen 23)) were varied in these experiments. In order to examine the distribution coefficients and separation factors at various compositions of the mixture, the quantity ratios of the different groups of materials (alkanes, aromatics and phenols) in the mixture used were varied during extraction with Frigen 23 in constant extraction conditions (308 K, 10.8 MPa). Series of measurements were also taken, in which a solvent competing with the extraction gas was added, in order to increase the structure selectivity (CO/sub 2//benzyl alcohol/model mixture and Frigen 23/n-undecane/model mixture). In order to examine to what extent the measured data can be represented by a theoretical expression for such a phase equilibrium, fugacity coefficients or enhancement factors were calculated for the alkanes in the CO/sub 2//model mixture system using the Peng-Robinson state equation. These calculations agreed closely with the measured values. The results of this work show that the fractionation of a mixture, which contains components with different functional groups and different vapour pressures, is only possible to a certain extent. Also, because of the small separation factors, the enrichment which can be achieved in a single stage process is small, satisfactory separation results can only be achieved in a multi-stage separation process.

15290 (ORNL/Sub—81-69611/02) Evaluation of advanced materials for severe slurry erosion service: Final report. Wright, I.G.; Shetty, D.K.; Clauer, A.H.; Stropki, J.T. (Battelle Columbus Div., OH (USA); Oak Ridge National Lab., TN (USA)). 1986. Contract AC05-84OR21400. 300p. NTIS, PC A13/MF A01; 1; GPO Dep. File Number DE87005161.

This report describes results from a study of the erosion behavior of selected WC-Co cermets, ceramic composites, and coatings in a well-controlled slurry test designed to simulate conditions pertinent to valves and pumps operating in coal-derived slurries. For a well-characterized series of WC-Co cermets (having a carbide grain size of approximately 1μm) it was found that the erosion

rate decreased systematically with increasing alloy hardness (and decreasing cobalt volume fraction). The various modes of material removal contributing to the overall erosion loss were identified from a study of the erosion damage resulting from incremental erosion exposures. These were used to formulate a semi-empirical model which describes the erosion rate of these alloys as a function of various structure-property relationships, and requires only the measurement of the erosion rate of pure cobalt under the conditions of interest. A series of ceramics exhibited erosion behaviors which could be categorized either as intergranular (brittle) or as transgranular/microflaking (ductile). Those ceramics which exhibited the transgranular mode of erosion in general eroded at a much slower rate than those which eroded by the intergranular mode. Ceramic-ceramic composites were shown to be capable of reasonable resistance to erosion; contrary to expectation, it was found that the matrix [in this case chemical-vapor deposited (CVD) silicon carbide] exhibited a higher erosion rate than the fiber phase. Coatings of CVD titanium diboride were found to be capable of providing excellent erosion resistance. However, the erosion behavior was very dependent on detailed coating conditions. 40 refs., 124 figs., 22 tabs.

15291 (PNL—5500-Pt.4, pp 1) **Characterization of metabolites and DNA adducts arising from direct coal liquids exposure.** Lucke, R.B.; Wilson, B.W.; Springer, D.L. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

An area of increasing interest in the past year has been the metabolites formed from coal liquid chemical fractions and from pure compounds representative of those found in coal liquids. Separation of metabolic products formed in vitro using rat liver S-9 and in vivo using mouse skin has been developed. The further reaction of these metabolites with DNA to form adducts has also been investigated with the ultimate goal of isolating and identifying the coal liquid metabolite/DNA adduct. Such data will help to identify directly those specific compounds metabolized by the organism in such a manner as to ultimately bind to cellular DNA and thereby, assumedly, to initiate eventual development of tumor growth.

15292 (PNL—5500-Pt.4, pp 2) **Determination of chemical properties and toxicologic activity of hydroaromatic species in coal liquefaction products.** Later, D.W. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Coal liquefaction products are primarily composed of polycyclic aromatic hydrocarbons (PAH) and their nitrogen, oxygen and sulfur derivative species. When subjected to catalytic hydrogenation conditions during liquefaction, PAH compounds lose aromaticity as hydrogen is incorporated into their molecular structure. Catalytic hydrogenation is currently being used as an integral process stage in contemporary, multiple-stage direct coal liquefaction facilities. Catalytic hydrogenation is used principally because it increases conversion efficiencies and H/C ratios and reduces levels of biological activity in laboratory assay systems. Analytical methods for the qualitative and quantitative determination of the hydroaromatic compounds, as well as understanding the impacts of catalytic hydrogenation on the biological activity of PAH, have therefore been of increase interest.

15293 (PNL—5500-Pt.4, pp 3) **Chemical characterization of materials from a close-coupled catalytic-catalytic two-stage coal liquefaction process.** Wilson, B.W.; Later, D.W. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Close-coupled two-stage liquefaction (CCTSL) is a coal conversion process in which both reactor stage contain a catalysts. No distillation or solids separation is carried out between stages, however, distillation and filtration are used to separate the final product material from the process stream leaving the second reactor. An objective of this process approach is to take maximum advantage of catalytically promoted reactions in converting coal. Materials from this process, including tetrahydrofuran (THF) extracts of first and second stage reactor products, were assayed for chemical composition and mutagenic activity. The data were then used to compare these materials to analogous streams from other single- and two-stage technologies. Mutational assays using the standard plate incorporation version of the histidine reversion assay with Salmonella typhimurium TA98 showed that the mutagenic activity of the crude extracts was relatively low.

15294 (PNL—5500-Pt.4, pp 7-8) **Supercritical fluid chromatography and mass spectrometry.** Smith, R.D.; Wright, B.W.; Udseth, H.R. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

At Pacific Northwest Laboratory (PNL) supercritical fluid methods are being developed for materials where conventional gas or liquid chromatographic methods and existing mass spectrometric methods are inadequate. The advantages of supercritical fluid chromatography (SFC) accrue from the nature of supercritical fluids. The solvating properties of supercritical fluids mobile phases approach those of liquid phases, yet solute diffusivity typically remains one to two orders of magnitude higher. These properties allow high separation efficiencies to be realized while exploiting the variable and often high solvating power of the supercritical fluid. Consequently, SFC has the capability of separating thermally labile and nonvolatile solutes and can do so with higher efficiencies than liquid chromatography. The introduction of the total chromatographic effluent into the mass spectrometer can be accomplished through the direct fluid injection (DFI) interface developed at PNL. The coupling of capillary SFC with mass spectrometry (SFC-MS) offers significant advantages over existing high performance liquid chromatography-MS combinations.

15295 (PNL-SA—14167) **Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis.** Wright, C.W.; Chess, E.K.; Stewart, D.L.; Mahlum, D.D.; Wilson, B.W. (Pacific Northwest Lab., Richland, WA (USA)). Sep 1986. Contract AC06-76RL01830. 23p. (CONF-8610220—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE87002870.

From DOE contractors meeting; Pittsburgh, PA, USA (21 Oct 1986).

The purpose of this manuscript is to report the preliminary results of the chemical analysis and toxicological testing of feedstock and product samples from two different DOE-funded co-processing technologies, and to compare these results to those obtained from two-stage coal liquefaction materials. Co-processing samples were provided from (a) run 3 of the catalyzed, slurry, single-stage co-processing technology of UOP, Inc., during lined-out operations of plant 558 with a Lloydminster petroleum resid and Illinois No. 6 coal and (b) runs CTS-5 and -6 of the two-stage, close-coupled, Lummus Crest, Inc. (LCI), co-processing pilot plant during lined-out operations with an Arabian heavy petroleum resid and Pittsburgh seam coal. Selected feed and product stream samples were chemically characterized using the following techniques: chemical class fractionation by adsorption column chromatography, gas chromatography, gas chromatography/mass spectrometry, low-voltage probe-inlet mass spectrometry, field desorption (FD) mass spectrometry, and nuclear magnetic resonance (nmr) spectroscopy. The biological activities of selected crude co-processing samples and chemical class fractions were measured using the standard histidine reversion microbial mutagenicity assay and an initiation/promotion assay for tumorigenicity in mouse skin. In addition to feed and product stream comparison of the co-processing samples, the results of the analyses and testing of the co-processing product streams were compared to results from similar analyses of two-stage direct coal liquefaction (TSL) products. 15 refs., 10 figs., 6 tabs.

15296 **Analysis of a two-stream direct coal-gasification system.** Hanjalic, K.; Sijercic, M.; Crowe, C.T.; Wojcicki, S. (Univ. of Sarajevo, Sarajevo). pp 169 of Proceedings of the twenty-first symposium (international) on combustion. Pittsburgh, PA; Combustion Institute (1986). (CONF-860804—).

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

The wide variety of schemes proposed for the gasification of coal can be categorized according to the source of energy for gas-

ification. Gasification schemes in which the energy is supplied by a source removed from the gasification process are classified as external-source systems while other schemes in which the energy is derived from a source which is part of the gasification process are identified as internal-source systems.

15297 **Steam gasification of carbonaceous solids catalyzed by a mixture of potassium and nickel oxides below 1000 K.** Carrazza, J.; Somorjai, G.A.; Heinemann, H. (Materials and Molecular Research Div., Lawrence Berkeley Lab., Univ. of California, Berkeley, CA 94720). *Preprints of Papers, American Chemical Society, Division of Fuel Chemistry;* 31: No. 3, 158-165(1986). (CONF-8609181—). Contract AC03-76SF00098.

From ACS symposium on syngas conversion catalysis advances in gasification; Santa Clara, CA, USA (7 Sep 1986).

The gasification of carbon with water vapor is an important reaction in the industrial production of H/sub 2/, CH/sub 4/, CO and CO/sub 2/. The use of catalysts is necessary if the process is carried out at temperatures below 1400 K. Two recent reviews discuss the properties of the various catalysts used for this purpose. Alkaline and alkaline-earth hydroxides and carbonates are the catalysts most commonly studied. These compounds only show catalytic activity at temperatures above 1000 K. Previous work shows that below this temperature KOH reacts stochiometrically with graphite and water vapor to produce H/sub 2/ and a stable surface compound. Transition metals, in particular nickel and iron, are able to catalyse this process at temperatures as low as 750 K, but they deactivate much faster than the alkaline and alkaline-earth salts. Several authors have reported that nickel and iron are only active as catalysts for this process if the reaction conditions favors their presence in the metallic state. The authors have recently reported that several mixtures of a transition metal oxide with potassium hydroxide are excellent catalysts for the gasification of graphite with steam. These catalysts are active at temperatures much lower than the alkaline and alkaline-earth salts and they deactivate more slowly than nickel and iron. In this previous publication it was shown that there is a synergistic effect between the transition metal and potassium. This communication summarizes recent results in the study of this type of catalyst. The authors have focused on the use of mixtures of potassium hydroxide and nickel oxide, since they showed the highest activity of all the systems previously studied.

15298 **Oxygen chemisorption as a tool for characterizing "young" chars.** Suuberg, E.M.; Calo, J.M.; Wojtowicz, M. (Div. of Engineering, Brown Univ., Providence, RI 02912). *Preprints of Papers, American Chemical Society, Division of Fuel Chemistry;* 31: No. 3, 186-193(1986). (CONF-8609181—).

From ACS symposium on syngas conversion catalysis advances in gasification; Santa Clara, CA, USA (7 Sep 1986).

The introduction of the concept of active surface area (ASA) as measured by oxygen adsorption had led in recent years to various attempts to correlate char reactivity towards oxygen-containing gasification agents (e.g., CO/sub 2/). As may be seen from the literature, this approach has met with some, although not universal, success. Theories have been advanced which suggest that only a portion of active sites may participate in actual gasification reactions. Hampering a fundamental understanding of what the role of active sites might be is lack of information on their nature. A wide variety of conditions has been suggested for measurement of ASA, generally involving temperatures in the range from 100°C to 350°C and oxygen pressures from fractions of a torr to atmospheric. Only in a few cases have these conditions been critically evaluated. In this paper, a series of experiments is reported upon, which seek to establish the importance of these conditions on determining the ASA of "young" chars (i.e., not heat treated for extended times).

15299 (PNL—5500-Pt.4, pp 2-3) **Chemical analysis of coal-derived materials in commercial use.** Wright, C.W.; Later, D.W.; Wilson, B.W. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Extensive chemical class separations and chemical analyses were carried out on coal-tar-based topical agents (including shampoo, bath emulsion and pharmaceutical stock coal tar solutions in alcohol) used in symptomatic treatment of certain skin disorders. The chemical and toxicological properties of these materials were of interest because they have been used for several decades and yet there is no statistically significant indication of increased cancer risk in the exposed population. Results of these studies showed that, in general, there was little difference chemically or toxicologically between the coal tar fraction that was extracted from these preparations and from a National Bureau of Standards (NBS) standard coal tar. All samples tested showed initiation activity in the initiation/promotion assay. In microbial mutagenicity assays with Salmonella typhimurium TA98 each of the extracts or samples showed activity except for a bath emulsion prepared with irradiated coal tar. It was assumed that ionizing radiation may have destroyed the amino-polycyclic aromatic hydrocarbons (APHA) that are known to give rise to mutagenic activity in this assay.

15300 **(CONF-860911—26) Mild oxidative solubilization of coal macerals.** Winans, R.E.; Hayatsu, R.; McBeth, R.L.; Scott, R.G.; Botto, R.E. (Argonne National Lab., IL (USA)). 07 Sep 1986. Contract W-31109-ENG-38. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004950.

From 192. American Chemical Society national meeting; Anaheim, CA, USA (7 Sep 1986).

The objective of this study is to solubilize coal macerals and an Argonne Premium Coal Sample using oxidation and to characterize these soluble products. A major problem in coal characterization and in coal utilization is the intractability of the coal macromolecular network. High temperature treatments yield smaller, volatile and soluble molecules, which can be greatly altered from their original structures, along with a significant amount of a non-volatile char. Mild oxidation should provide a soluble mixture of compounds in higher yields and with structural characteristics more like the original coal. The approach described in this paper attempts to oxidatively cleave only activated banzylic sites in the coal macromolecules in a two step process. In the first step benzylic sites which are partially active due to oxygen functionality either on the aromatic ring or on the benzyl carbon are further activated by the formation of pyridinium salts at that carbon from the reaction with pyridine and iodine. In the second step this carbon is oxidized by alkaline silver oxide resulting in formation of carboxylic acid groups. This report focuses on the yields of the oxidation step and the characterization of the products. In this study, both smaller and higher molecular weight fractions which were separated on the basis of solubility have been characterized in using gel permeation chromatography (GPC), GCMS, Pyrolysis MS (PyMS) the precise mass measurement mode, Fast Atom Bombardment (FAB) MS, and NMR. FAB MS has proven to be useful in the characterization of polar biological compounds. 6 refs., 6 figs., 1 tab.

15301 **(DOE/PC/60039—11) Phase behavior of coal fluids: Data for correlation development: Report for the period August 1, 1986 to October 31, 1986.** Robinson, R.L. Jr. (Oklahoma State Univ., Stillwater (USA). School of Chemical Engineering). 1986. Contract FG22-83PC60039. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004912.

The effective design and operation of processes for conversion of coal to fluid fuels require accurate knowledge of the phase behavior of the fluid mixtures encountered in the conversion processes. Multiple phases are present in essentially all stages of feed preparation, conversion reactions and product separation; thus, knowledge of the behavior of these multiple phases is important in each step. The overall objective of the author's work is to develop accurate predictive methods for representation of vapor-liquid equilibria in systems encountered in coal-conversion processes. During the present report period, data were obtained on CO_2 + benzene at 40, 50 and 100°C to complement our previous measurements on

CO_2 in two-, three- and four-ring aromatic solvents. As with our previous data, the Soave and Peng-Robinson equations provide good representations of the solubilities when two interaction parameters (C_{12}, D_{12}) are employed. However, unlike the CO_2 + n-paraffin systems, interaction parameters for the CO_2 + aromatic systems have not been adequately correlated in terms of the solvent molecule properties. 10 refs., 3 figs., 2 tabs.

15302 **(DOE/PC/80505—T5) Viscosity of synfuel compounds and mixtures: Fifth quarterly progress report, 10/1/86-12/31/86.** (Maryland Univ., College Park (USA)). 1986. Contract FG22-85PC80505. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004588.

A method was investigated to measure the viscosity of a compressed liquid without a priori knowledge of the density by determining both the viscosity and the density from the damping and the period of an oscillating disk suspended in the fluid. The feasibility of the method was demonstrated experimentally for liquid toluene at temperatures from 25°C to 125°C and at pressures up to 30 MPa. Measurements of the viscosity of transdecalin and tetralin with capillary-flow viscometry were initiated. 6 refs.

15303 **(DOE/PC/80529—T4) Effects of coal structure on pulverized coal combustion processes: Quarterly technical progress report No. 5 for the period September 1, 1986 to 31 December 1986.** Wells, W.F.; Smoot, L.D. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). 31 Jan 1987. Contract FG22-85PC80529. 18p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87005025.

The general objective of this study is to define and quantify the relationships between coal composition and the structure and associated combustion and conversion behavior for three very different domestic coals of interest. During this past quarter, nitrogen BET surface area was measured for the size-graded fractions of Wyoming subbituminous and North Dakota lignite coals. Preliminary tests of the temperature programmed reaction method were conducted. Design of a pyrolysis reactor is given. The tungsten ribbon lamp to be used for calibrating the optical pyrometer system was calibrated for temperature as a function of input voltage. The measured temperatures were corrected for the non-blackbody behavior of tungsten. Design of a coded-aperature to enable measurement of particles down to 20 microns is given. Plans are also presented for the following quarterly period. 15 refs., 4 figs., 1 tab.

15304 **(DOE/PC/80533—T5) Structural characterization/correlation of calorimetric properties of coal fluids: Fifth quarterly report, September 1, 1986-December 31, 1986.** Starling, K.E.; Mallinson, R.G.; Li, M.H.; Peters, M.W.; Hulvey, R.D. (Oklahoma Univ., Norman (USA). School of Chemical Engineering and Materials Science). 1986. Contract FG22-85PC80533. 15p. NTIS MF A01; 2; GPO Dep. File Number DE87004911.

Calibrations for the determination of hydroxyl, primary amine, and secondary amine functional groups by infrared (IR) spectroscopy have been completed. The model compounds 1-naphthol, 1-aminonaphthalene, and carbazole were used for these calibrations. The IR analysis of the coal fluids is nearly complete. Elemental analysis of the samples is also proceeding and is nearing completion. Functional group contributions to ideal gas heat capacities and enthalpies were extended, based on model compounds, to low temperature regions. The functional group contributions were determined for temperatures ranging from 0 K to 1000 K. The results of the evaluation are tabulated for ideal gas heat capacity and enthalpy in Tables 2 and 3, respectively. The ideal gas heat capacity and enthalpy calculations were performed for pure compounds based on the following two cases: Case I. The ideal gas calorimetric properties were determined using functional group contributions by Benson's Method (Benson, 1968; Benson et al., 1969). Case II. The ideal gas calorimetric properties were determined using functional group contributions based on model compounds. A summary of the results is presented for ideal gas heat capacities and enthalpies. 3 refs., 5 figs., 5 tabs.

15305 **(NMRDI—2-74-4122) Diffusion of gases in New Mexico coals: Final technical report.** Williams, F.L.; Smith, D.M. (New Mexico Univ., Albuquerque (USA). Dept. of Chemical and Nuclear Engineering; New Mexico Univ., Albuquerque (USA). New Mexico Research and Development Inst.). Feb 1987. 53p. New Mexico Research and Development Institute, Suite M, 457 Washington S.E., Albuquerque, NM 87108. File Number DE87900515.

As part of the first phase of this study, characterization of the pore volume and surface area of coal was principally undertaken while the more extensive and complex diffusivity and high-pressure adsorption experiments were being built. The careful characterization work resulted in new understanding of the limitations of mercury porosimetry and nitrogen adsorption analysis for coal. Our results indicate that as the size of coal particles in a sample decreases, a spurious, intruded-pore volume is indicated in mercury porosimetry. Furthermore, at higher pressures of Hg, the penetration of Hg may actually be a measure of micropore crushing rather than pore structure information. Nitrogen adsorption measurements do not reflect the total surface area of the coal which is easily accessed and measured by carbon dioxide. At the same time we found that condensation of nitrogen and NMR relaxation experiments may lead to significantly new interpretations of coal porosity. We find that measurements of condensation of nitrogen gives a direct measure of large pore volume that can be contrasted to total pore volumes. Preliminary NMR results show remarkable differences in apparent pore structure for similar New Mexico coals. The extension of basic science of coal structure and development of a potential new method for characterization of coal are major, long range impacts of this work. 41 refs., 9 figs., 6 tabs.

15306 **(NP—7900481) New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year.** Coleman, G.N. (Alabama Univ., University (USA). School of Mines and Energy Development). 1986. 40p. SOMED, Box 6282, Univ. of Alabama, Tuscaloosa, AL 35487. File Number TI87900481.

A slurry nebulization method for the determination of major, minor, and trace elements in coal has been developed. Coal samples are chopped to less than 100 mesh, then weighed into a micronizing mill. Using dilute nitric acid as a wetting agent, samples are micronized for 7 minutes. The resulting slurry is diluted and nebulized into a direct current plasma excitation source for analysis via emission spectrometry. Recoveries for most elements are better than 90%. Aluminum and chromium yielded variable results between 10% and 80%. Since particle size measurements indicate that aerosol transport should be efficient, variable recoveries are most likely due to inadequate sample/plasma contact time for the decomposition of refractory materials. 32 refs., 5 figs., 9 tabs.

15307 **(SECV-SO—86-102) Characterisation of insoluble residues from the hydrogenation of Victorian brown coals.** Mackay, G.H. (State Electricity Commission of Victoria, Melbourne (Australia)). 1986. 65p. NTIS.

Project no. 51-09.

During the hydrogenation of brown coal to liquid products some insoluble material, both carbonaceous and inorganic, always remains as a residue. Residues from a wide range of reaction conditions have been examined, principally by optical microscopy but also by scanning electron microscopy. The petrography of hydrogenation residues from brown coal is described in detail in this report. Also reported is the variation in the nature of residues with reaction conditions and the diagnosis of operational difficulties with hydrogenation plant from the petrographic examination of blockages. 22 references.

15308 **Investigation of coal hydrogenation using deuterium as an isotopic tracer.** Skowronski, R.P.; Heredy, L.A.; Rutlo, J.J. (Rockwell Intl., Canoga Fork, CA). pp 207-228 of Atomic and nuclear methods in fossil energy research. Filby, R.H. New York, NY; Plenum Press (1982).

Mechanisms of coal hydrogenation were investigated by using a deuterium tracer method. This method makes it possible to determine which structural positions in the coal react with hydro-

gen during liquefaction. A hydrogenation index (HI) and exchange index (EI) were formulated to measure the amount of deuterium incorporated due to hydrogenation and exchange reactions, respectively. In the coal-deuterium system, deuterium incorporation was found to vary both with product fraction and with structural position. In contrast, the deuterium contents of the fractions from donor solvent experiments were essentially uniform. The donor solvent experiments did, however, show preferential deuterium incorporation with respect to structural position. Important information with regard to the reaction mechanisms in the donor solvent system was obtained by analyzing the spent solvent mixture that was recovered from the reaction products. The results indicate that not only hydrogen donation but also hydrogen exchange involving the α-positions of tetralin can have a significant role in stabilizing the fragments that form during the thermal decomposition of the coal. In addition, evidence was obtained that there is also a direct route for deuterium incorporation into the coal products from the gas phase without the participation of tetralin.

15309 **(CRIEPI—484014) Physical properties of cultivated soils mixed with coal ash as ameliorant.** Okabe, K. (Central Research Inst. of Electric Power Industry, Abiko, Chiba (Japan)). 1986. vp. (In Japanese). NTIS.

This study was carried out to promote the utilization of coal ash from coal-fired power plant as soil improving agent by mixing with agricultural soil. Fly ash and bottom ash were mixed with four soils (alluvial soil, volcanic ash soil, Masa soil, and sand) at the mixing rates of 0, 10, 30 and 50% respectively. Physical parameters such as soil texture, bulk density, three phase of soil, hydraulic conductivity, and water retention curve were measured. By fly ash application, there were consistent increases in fine sand and silt ratio, bulk density, solid ratio, and water-holding capacity, and a decrease in hydraulic conductivity (except alluvial soil). By bottom ash application, there were increases in coarse sand ratio, porosity, and hydraulic conductivity in all soils tested. Fly ash application was effective to improve physical properties of sandy soil. Bottom ash was effective to improve physical properties of alluvial and Masa soil.

15310 **(DOE/FE/60181—2271) Low-rank coal research: Quarterly technical progress report for the period April-June 1986.** (North Dakota Univ., Grand Forks (USA). Energy Research Center). Sep 1986. Contract FC21-83FE60181. 220p. (DOE/UNDERC/QTR—86/2). NTIS, PC A10/MF A01; 1; GPO Dep. File Number DE87005885.

The UNDERC quarterly report involves testing use of cooling water made up of heated Great Plains gasification plant waste water, the preparation of coal slurries made of hot water dried low rank coal, boiler fouling by ash deposits, fluidized-bed combustion (including materials testing), slurries and particulates combustion, pyrolysis, devolatilization, etc.

15311 (EPRI-CS—4918-Vol.3, pp 5.1-5.18) **Advanced ESFF applied to a stoker coal-fired boiler.** Greiner, G.P.; Viner, A.; Hovis, L.S.; Gibbs, R. Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

The ability of an electrostatically stimulated fabric filter (ESFF) to operate at a lower average pressure drop or a higher gas-to-cloth (G/C) ratio than a conventional fabric filter has been successfully demonstrated in the laboratory and in studies at two pilot plants with pulverized coal ashes. Those investigations involved the use of an electric field oriented parallel and in close proximity to the surface of the bag fabric. Recent laboratory investigations have shown that a center wire electrode, producing an electric field perpendicular (rather than parallel) to the surface of the fabric, produced as good or better results. This configuration has the potential advantages of operating on conductive dusts, with standard fabrics, and with less complicated electrode design when applied to reverse air or shaker baghouses. In order to evaluate the center wire configuration in the field, a pilot baghouse was installed on a slipstream of an industrial coal-fired stoker boiler. The pilot plant contains 8 in. diameter by 24 ft woven glass bags, employs reverse air cleaning, and can process 700 acfm of flue gas. Within the standard reverse air baghouse, individual bag flow monitors (IBFMs) are used to evaluate the fabric drag characteristics of each bag, allowing comparison of variables within the common module. Bags with and without electrical enhancement are compared. The pilot plant includes a data collection system that continuously monitors all key operating parameters, including individual bag flow, locally stores this data for several days, and transmits via telephone lines to both ETS and RTI offices for analysis. 1 reference, 8 figures, 1 table.

15312 (EPRI-CS—4918-Vol.3, pp 9.1-9.16) **Laboratory studies of the filtration performance of various filter media under simulated field conditions.** Frankenburg, P.E. (E.I. du Pont de Nemours & Co., Wilmington, DE). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Using laboratory equipment which simulates use conditions in the field, a number of filtration media for coal-fired boilers were studied. The filters were operated in the pulse-jet mode. Variables studies included: dust source, including various fly ashes and other dusts, air/cloth ratio, and cleaning frequency. Dust leakage, filtration efficiencies, and pressure drops were determined. The study led to the conclusion that the behavior of the various filter media investigated was predictable, but the ability to comply with emission requirements was greatly dependent on operating parameters. Limited correlation with full scale field results indicates the laboratory results to be valid and to have predictive value for field operations. 19 figures.

15313 (EPRI-CS—4918-Vol.3, pp 17.1-17.16) **Design of repairs to upgrade 10-year-old industrial precipitators.** Kunzweiler, V.L.; Landwehr, J.B. (Burns & McDonnell Engineering Co., Kansas City, MO). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

This paper discusses the design of precipitator repairs and upgrade for the two 1976 model industrial size precipitators on two 236,000 lb/hr, 450 psig pulverized coal boilers. Prior to their inspection and design of repairs, both units were seriously derated due to noncompliance with emission regulations. Problems encountered as well as specific parts failures are discussed. Some of the specific problems that are examined include the failure of rapper rods, rapper assemblies, wires and wire weights, insulators, and insulator housings. 6 figures.

15314 **(PB—87-113239/XAB) Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln.** (KVB, Inc., Irvine, CA (USA)). Oct 1986. 793p. NTIS, PC PC E99.

15315 **(PB—87-113247/XAB) Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln. Volume 1. Technical report. Final report, June 1983-September 1985.** Benson, R.C.; Hunter, S.C. (KVB, Inc., Irvine, CA (USA)). Oct 1986. 395p. NTIS, PC A17/MF A01.

Also available in set of 3 reports PC E99, PB87-113239.

The report gives results of tests to evaluate combustion modifications for nitric oxide (NO) reduction and cement-product quality in a pilot-scale long-dry-process cement kiln firing pulverized coal. The kiln is rated at 11.35 kg/s (1080 tons/day) of cement with a thermal input rate of 70.3 MW (240 million Btu/hr). Of the combustion modifications evaluated in previous studies, vitiation of the primary air with inert gas (nitrogen) was considered the best alternative for NO reduction on a pilot-scale kiln. The percent reduction was established from a reference baseline of 1050 ppm (corrected to 3% O_2) and a kiln exit oxygen of 1.82%. The NO volu-

metric emissions were lowered to 880 ppm (corrected to 3% O_2) with a kiln exit oxygen of 0.7%. NOx reductions during the short-term nitrogen injection tests were about 25-30% with no adverse effects on product quality. Because of the interacting feed chemistry/kiln operations, it was not possible to clearly isolate the effect of nitrogen injection.

15316 (PB—87-113254/XAB) Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln. Volume 2. Data supplement A. Final report, June 1983-September 1985. Benson, R.C.; Frohoff, R.A.; Parker, N.R. (KVB, Inc., Irvine, CA (USA)). Oct 1986. 134p. NTIS, PC A07/MF A01.

15318 (CRIEPI—285076) Plume washout and wet deposition of trace elements around the coal-fired power plant. Fujita, S. (Central Research Inst. of Electric Power Industry, Komae, Tokyo (Japan). Energy and Environment Lab.). 1986. vp. (In Japanese). NTIS.

Ground-based and airborne measurements of trace elements in precipitation and atmosphere were carried out around the coal-fired power plant of 1000 MW unit in the period of October 1983. The effect of plume washout and wet deposition of trace elements around the power plant was discussed on the basis of the data obtained. Concentration of trace elements with large diameter decreased with time when cyclone and front passed over the observational region. The scavenging coefficient of trace elements were ranged from 10^{-5} to $10^{-3}s^{-1}$ for rainfall rate of 3 to 4 mmh^{-1}. About half of the weight concentration of trace elements in plumes from coal-fired power plant are coarse particles and these materials may be scavenged out rapidly near the source in the case of rainy condition. The comparison between calculated value based on atmospheric diffusion model and ground-based observational value suggests that the contribution of plume washout is relatively small at the downwind distance of 10 km from the plant.

15319 (TNO-HMT-R—83/159A) On the mutagenicity of fly ash samples from the PGEM power plant 'Gelderland' at Nijmegen, as determined with the Ames test. Davis, P.B. (Hoofdgroep Maatschappelijke Technologie TNO, Apeldoorn (Netherlands)). 29 Jun 1985. 65p. (In Dutch). NTIS (US Sales Only), PC A04/MF A01. File Number DE87751294.

In March 1981 and January 1982, the stack ash and filter ash from the coal fired units at the PGEM power plant 'Gelderland' in Nijmegen were investigated in the Ames test, a test for the induction of mutations in special strains of the bacterium Salmonella typhimurium. Organic extracts of stack-ash were clearly mutagenic in the Ames test. The greatest effect (up to 180 revertants/mg stack-ash) was found in strain TA98, whilst no effect was found in strain TA1535. These results indicate that the effects produced can be ascribed, to a great extent, to 'frame-shift' mutations. The mutagenicity of the stack-ash extracts generally decreased in the presence of rat liver homogenate (system for metabolic activation). The mutagenicity disappeared if the stack-ash was heated to 400 C prior to preparation of the extract. This indicates that the mutagenicity is probably almost entirely due to the presence of organic compounds in the stack-ash. Experiments with nitroreductase-deficient strains inducted that a large part of the mutagenicity can be ascribed to nitro-compounds. Due to problems with the sampler used in January 1982, the mutagenicity of many of the stack-ash samples collected at that time could not be determined. Reaction between the hot stack gases and the bagfilter material used in the sampler resulted in contamination of the samples with toxic substances which masked the presence of mutagenic compounds, if present. Organic extracts of filter-ash were not mutagenic; extracts of ash from the final zone of the filter were generally not, or hardly, mutagenic.

15320 (CSIRO-DG-GCM—63) Numerical modelling of development roadways, German Creek Central Colliery, Central Queensland. McNabb, K.E.; Wardle, L.J. (Commonwealth Scientific and Industrial Research Organization, Mount Waverley (Australia). Div. of Geomechanics). 1986. 29p. NTIS.

This report presents an analysis of the stability of the main development roadways at German Creek Central Colliery, Queensland. Roadway stability is studied using a numerical model that realistically incorporates the characteristic geological features of the German Creek Main coal seam, i.e., in pervasive shear zone at seam mid-height and clay bands close to the top and bottom of the seam. Model predictions show that the properties of the clay bands can strongly influence the size of the yield zone in the roadway ribsides.

15321 (CSIRO-DG-GCM—64) System for automatic monitoring of longwall supports at Angus Place colliery. Dean, A.; Bride, J. (Commonwealth Scientific and Industrial Research Organization, Mount Waverley (Australia). Div. of Geomechanics). 1986. 15p. NTIS.

An intrinsically safe automatic data logging system was developed at the Division of Geomechanics and installed at the Angus Place colliery in the Western Coalfields of NSW, to monitor the hydraulic pressure in powered supports during longwall mining. The report describes the basic features of the system and its components, and indicates the logistical requirements for installation and operation, as exemplified at the Angus Place colliery.

15322 (PB—87-113171/XAB) Surface and underground coal-mine-equipment population, 1982. Information Circular/1986. Pojar, M.G. (Bureau of Mines, Twin Cities, MN (USA). Twin Cities Research Center). 1986. 32p. (BM-IC—9078). NTIS, PC A03/MF A01.

Library of Congress catalog card no. 86-600035.

The Bureau of Mines report estimates the population of the principal types of machinery in use by the coal-mining industry during 1982 in surface and underground mines. Estimates were arrived at using 1976 coal-equipment population estimates as baseline data with modifications made for new mine development, expansion, and closure occurring during 1976-82. Estimates were broken down into 3 regions that included all 26 coal-producing states. The mine models used to generate equipment information are included in the report, along with the hypothesized equipment use data. The equations and various factors used to determine the equipment adjustments for mine closings, new mine openings, and small-coal-mine operations are also identified.

15323 **(CONF-860961—5) Advanced research in instrumentation and control technology: Multiphase flow studies.** Doss, E.D.; Srinivasan, M.G.; Raptis, A.C. (Argonne National Lab., IL (USA)). Aug 1986. Contract W-31-109-ENG-38. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004661.

From Instrumentation, components and materials contractors' meeting; Morgantown, WV, USA (16 Sep 1986).

The objective of these studies is to develop analytical models of the physical phenomena involved in the flow of solid/gas mixtures in ducts, and to verify the developed models through experiments in the Argonne National Laboratory's Solid/Gas Flow Test Facility (SGFTF). Analytical models thus verified would be used for developing nonintrusive flow instruments. Several analytical models have been developed that involve a one-dimensional model of pipe flow with suspensions. The models vary in their complexity and assumptions. 8 refs., 3 figs., 1 tab.

15324 **(DOE/PC/80524—T6) Pipe and bend erosion by pneumatic transport of solids at high temperature: Quarterly report, September-November 1986.** Klinzing, G.E. (Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering). 1986. Contract FG22-85PC80524. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005039.

The last two experiments scheduled for the erosion of ceramic straight pipes were completed during this quarter. The preliminary results accounting for the effect of gas velocity, solids flow rate and temperature on the erosion rates are presented and discussed. 5 figs., 3 tabs.

15325 **(PB—87-113197/XAB) Establishment of data bank on the self-heating of coal. Final report.** Riley, J.T.; Reasoner, J.W.; Holy, N.L.; Fatemi, S.M.; Yates, G.S. (Western Kentucky Univ., Bowling Green (USA)). Jul 1986. 119p. NTIS, PC A06/MF A01.

A data bank containing analytical data and barging information on 2283 barges of coal was established. A major portion of the barges contained coal transported from coal fields in Kentucky, Illinois, Indiana, and Ohio to river ports in the New Orleans area where it was loaded onto ships and exported. Extensive analytical data, coal temperature measurements, and meteorological data were collected for many of the barges. Separate barging experiments to examine the effect of various coal loading and compacting methods on self-heating as well as air flow patterns through the coal in barges were conducted. The effect of using carbon dioxide to exclude air from the bottom of barges as a means of reducing the degree of self-heating in coal was studied. Laboratory tests to measure the relative susceptibility of coals to undergo self-heating were studied.

15326 **(CONF-861251—2) Computer simulation of pulverized coal combustion in various CO_2/O_2 atmospheres and in air.** Berry, G.F.; Wang, C.S.; Chang, K.C.; Wolsky, A.M. (Argonne National Lab., IL (USA)). Dec 1986. Contract W-31109-ENG-38. 8p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004825.

From American Society of Mechanical Engineers winter annual meeting; New York, NY, USA (8 Dec 1986).

In this study, we used a one-dimensional coal combustion or gasification (1-DICOG) computer code to simulate differences in the combustion performance of pulverized coal when various CO_2/O_2 mixtures were substituted for air in the combustion process. Four test cases were analyzed, and results predicted by the model were compared with the corresponding results of actual combustion experiments. Comparisons of predicted and measured data for all test cases show the the observed trends of distributions of temperature and of species concentrations are predictable; discrepancies between predictions and measurements of these data are primarily attributed to limitations of the 1-DICOG computer code. We find that the combustion processes of pulverized coal can be completed in an atmosphere of CO_2 and O_2 over a range of CO_2-to-O_2 mole ratios between 2.23:1 and 3.65:1 - and that the combustion performance of coal burned in a CO_2/O_2 atmosphere with a 2.42:1 mole ratio closely resembles that of coal burned in air. 8 refs., 10 figs., 2 tabs.

15327 **(DOE/FE—0078) Comprehensive report to Congress: Clean Coal Technology program: Tidd PFBC [pressurized fluidized-bed combustion] demonstration project.** (USDOE Assistant Secretary for Fossil Energy, Washington, DC). Feb 1987. 32p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005803.

One technology with high potential for meeting the end-of-century requirements for large power generation applications is combined-cycle pressurized fluidized bed combustion (PFBC). PFBC permits the combustion of a wide range of coals, including high sulfur coals, with a sorbent, such as limestone or dolomite, in a fluidized bed combustor at an elevated pressure. The sorbent captures most of the sulfur emissions during the combustion process itself which greatly reduces or completely eliminates the need for expensive downstream sulfur control equipment. PFBC produces a dry solid sorbent waste which is easily disposed of in an environmentally acceptable manner. In addition, the lower operating temperature substantially reduces nitrogen oxide emissions. In addition to these environmental features, PFBC components and plant facilities are considerably smaller than nonpressurized or conventional units of equal generating capacity. To further the development of PFBC, the Department of Energy and Ohio Power Company (OPCo), a wholly owned subsidiary of American Electric Power Company, Inc. (AEP), have negotiated a Cooperative Agreement to construct and operate a 70 megawatt (MWe) PFBC combined-cycle demonstration plant. The work to be performed under the Cooperative Agreement covers the design, construction, and operation of the demonstration plant. The overall objective of this project is to demonstrate PFBC technology at a large scale for use in commercial electric generating plants. The specific goal of this project is to demonstrate that combined-cycle PFBC technology is a cost-effective, reliable, and environmentally superior alternative to conventional coal fired electric power generation with flue gas desulfurization.

15328 **(DOE/PC/90751—T1) Transformations of inorganic coal constituents in combustion systems: Quarterly report No. 1 for the period October-December 1986.** Boni, A.A.; Srinivasachar, S.; Simons, G.A. (Physical Sciences, Inc., Andover, MA (USA)). 30 Jan 1987. Contract AC22-86PC90751. 35p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005018.

This project consists of an integrated series of experimental and modeling tasks performed by Physical Sciences Inc. (PSI) and five subcontractors to achieve the project objectives. Important ele-

ments of this work include coal characterization using advanced analytical techniques, testing in small-scale reactors and combustors, modeling of fundamental processes by which mineral transformations occur, as well as incorporating an improved understanding of these processes into an engineering model to predict particulate size and composition distributions. The project consists of the following tasks: (1) program planning, management, reporting, and peer review; (2) coal selection preparation and characterization; (3) advanced techniques for coal mineral characterization; (4) fundamental studies of selected ash vaporization, nucleation, condensation, and coagulation phenomena; (5) fundamental studies of mineral matter vaporization and residual ash formation; (6) pulverized coal combustion studies of ash enrichment by volatiles and fragmentation; (7) idealized combustion determination of ash particle formation and surface stickiness; and (8) model development and integration. During this reporting period primary work performed was of an organizational and planning nature. PSI initiated work on Tasks 7 and 8 by: carrying out a conceptual design of the swirl stabilized reactor; and developing a methodology to incorporate the presence of mineral matter and char fragmentation into existing char combustion models. 11 refs., 7 figs., 2 tabs.

15329 (NP—7751262) **Experimental investigation of the formation of nitrogen oxides in combustion of coal dust. 2nd intermediate report covering the period from May 1, 1983 to June 30, 1984.** Kremer, H.; Schulz, W. (Bochum Univ. (Germany, F.R.). Lehrstuhl fuer Energieanlagentechnik). Jun 1984. 100p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE87751262.

In order to obtain more knowledge on the mechanism and the kinetics of the formation of NO from the nitrogen in the coal, and on the behaviour of the residual coke together with the components of the stack gas, experiments were carried out in an electrically heated step combustion chamber. The formation of nitrogen oxides in combustion of coal dust is explained in detail, with data on thermal and 'prompt' NO and on NO as gaseous nitrogen and from nitrogen in the residual coke. There is a report on burners and firing low in NO/sub x/ and on experimental plant (heating, air preheater, coal dosing, post-combustion and dust extraction, air supply) and the measuring technique used. Results of investigations on the effect of stoichiometry, wall temperature, dwell time and type of coal on the formation of nitrogen oxide are given for single stage combustion and multistage combustion. A system of equations was set up to describe the NO concentration. (HWJ).

15330 (PNL—5500-Pt.4, pp 3-4) **Analysis of coal and coal liquid combustion products.** Chess, E.K.; Wilson, B.W.; Later, D.W. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

The authors have undertaken an analysis of the products of the open air combustion of petroleum- and coal-derived liquid fuels. Initial results indicate that much of the material extracted from the combustion particulate is chemically unaltered relative to that in the initial fuel. Hence, compounds such as amino-polycyclic aromatic hydrocarbons (APAH), as well as certain carcinogenic PAH, appear to simply volatilize and then recondense on carbon-based particulates formed during combustion. The failure of open flames to effect more complete combustion leads to marked differences in the chemical constituency of those petroleum-derived fuels tested as compared to the coal liquids. The coal-derived particulate extracts were slightly more mutagenic in their nitrogen-rich fractions than were the petroleum-derived extracts. These differences appear to be substantially greater than the differences noted for these two types of materials in recent utility combustion tests.

15331 **Experimental and theoretical studies of reverse combustion in porous media.** Visser, W.; Krantz, W.B.; Britten, J.A. (Univ. of Colorado, Boulder, CO). pp 215 of Proceedings of the twenty-first symposium (international) on combustion. Pittsburgh, PA; Combustion Institute (1986). (CONF-860804—).

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

This paper describes recent experimental and modeling studies of reverse combustion (RC) in consolidated combustible porous media, aimed at the understanding of RC dynamics and channeling behavior in situ coal seams and tar sand deposits.

15332 **Single-particle combustion of Beulah lignite char.** Young, B.C.; McCollor, D.P.; Weber, B.J.; Jones, M.L. (Univ. of North Dakota Energy Research Center, Box 8213, University Station, Grand Forks, ND 58202). pp 266 of Proceedings of the twenty-first symposium (international) on combustion. Pittsburgh, PA; Combustion Institute (1986). (CONF-860804—).

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

A fundamental study of the combustion behavior of U.S. lignite and subbituminous coal chars was recently initiated at the University of North Dakota Energy Research Center. To accomplish this task a single-particle reactor has been developed in which individual coal char particles are burned in a controlled flameless environment and monitored by non-intrusive techniques.

15333 **A comparison of the evolution of particle size distributions during combustion for coal and coal/water slurries.** Dunn-Rankin, D.; Hoornstra, J.; Fletcher, T.H.; Holve, D.J. (Combustion Research Facility, Sandia National Lab., Livermore, CA 94550). pp 160 of Proceedings of the twenty-first symposium (international) on combustion. Pittsburgh, PA; Combustion Institute (1986). (CONF-860804—).

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

The use of coal/water slurries in heat engines, such as medium speed diesels and turbines, is limited by the relatively long residence time requirements for efficient combustion, and by the fouling and pollutant emission caused by mineral matter in the coal. One of the keys to solving these problems is the control of particle size. The understanding of the evolution of the particle size distribution (PSD) during PC and CWS combustion, and the relation of this evolution to the rank of the coal fuel, is the thrust of this work.

15334 **Predicting devolatilization at typical coal combustion conditions with the distributed-energy chain model.** Niksa, S.; Kerstein, A.R.; Fletcher, T.H. (Mechanical Engineering Dept., Stanford Univ., Stanford, CA 94305). pp 159 of Proceedings of the twenty-first symposium (international) on combustion. Pittsburgh, PA; Combustion Institute (1986). (CONF-860804—).

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

Hypothetical ultimate yields for rapid coal devolatilization arose from the historical notions that a well-defined amount of volatile precursors are present in coal, and that their rate of release is directly proportional to a decaying reactant concentration. However, recent analyses of coal structure suggest a far less direct relationship between the reactive species in coal and the pyrolysis products. According to the aromatic/hydroaromatic model, bituminous coals are composed of aromatic "nuclei" interconnected by various bridges and substituted with smaller functional groups on their periphery. Bituminous coal is a crosslinked macromolecular network.

15335 (CONF-8606161—, pp 17-20) **Metabolism of polycyclic aromatic hydrocarbons in coal-derived complex mixtures applied to mouse skin.** Dankovic, D.A.; Wright, C.W.; Springer, D.L. (Battelle Pacific Northwest Lab., Richland, WA). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

Coal-derived complex mixtures (CDCMs) are carcinogenic in mouse skin-painting experiments, with most of the tumor-initiating activity residing in the neutral polycyclic aromatic hydrocarbon (PAH) fraction of the materials boiling above 750°F. The 800-850°F and > 850°F distillates derived from the solvent-refined coal process contain essentially identical concentrations (approximately 1700 ppm) of benzo[a]pyrene (BaP), but differ substantially in tumor-initiating activity. The present study had three goals: to determine the persistence of BaP at the site of application on mouse skin, in the presence and absence of CDCMs; to determine the chemical form of the BaP at the site of application; and to determine the time course of disappearance from the site of application of selected PAH's in the PAH fraction derived from the 800-850°F CDCM. The effects of the 800-850°F and > 850°F materials on the rate of disappearance of BaP from mouse skin was determined by selective extraction of parent PAHs after co-administration of these materials with radiolabelled BaP. The chemical form of the ^{14}C-labelled BaP was determined by reverse-phase HPLC, and the PAHs remaining at the application site were identified and quantified by high-resolution capillary-column gas chromatography.

15336 (CONF-8606161—, pp 25-28) **Complex mixtures: comparative chemical and toxicological characterization.** Stamoudis, V.C.; Picel, K.C.; Haugen, D.A. (Argonne National Lab., IL). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821. Contract W-31-109-ENG-38.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

Fossil-energy-related complex organic mixtures such as petroleum, shale oil, and coal-conversion products and by-products, have some distinct similarities in composition, as well as some notable differences. The toxicity of such mixtures, as measured by microbial mutagenicity, tends to be low for those of geochemical origin, such as petroleum, and relatively high for coal-conversion products and by-products. Chemical and toxicological data were obtained for three energy-related materials, a by-product oil from the Great Plains commercial gasifier (GPCG); a comparative research material, CRM-1, from the SRC-II coal-liquefaction process; and a shale oil standard reference material (SRM #1580) from the National Bureau of Standards. The materials are compared on the basis of mass and mutagenicity balances for major chemical fractions produced from standardized fractionation procedures. Microbial mutagenicity assays were performed using Salmonella strain TA98 with rat liver S9 metabolic activation.

15337 (CONF-8606161—, pp 41-43) **Developmental effects in rats and mice after dermal exposure to a high-boiling complex organic mixture.** Mahlum, D.D.; Zangar, R.C.; Springer, D.L. (Pacific Northwest Lab., Richland, WA). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821. Contract AC06-76RL01830.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

For this study pregnant Sprague-Dawley rats and CD-1 mice were treated dermally at doses of 500 to 1500 mg/kg body weight on 11-15 days of gestation with SRC-II heavy distillate. The rats were killed on dg 20 and the mice on dg 18. The uterus was removed and the fetuses were weighed and examined for gross, visceral, and skeletal abnormalities. Results from this study demonstrate considerable similarity between rats and mice with regard to prenatal effects resulting from dermal exposure to a high-boiling complex organic mixture. For both species, growth retardation and cleft palates were observed; however, small lungs were observed only in rats. This species difference may indicate that: (1) constituents responsible for cleft palate are different from those inducing small lungs (2) there are differences in the metabolite profiles between the two species (3) lung development in the rat is more sensitive than in mice to constituents or metabolites from the mixture, or that (4) there are other more generalized metabolic differences between the two species.

15338 (CONF-8606161—, pp 45-47) **Effects of complex organic mixtures of coal liquid on cardiovascular function.** Springer, D.L.; Sasser, L.B.; Zangar, R.C.; Mahlum, D.D. (Battelle Pacific Northwest Lab., Richland, WA). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

The most common diseases in the US are those involving the cardiovascular system. Exposure to certain environmental chemicals and complex mixtures may be involved in some aspects of cardiovascular disease. They have previously reported that high-boiling coal liquids resulted in several affects related to the cardiovascular system of the rate when exposed via whole-body inhalation to the mixture. The most striking observation was a dose dependent elevation in arterial blood pressure for heavy distillate (HD) exposed rates compared to control animals at 2 weeks. They also noted an increase in heart rate and plasma and blood volume. Additional rats were evaluated 6 weeks after exposure, to determine whether these effects represented permanent changes in cardiovascular function, and the effects appeared to be reversible after this longer period. During the past year they have completed the assays of the studies initiated previously and have addressed some possible factors which could explain the effects that they observed. Electrolytes in plasma of rats exposed to the HD were analyzed by inductively coupled plasma-atomic emission spectroscopy (ICP-AES). Plasma aldosterone and angiotensin were measured by radioimmunoassays, and plasma cholesterol, triglycerides, and high-density lipoprotein were evaluated with an Abbott VP bichromatic chemistry analyzer. In addition, a comparison of the blood pressure of control rats and rats fed a restricted diet were made, to determine if the anorexia which resulted from HD exposure could be responsible for the changes they observed in cardiovascular function.

15339 (CONF-8606161—, pp 57-59) **Lifetime studies with mice after exposure to a high-boiling complex organic mixture.** Springer, D.L.; Miller, R.A.; Mahlum, D.D. (Pacific Northwest Lab., Richland, WA). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

Previously they reported on a subchronic study in which CD-1 mice were exposed by inhalation to solvent refined coal (SRC)-II heavy distillate. Results indicated that there were dose related increases in liver weights and decreases in thymus weights for middle and high exposure group animals. In addition, decreases were observed in the number of red blood cells, volume of packed red cells and hemoglobin concentration for high-dose animals. Microscopic examination of organ sections showed focal hepatic necrosis, nonspecific hepatopathy and degeneration of olfactory epithelium. Comparison of these effects with those for rats similarly exposed indicated that fewer lesions were present in mice, and that lesions were observed in rats at lower doses than those required to produce effects in mice. In addition to animals for the subchronic study, mice were exposed to similar aerosol concentrations for either 1, 4 or 12 weeks. Statistical evaluation data indicated significant decreases in the survival curves and in body-weight curves for exposed mice. Results for light microscopic examination of these tissues indicated that a significant number of mice exposed to the high and middle doses for 4 and 12 weeks developed alveolar epithelial hyperplasia, alveolar/bronchiolar adenomas and carcinomas. In addition, a significant number of high-dose animals from the 4- and 12-week exposure groups developed skin tumors. In addition, they also observed noncarcinogenic changes in the nasal cavity.

15340 (CONF-8606161—, pp 61-65) **Compilation of toxicological, chemical and engineering data on coal conversion process materials: status and summary of results.** Gray, R.H.; Drucker, H.; Massey, M.J.; Craun, J.C.; Fillo, J.P.; Hubis, W.; Reilly, C.A.; Renne, R.A.; Wilson, B.W.; Later, D.W.; Haugen, D.A. (Pacific Northwest Lab., Richland, WA). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

Over the last decade, a substantial data base has been developed concerning the physical, chemical and toxicological properties of coal conversion (liquefaction and gasification) materials. This study evaluated products and byproducts obtained from processes that, in many cases, were operated under a variety of conditions and configurations. Toxicological research on coal-derived materials was performed using a tiered approach. Initially, materials were

screened using a battery of short-term bioassays. Chemical fractionation and detailed chemical analyses were performed on those materials showing toxicological activity to identify the bioactive components. Some materials were subjected to whole-animal studies to evaluate potential carcinogenicity, teratogenicity and/or other toxic effects. Again, chemical fractionation and detailed chemical analyses were used to identify components of those materials that were of greatest concern. This has been termed the biodirected approach. They recently completed a major effort to compile, integrate and evaluate the chemical, physical, toxicological and engineering data base that was developed. This paper summarizes the results of this effort and indicates those properties/characteristics of coal conversion materials that most directly relate to toxicological effects. 8 references, 2 figures.

15341 (CONF-8606161—, pp 81-84) **Initiation-promotion studies with complex mixtures.** Mahlum, D.D. (Battelle Pacific Northwest Lab., Richland, WA). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

The authors have tested coal-derived distillates with boiling ranges for their effect on BaP initiating activity to determine if higher boiling materials are more effective inhibitors of benzo[a]pyrene (BaP) initiating activity than are the lower boiling distillates. Twenty-five μg of BaP was applied to the backs of female mice in the presence of 5 mg of coal liquid distillates. The distillate boiling from 300-700° had no effect on BaP expression. However, the 700-750°, 750-800° and the 800-850°F distillates all inhibited BaP expression. The results with the > 850° distillate are not easily interpreted since the distillate itself had substantial activity. They have attempted to determine if the inhibition activity resides with a particular chemical class. They therefore fractionated the 750-800°F distillate into aliphatic, neutral polycyclic aromatic hydrocarbon (PAH), nitrogen-containing polycyclic aromatic compound (NPAC), and hydroxy-PAH (HPAH) fractions. Results indicate that the PAH and NPAC fractions as well as the parent distillate significantly inhibited BaP expression. Studies evaluating the tumorigenic activity of coal-derived distillates using initiation-promotion and chronic skin assays in the mouse have demonstrated that activity increases with increased boiling range. Results from the two assays suggest that distillates boiling from 700-750° and 750-800°F may be relatively more active in the chronic skin painting assay than in the initiation-promotion assay. They speculated that this may be due to a greater number of cells being initiated by the repeated application of test material used in the chronic painting protocol. In all cases, the animals initiated with multiple doses had a higher response than did those that received one dose even though the total amount of test material was the same.

15342 (CONF-8606161—, pp 85-87) **Tumor-promoting activity of complex organic mixtures.** Haugen, D.A.; Peraino, C. (Argonne National Lab., IL). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821. Contract W-31-109-ENG-38.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

To test the tumor-promoting activity of complex organic mixtures, they are using a hepatic initiation-promotion model in which newborn rats are treated once with a sub-hepatotoxic amount of tumor-initiator followed after weaning by treatment with a putative promoter. At 11-12 weeks of age, the rates are sacrificed and the livers are analyzed histochemically for foci of altered cells, indicated by the presence of gamma-glutamyl transpeptidase (GGT). They found earlier that, as for dietary treatment with phenobarbital, twice-weekly topical treatment with either a complex coal liquid heavy distillate or a coal gasifier tar of similar compositions enhanced the appearance of GGT-positive foci for rats treated at birth with either of the tumor promoters diethylnitrosamine (DEN) or benzo[a]pyrene. Topical treatment of the rats did not cause dermal tumorigenesis and did not cause the appearance of hepatic foci in animals that were not treated with initiator at birth. The results demonstrated that (a) promotion of tumorigenesis in internal organs can be a consequence of dermal exposure to energy-related complex mixtures, (b) the rat liver hepatocarcinogenesis model allows detection of tumor-promoting activity in mixtures that also contain tumor-initiating activity, and (c) that there may be as yet unidentified tumor promoters in energy-related complex mixtures. They are conducting a further study to determine whether topical treatment with a coal liquid heavy distillate of rats treated with DEN at birth produces hepatic tumors by 180-200 days, as well as preneoplastic foci by 70-80 days.

15343 (CONF-8606161—, pp 115-120) **Effects of highly aromatic complex chemical mixtures on the mutagenicity of amino-PAH, nitro-PAH and the intercalating agent, ICR191.** Pelroy, R.A.; Stewart, D.L. (Pacific Northwest Lab., Richland, WA). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

Previous work suggested that mixtures of 6-aminochrysene (6-AC) and complex chemical mixtures for high-boiling coal liquids (CL) were more mutagenic than 67-AC alone, or the complex mixtures alone. The work presented here extends this observation to other amino-polycyclic aromatic hydrocarbons (amino-PAH) and also to mutagens (or premutagens) differing from the amino-PAH in their requirements for metabolic activation. In particular, results are presented for nitro-polycyclic aromatic hydrocarbons (nitro-PAH) and for the heterocyclic intercalating agent, ICR191, a direct-acting mutagen requiring no metabolic activation. 6 tables.

15344 **(CRIEPI—484007) Response of small laboratory animals to coal fly ash inhalation.** Kamihira, M. (Central Research Inst. of Electric Power Industry, Abiko, Chiba (Japan)). 1986. vp. (In Japanese). NTIS.

Properties of lung surfactant of golden hamsters exposed to fly ash, 5 mg/m, for 10 hours/day 7 days/week for 3 weeks were examined. Exposed group showed lower maximum value of surface tension than sham-exposed group, and minimum value in exposed group was higher than in sham-exposed group. So stability index (S.I.) obtained from the surface tension of lung extracts in exposed group was lower than in sham-exposed group; the difference between the 2 S.I. values was small but statistically significant. In addition, the bubble stability ratio (S.R.) in exposed group tended to be lower than in sham-exposed group.

15345 **Monitoring exposure to polynuclear aromatic compounds via room temperature phosphorescence from solid substrates.** Vo-Dinh, T.; Gammage, R.B. (Oak Ridge National Lab., TN). *Radiation Protection Dosimetry;* 6: No. 1-4, 137-140([1987]). Contract W-7405-ENG-26.

Room Temperature Phosphorescence (RTP) Spectroscopy is a relatively new solid state luminescence technique for monitoring polynuclear aromatic (PNA) compounds. The RTP technique can detect a variety of PNA pollutants at subnanogram levels. Practical applications include rapid and cost-effective screening of PNA species in complex samples and direct reading detection of airborne PNA compounds collected on a new type of personnel vapor dosemeter. 10 references, 3 figures.

15346 **Regulation of surface subsidence in West Virginia.** Meador, S. pp 6-8 of Proceedings, 2nd workshop on surface subsidence due to underground mining. Peng, S.S. (ed.). Morgantown, WV; West Virginia University (1986). (CONF-8606249—).

From 2. workshop on surface subsidence due to underground mining; Morgantown, WV, USA (9 Jun 1986).

This paper concerns the regulation of coal mining in West Virginia which is similar to the Federal Surface Mining Control and Reclamation Act as well as other states' statutes. However certain legal and administrative issues combine to make West Virginia's regulation of surface subsidence a singular approach. The evolution of subsidence regulations, administrative issues and legal issues are discussed. 3 references.

15347 **Low radioactivity spectral gamma calibration facility.** Mathews, M.A.; Bowman, H.R.; Huang, L.; Lavelle, M.J.; Smith, A.R.; Hearst, J.R.; Wollenberg, H.A.; Flexser, S. (Los Alamos National Lab., Los Alamos, NM). pp 15 of Proceedings of the twenty-seventh annual logging symposium. Houston, TX; Society of Professional Well Log Analysts Inc. (1986). (CONF-8606105—).

From 27. annual logging symposium of the Society of Professional Well Log Analysts; Houston, TX, USA (9 Jun 1986).

A low radioactivity calibration facility has been constructed at the Nevada Test Site (NTS). This facility has four calibration models of natural stone that are 3 ft in diameter and 6 ft long, with a 12 in. cored borehole in the center of each model and a lead-shielded run pipe below each model. These models have been analyzed by laboratory natural gamma ray spectroscopy (NGRS) and neutron activation analysis (NAA) for their K, U, and Th content. Also, 42 other elements were analyzed in the NAA. The /sup 222/Rn emanation data were collected. Calibrating the spectral gamma tool in this low radioactivity calibration facility allows the spectral gamma log to accurately aid in the recognition and mapping of subsurface stratigraphic units and alteration features associated with unusual concentrations of these radioactive elements, such as clay-rich zones.

15348 **Calculation of gravimetric density caused by three-dimensional structure.** Hearst, J.R.; Carlson, R.E.; Clark, S.R. (Lawrence Livermore National Lab., Livermore, CA). pp 22 of Proceedings of the twenty-seventh annual logging symposium. Houston, TX; Society of Professional Well Log Analysts Inc. (1986). (CONF-8606105—). Contract W-7405-ENG-48.

From 27. annual logging symposium of the Society of Professional Well Log Analysts; Houston, TX, USA (9 Jun 1986).

For many years the authors have been comparing measured and calculated gravimetric density from a gamma-gamma density log to infer subsurface structure. They have used two-dimensional models, usually geologists' cross sections, to provide input for calculation of corrected gravimetric density for comparison with measured gamma-gamma density. Often the real structures could be better described in three dimensions. The difficulty with calculating the gravitational effect of three-dimensional structure is not in the calculation itself, but in the description of the structure such that it fills all space and does not contain voids. They solve this problem by using contour maps of subsurface boundaries between media of different density. The contour lines are digitized, and the digitized data are used to construct a function that is then evaluated over a fine grid surrounding the bore-hole. The algorithm used to construct the approximating function is a modification of Hardy's multiquadric method for interpolating scattered data. The edges of the grid are smoothed, and then extended to distances great enough to be effectively infinite in the gravity calculation. The gravity calculation uses an algorithm by Banerjee and Gupta for the calculation of the gravitational effect of a right rectangular prism.

15349 **Evaluation and design of a large spacing loop-loop electromagnetic tool.** Harben, P.E.; Rodgers, P.W.; Holladay, G. (Lawrence Livermore National Lab., P.O. Box 5504, L-156, Livermore, CA 94550). pp 21 of Proceedings of the twenty-seventh annual logging symposium. Houston, TX; Society of Professional Well Log Analysts Inc. (1986). (CONF-8606105—).

From 27. annual logging symposium of the Society of Professional Well Log Analysts; Houston, TX, USA (9 Jun 1986).

This paper investigates the potential use of a large spacing loop-loop electromagnetic logging tool to detect resistivity anomalies as far as 25 meters away from the borehole wall. A three-dimensional whole space electromagnetic modelling code was used to evaluate the responses of such a tool to various transmitter and receiver loop orientations, operating frequencies, loop spacings, resistivity contrasts, anomaly sizes and anomaly distances. Anomalies were modeled as finite extent sheets of various thicknesses which terminated before intersecting the borehole wall. It was found that both coplanar and coaxial loop orientations provide strong anomaly responses, but the coaxial loop orientation has superior depth penetration and is a less complex tool to design and build. For such a coaxial tool, anomalies could be detected as far from the borehole wall as half the loop spacing. For rock resistivities on the order of 100 ohm-m, contrasts greater than 2:1 and loop spacings of 75 meters the optimal operating frequency is shown to be 10 kHz. At these loop spacings, anomalies must be thicker than 10 meters to be detected. It is further shown that for coaxial loops the nature of the response curves allows one to estimate the distance of an anomaly from the borehole wall although no angular location is possible.

15350 **Geochemistry of Ca, Sr, Ba and Ra sulfates in some deep brines from the Palo Duro basin, Texas.** Langmuir, D.; Melchior, D. (Colorado School of Mines, Golden). *Geochimica et Cosmochimica Acta;* 49: No. 11, 2423-2432(Nov 1985).

The geochemistry of Ca, Sr, Ba and Ra sulfates in some deep brines from the Palo Duro Basin of north Texas, was studied to define geochemical controls on radionuclides such as ^{90}Sr and ^{226}Ra. Published solubility data for gypsum, anhydrite, celestite, barite and $RaSO_4$ were first reevaluated, in most cases using the ion interaction approach of Pitzer, to determine solubility products of the sulfates as a function of temperature and pressure. Ionic strengths of the brines were from 2.9 to 4.8 m, their temperatures and pressures up to 40°C and 130 bars. Saturation indices of the sulfates were computed with the ion-interaction approach in one brine from the arkosic granite wash facies and four from the carbonate Wolfcamp Formation. All five brines are saturated with respect to gypsum, anhydrite and celestite, and three of the five with respect to barite. All are undersaturated by from 5 to 6 orders of magnitude with respect to pure $RaSO_4$. ^{226}Ra concentrations in the brines, which ranged from 10/sup -11.3/ to 10/sup -12.7/ m, are not controlled by $RaSO_4$ solubility or adsorption, but possibly by the solubility of trace Ra solid solutions in sulfates including celestite and barite.

15351 **Cenozoic fluctuations in biotic parts of the global carbon cycle.** Olson, J.S. (Environmental Sciences Div., Oak Ridge National Lab., Oak Ridge, TN 37831). pp 377-396 of The carbon cycle and atmospheric CO/sub 2/: Natural variations Archean to present. Sundquist, E.T.; Broecker, W.S. Washington, DC; American Geophysical Union (1985). (CONF-840181—).

From American Geophysical Union Monography meeting on carbon dioxide through geologic time; Tarpon Spring, FL, USA (15 Jan 1984).

The mass of organic carbon in land plants presumably decreased over much of Tertiary time. Global average cooling, mountain building, rain shadows, and other drying displaced forests and led to the expansion of shrublands, grasslands and deserts. Quaternary cold repeatedly stimulated the expansion of tundra and cold deserts. Lowering of sea level partly compensated with new areas for coastal and wetland vegetation. Interglacial and postglacial ice retreats opened new lands for boreal, mostly conifer forests (taiga), and for renewed storage of peat in mires. Early Holocene broad-leaved forests expanded again (along with temperate and humid tropical/subtropical climates) and constitute most of the world's plant carbon mass. Slightly less than 800 10/sup 9/ metric tons C is a plausible estimate in all live land plants in mid-Holocene time. Variations from this estimate by a factor of about 2 seem likely within the late Cenozoic Era: higher in early Miocene and lower in glacial times; 460-660 x 10/sup 9/ metric tons C from A.D. 1980 to —1780 A.D.

15352 **Simulation experiments with Late Quaternary carbon storage in mid-latitude forest communities.** Solomon, A.M.; Tharp, M.L. (Environmental Sciences Div., Oak Ridge National Lab., Oak Ridge, TN 37831). pp 235-250 of The carbon cycle and atmospheric CO/sub 2/: Natural variations Archean to present. Sundquist, E.T.; Broecker, W.S. Washington, DC; American Geophysical Union (1985). (CONF-840181—).

From American Geophysical Union Monography meeting on carbon dioxide through geologic time; Tarpon Spring, FL, USA (15 Jan 1984).

The assumption was tested that forest biomass in communities on the modern landscape is equivalent to that in similar communities on the late Quaternary landscape. Forest carbon storage dynamics during the past 16,000 years were derived from a mathematical model of forest processes and individual tree species behavior. Modern pollen and climate data sets provided pollen-climate transfer functions to generate model driving variables from fossil pollen records. Climate variables were estimated from fossil pollen stratigraphies in Tennessee, Ohio, and Michigan. Only simulated early postglacial warming produced the large carbon gains one would expect in mixed deciduous-coniferous forests from unglaciated regions. The simulated mid-Holocene warming generated little carbon storage response by temperature deciduous forests and large carbon gains in northern hardwood-conifer forests, unlike the linear relationship expected when equivalence is assumed between modern and prehistoric forests. Late-glacial, mid-latitude forests may have contained more biomass than would be expected from equivalent forests on the modern landscape. Simulations of alternate hypotheses to explain the enhanced late glacial biomass cannot distinguish effects of reduced seasonal temperature extremes from effects of changing species' temperature tolerances.

15353 **(DOE/BC—86/1) Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 45, Quarter ending December 31, 1985.** (USDOE Bartlesville Project Office, OK). Dec 1986. 119p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE86000294.

Progress reports are presented for field tests and supporting research for the following: chemical flooding; gas displacement; thermal methods; resource assessment; environmental technology; and microbial enhanced oil recovery. (AT)

15354 (DOE/BC—86/2/SP, pp 17.47-17.69) **Experimental study of waterflooding from a 2-D layered sand model.** Ahmed, G. Mar 1986. NTIS, PC A16/MF A01. File Number DE86000278.

In Second amendment and extension to Annex IV enhanced oil recovery thermal processes.

This study is a continuation of earlier work on gas-surfactant flow through a bench-scale, unconsolidated sandpack. The report outlines the latest attempts of gas-surfactant simultaneous flow through porous media under conditions where foam forms over only a portion of the model.

15355 **(DOE/MC/22044—3) Improved CO_2 enhanced oil recovery mobility control by in-situ chemical precipitation: Annual report for the period September 1985 to September 1986.** Durham, D.L. (West Virginia Univ., Morgantown (USA)). Feb 1987. Contract AC21-85MC22044. 21p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005310.

The objective of this study is to develop a process that will increase ultimate oil recovery and will improve the operational economics of CO_2 flooding over current state-of-the-art practices. The specific goals of the research work are: to determine and evaluate the optimum conditions and materials for chemical precipitation over a realistic range of reservoir pressures and temperatures; to evaluate the permeability alteration by in-situ chemical precipitation in core samples; to extend the laboratory results to predict the outcome of the field application by modeling and computer simulation; and to determine the expected increase oil recovery through application of the in-situ precipitation to a specific target reservoir. During year one, the following tasks and subtask were completed: Task I - technology review; Task II - experimental design, construction and calibration; and subtask I - precipitation formation of Task III. Accomplishments for these tasks are discussed. The comparison of the ambient and PVT cell test results of precipitation formation indicate that both $CaCl_2$ and $BaCl_2$ have potential for use in core tests. However, at this time the $BaCl_2$ appears to be the better choice. 4 tabs.

15356 **(NP—7900486) 1985/1986 SOMED [School of Mines and Energy Development] project: The effect of temperature, fluid composition, and flow rate on sandstones: implications for enhanced oil recovery methods: Final report.** Donahoe, R.J. (Alabama Univ., University (USA). School of Mines and Energy Development). Sep 1986. 50p. School of Mines and Energy Development, Box 6282, University of Alabama, Tuscaloosa, AL 35486. File Number TI87900486.

A low-temperature hydrothermal flow-through study was conducted experimentally examine fluid/rock interactions brought about in sandstones as a result of fluid injection enhanced oil recovery (EOR) methods. Such studies will eventually enable the development of a predictive model for fluid injection EOR methods. The design of the low-temperature hydrothermal flow-through system allows the accurate control of fluid flow rate (0.002-10 ml/min), temperature (0 to 300°C) and pressure (1 to 500 bar) while flowing fluids through disaggregated solid samples. Samples of St. Peter Sandstone and two different sandstones of the Norphlet Formation from southern Alabama were interacted with distilled, deionized water and a 1% HCl solution at 250°C, 300 bar and 0.1 or 0.5 ml/min fluid flow rate. Solids were analyzed by x-ray powder diffraction and scanning electron microscopy. Fluid samples were analyzed by atomic absorption spectrophotometry and combination pH electrode. A variety of processes which occur in sandstones subjected to fluid injection EOR methods were documented experimentally. Processes damaging to reservoir permeability included iron fouling, silica fouling, migration of clay fines, and precipitation of other secondary phases. Processes resulting in reservoir stimulation involved the dissolution of sandstone framework and/or authigenic mineral constituents. The most successful fluid injection stimulation can be expected for arkosic sandstones containing high percentages of K-feldspar and illite relative to kaolinite, chlorite and smectite, using dilute HCl injection solutions and high fluid flow rates. Fluid chemical data indicate that equilibrium between the solid and injection fluid is not approached for any of the experiments. Therefore, it does not appear that chemical equilibrium computer programs can be used to model these low-temperature reactions. 12 refs., 11 figs., 4 tabs.

15357 **Potential of enhanced oil recovery.** Stosur, J.J.G. (Department of Energy, Washington, DC, USA). *International Journal of Energy Research;* **10**: No. 4, 357-370(Oct-Dec 1986).

This paper presents results of a comprehensive analysis of enhanced oil recovery (EOR) potential in the United States for the rest of this century and beyond with respect to potential rates and ultimate oil recovery. The analysis is based on a resource database consisting of over 2500 reservoirs with approximately 325 billion barrels of the original oil in place and considers two technology cases: a base economic case and an advanced technology case, both with variable oil price assumptions and discounted cash flow rate of return. The results include EOR potential in the United States in terms of ultimate oil recovery and production rate to the year 2013 for each major EOR group of technologies and under varying economic and technological scenarios. The main conclusion of the study indicates that EOR could increase the current domestic crude reserves by approximately 40 per cent for the base case and nearly double the production rate for the implemented technology case.

15358 **Viscoelastic behavior of hydrolyzed polyacrylamide solutions in porous media: Some preliminary observations.** Gao, H.W.; Lorenz, P.B.; Brock, S. (National Institute for Petroleum and Energy Research, Bartlesville, OK 74005). pp 685-693 of Polymeric materials science and engineering. Washington, DC; American Chemical Society (1986). (CONF-860911—).

From 192. American Chemical Society national meeting; Anaheim, CA, USA (7 Sep 1986).

Water-soluble polymers such as polyacrylamides and polysaccharide biopolymers have been used increasingly in many chemical flooding (polymer, micellar/polymer, and alkaline/polymer) projects as mobility control agents to improve sweep efficiency for enhanced oil recovery. Improvement in sweep efficiency is achieved by reduction in water mobility, an increase in water viscosity and/or a reduction in water permeability. Successful use of polymers in any enhanced oil recovery (EOR) process requires understanding polymer rheological behaviour and interactions of the polymers and porous media under reservoir conditions. The purpose of this paper is to explore how these phenomena are affected by changes in polymer and salt concentration, using the polyacrylamide Pusher-500 and a Berea sandstone core.

15359 **Accurate vaporizing gas-drive minimum miscibility pressure prediction.** Benmekki, E.H.; Mansoori, G.A. (Univ. of Illinois). pp 19-30 of Proceedings of the SPE Eastern regional conference. Richardson, TX; Society of Petroleum Engineers (1986). (CONF-861198—).

From Society of Petroleum Engineers eastern regional conference: technology for the economic challenge; Columbus, OH, USA (12 Nov 1986).

Prediction of The Minimum Miscibility Pressure (MMP) of the Vaporizing Gas Drive (VGD) process is modeled using an equation of state with different mixing rules joined with a newly formulated expression for the unlike-three-body interactions between the injection gas and the reservoir fluid. The comparison of the numerical results with the available experimental data indicates that an equation of state alone overestimates the MMP. However, when the equation of state is joined with the unlike-three-body interaction term, the MMP will be predicted accurately. The proposed technique is used to develop a simple and reliable correlation for the accurate vaporizing gas drive MMP prediction.

15360 **Economic evaluation of a CO/sub 2/-enhanced oil recovery flood at the Rock Creek Field, Roane County, West Virginia.** Brummert, A.C.; Ammer, J.R.; Watts, R.J.; King, P.; Boone, D.A. (U.S. DOE/METC). pp 299-308 of Proceedings of the SPE Eastern regional conference. Richardson, TX; Society of Petroleum Engineers (1986). (CONF-861198—).

From Society of Petroleum Engineers eastern regional conference: technology for the economic challenge; Columbus, OH, USA (12 Nov 1986).

The Morgantown Energy Technology Center and The Pennzoil Exploration and Production Company have predicted the recovery and economic potential of a full-field, miscible carbon dioxide, enhanced oil recovery flood at the Rock Creek Oil Field, Roane County, West Virginia. Data used in this evaluation were obtained from two miscible carbon dioxide Rock Creek Field tests: (1) a pilot test consisting of two contiguous, normal five-spot patterns, each containing 10 acres (4 ha), and (2) a 1.55-acre (0.63 ha), normal, four-spot minitest. Core data from the eight injection wells and three observation wells were used to determine reservoir input parameters, and fluid samples were analyzed to obtain fluid properties and determine minimum miscibility pressure. A miscible carbon dioxide predictive model was used to calculate oil recovery and project economics. The base-case run showed that an oil price of $39 per barrel ($245 per cubic meter) was required to produce a 15 percent discounted cash flow rate-of-return. A sensitivity study was then conducted on operating parameters (e.g., pattern size, water-alternating gas ratio, total hydrocarbon pore volumes of water-alternating gas injected, and injection rate) and economic parameters (e.g., oil price and carbon dioxide cost) to determine their effect on project performance and project economics.

15362 **(ORNL/TM—10198) Sensitivity analysis of ORION.** Reister, D.B.; Wright, R.Q. (Oak Ridge National Lab., TN (USA)). Jan 1987. Contract AC05-84OR21400. 102p. NTIS, PC A06/MF A01. File Number DE87005276.

The replacement cost of oil is the constant selling price that will recover the full expenses of exploration, development, and production of domestic crude oil with a reasonable return on capital. The computer code ORION calculates the replacement costs of oil for 20 regions of the United States: 6 onshore regions and 14 offshore regions. The replacement cost depends on parameters like the finding rate for oil, capital costs, operating costs, tax rates, and the discount rate. This report presents the results of a sensitivity analysis of ORION. In the analysis, sensitivity coefficients were calculated for all of the parameters in ORION; the coefficients are defined to be the ratio of the percentage change in the replacement cost to the percentage change of a parameter. The sensitivity analysis of ORION was performed using an automated procedure based on the GRESS precompiler. For both the offshore and onshore regions, the parameter with the largest sensitivity coefficient was the discount rate. The sensitivity coefficient for the discount rate is approximately equal to the lead-time. Since the lead-times are 3 years for the onshore regions and 5 to 15 years for the offshore regions, the discount rate coefficients can be significantly larger than 1.0. For the onshore regions, parameters related to oil production (like the reserve discoveries and the number of exploratory wells) had large sensitivity coefficients. For the offshore regions, a weather parameter had large sensitivity coefficients. 4 refs., 16 tabs.

15363 **(MMS—86-0127-Vol.1) Proposed 5-year Outer Continental Shelf oil and gas leasing program, mid-1987 to mid-1992: Final environmental impact statement: Volume 1.** (Minerals Management Service, Washington, DC (USA)). Jan 1987. 819p. Minerals Management Service, 18th and C Streets, NW, Washington, DC 20240. File Number TI87900476.

This final environmental impact statement considers adoption of a proposed 5-year (Mid-1987 to Mid-1992) Outer Continental Shelf (OCS) oil and gas leasing schedule of 41 oil and gas lease sales in 21 planning areas on the OCS. The proposed schedule consists of 4 sales in the Atlantic Region, 12 sales in the Gulf of Mexico Region, 6 sales in the Pacific Region, 15 sales in the Alaska Region, and 5 small annual supplemental sales. Ten other alternatives and summaries are also described. Impacts to the environment could be caused by oil spills, discharges of drilling fluids, muds, cuttings, formation waters, sanitary wastes, and emissions of pollutants from platforms, refineries and well blowouts. Additional impacts could be caused by physical alteration of the seafloor, land use competition, and social and economic disruption in affected coastal areas. States which could be affected by the proposed action are: Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Delaware, Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas, California, Oregon, Washington, and Alaska. Contents of Volume I include: (1) purpose and need for action; (2) alternatives including the proposed action; (3) affected environment; and (4) environmental consequences by planning area - north Atlantic, mid-Atlantic and south Atlantic.

15364 **Continuous mixture computational algorithm of reservoir fluid phase behavior applicable for compositional reservoir simulation.** Du, P.C.; Mansoori, G.A. (Univ. of Illinois). pp 281-288 of Proceedings of the SPE Eastern regional conference. Richardson, TX; Society of Petroleum Engineers (1986). (CONF-861198—).

From Society of Petroleum Engineers eastern regional conference: technology for the economic challenge; Columbus, OH, USA (12 Nov 1986).

Development of compositional reservoir simulators is presently hampered due to the complexity of the existing computational algorithms of reservoir fluid phase behaviour calculations. Through the application of the theory of polydisperse fluid mixtures the authors have been able to develop a number of algorithms for phase behaviour calculations. In the present report they introduce one of such algorithms. In this algorithm reservoir fluid is considered to consist of a continuous mixture with a defined molecular weight/composition distribution function. Computational computer time required for the new algorithm is shown to be one order of magnitude smaller than the existing algorithms. As an example, the new algorithm is used to perform retrograde condensation calculations for two different gas-condensate reservoir fluids. Comparisons of experimental data with the calculated results indicate good agreement between the two.

15365 **A reexamination of the tropospheric methane cycle: Geophysical implications.** Senum, G.I.; Gaffney, J.S. (Environmental Chemistry Div., Dept. of Applied Science, Brookhaven National Lab., Upton, NY 11973). pp 61-69 of The carbon cycle and atmospheric CO/sub 2/: Natural variations Archean to present. Sundquist, E.T.; Broecker, W.S. Washington, DC; American Geophysical Union (1985). (CONF-840181—).

From American Geophysical Union Monography meeting on carbon dioxide through geologic time; Tarpon Spring, FL, USA (15 Jan 1984).

Existing data concerning sources, sinks, and natural isotopic (/sup 13/C, D, /sup 14/C) abundances of atmospheric methane, a greenhouse gas, are reexamined in light of recent indications of an increasing global atmospheric methane burden. This increase has important geophysical implications with regard to greenhouse effects. Previous evaluations have been revised by updating bacteria source terms and the hydroxyl sink terms. Microorganism-derived source rates have been lowered from 700 +- 130 to 300 +- 140 x 10/sup 12/ g yr/sup -1/. Sink rates for atmospheric methane are dropped from 635 +- 30 to 280 +- 60 x 10/sup 12/ g yr/sup -1/. The revised budget is examined with relation to the known δ/sup 13/C, δD and /sup 14/C methane abundances and found to be in reasonable agreement, with recent biogenic source terms accounting for 80-90% of the observed increase. Although there are limited data, existing δ/sup 13/C and δD yearly trends support this observation. Future needs for measurements are discussed in light of this budget.

15366 **(DOE/OR/00033—T253) Multistate EIA-857 respondent report 1984: Final report.** Boercker, S.W. (Oak Ridge Associated Universities, Inc., TN (USA)). Sep 1986. Contract AC05-76OR00033. 92p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87004880.

Among companies responding to EIA-857, "Monthly Report of Natural Gas Purchases and Deliveries to Consumers," there are 43 companies that file responses for operations in more than one state. In many such cases, one individual completes all EIA-857 forms for the entire company and another individual completes all EIA-176 forms. In some cases, one person is responsible for completing both EIA forms. Therefore, one or two phone calls may serve to reconcile data on several forms. Seven of the multistate responding companies filed matching 1984 data for each state. These respondents are noted on Table 1, which lists all multistate respondents. No further information is given concerning companies that file matching data on all EIA-857 and EIA-176 responses. For each company that files any data that do not agree within 500 Mcf, a sheet describing the company and giving sums of data for the entire company is followed by slightly revised copies of the company sheets included in the "State Reports on Companies Reporting Different 1984 Data on EIA-857 and EIA-176." These company reports are in alphabetical order, and within a company report, responses are arranged in order of decreasing differences in volumes.

15367 **(SAND—86-1865) A numerical signal processing technique for borehole seismic fracture diagnostics.** Engi, D. (Sandia National Labs., Albuquerque, NM (USA)). Jan 1987. Contract AC04-76DP00789. 86p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87005623.

The potential economic value of determining the geometry of hydraulic fractures for reservoir engineering is well established. Borehole seismic systems utilizing the polarization method of analysis have been successfully employed in numerous hydraulic fracture mapping experiments. The sensor for the borehole seismic system is a tool consisting of three sets of orthogonally oriented geophones that sense the magnitude of the rectilinear components of seismic signals from which the direction of incidence of the seismic signal

can be determined. This paper describes the methods for analyzing this angular data and for combining the data from more than one tool into a single estimate of the location of the origin of the seismic signal. 9 refs., 26 figs., 8 tabs.

15368 **(CONF-8604218—7) Applications of economic analysis in gas distribution.** Wilson, G.G. (Institute of Gas Technology, Chicago, IL (USA)). Apr 1986. 26p. Institute of Gas Technology, 3424 South State Street, Chicago, IL 60616. File Number TI87900441.

From American Gas Association: distribution/transmission conference; Chicago, IL, USA (28 Apr 1986).

This is a summary of the results of a survey of current applications of economic analysis by 19 gas distribution companies. It covers all areas of activity in which economic analysis is likely to be used.

0340 Combustion

15369 **Combustion-torch ignition: Fluorescence imaging of NO/sub 2/.** Cattolica, R.J. (Sandia National Labs.). pp 26 of Proceedings of the 21st symposium (international) on combustion. Pittsburgh, PA; Combustion Institute (1986). (CONF-860804—).

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

Combustion-torch ignition of a lean methane-air mixture (phi=0.65) in a divided-chamber combustion vessel was studied using planar-induced fluorescence imaging of nitrogen dioxide (NO/sub 2/) doped into the reactants at a trace concentration (700 ppm). In the experiments the gas velocity of the combustion torch was systematically increased by reducing the diameter of the exit orifice of the prechamber used to form the torch. With this increase in velocity, the character of the flow field of the combustion torch was altered from laminar to turbulent conditions with the Reynolds number increased from 4290 to 17183. At the highest Reynolds number condition, significant enhancement of the rate of combustion was indicated by factor of 10 to increase in the rate of pressure rise and a 20 percent increase in peak pressure in the combustion chamber. This enhanced combustion rate is a consequence of mixing the combustion products from the combustion torch with unburned reactants. Reactive intermediate species, high-temperature gas and turbulent fluid motion in the combustion products have all been suggested as important elements in enhancing combustion with torch ignition. The NO/sub 2/ fluorescence-imaging measurements indicate that intermediate radicals and high-temperature gas from the combustion torch do not initiate any significant chemical reaction in the unburned reactants ahead of the propagating flame, which could enhance the rate of combustion.

15370 **High-resolution coherent anti-Stokes Raman spectroscopy measurements of carbon monoxide linewidths in a flame.** Farrow, R.L. (Sandia National Labs.). pp 14 of Proceedings of the 21st symposium (international) on combustion. Pittsburgh, PA; Combustion Institute (1986). (CONF-860804—).

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

The authors have used a high-resolution (0.005 cm/sup -1/) coherent anti-Stokes Raman spectroscopy (CARS) experiment to obtain fully resolved CARS spectra in a flame. Spectra of Q-branch transitions of CO and O-branch transitions of N/sub 2/ were analyzed to obtain J-dependent Raman linewidths. The CO linewidths are compared to infrared P- and R-branch linewidths measured by other workers in similar rich methane/air flames. The results demonstrate the utility of high-resolution CARS in providing needed spectral information for applying conventional CARS to combustion environments.

(USDOE Morgantown Energy Technology Center, WV; EG and G/Washington Analytical Services Center, Inc., Morgantown, WV (USA)). Oct 1986. 526p. (CONF-860717—). NTIS, PC A23/MF A01; 1; GPO Dep. File Number DE87001002.

From 2. tar sand symposium; Jackson, WY, USA (8 Jul 1986).

The 1986 Tar Sand Symposium was sponsored by the Laramie Project Office of the Morgantown Energy Technology Center, US Department of Energy, and hosted by the Western Research Institute, University of Wyoming Research Corporation, in Jackson, Wyoming, on July 7 to 10, 1986. The 10-session symposium included 36 presentations describing research, development, and commercial application of tar sand technologies of the US, Canada, the Federal Republic of Germany, Switzerland, and Venezuela. Over 80 participants represented the US, Canada, Germany, Japan, and Switzerland. The papers printed in the proceedings have been reproduced from camera-ready manuscripts furnished by the authors. The papers have not been referred, nor have they been edited extensively. All papers have been processed for inclusion in the Energy Data Base.

0405 Properties And Composition

REFER ALSO TO CITATION(S) 15331, 15371

15372 **(NP—7770047) Origins of the Messel oil shale and structure of petroporphyrins.** Springer, G. (Hannover Univ. (Germany, F.R.). Fachbereich Chemie). 13 Feb 1985. 209p. (In German). NTIS (US Sales Only), PC A10/MF A01. File Number DE87770047.

Porphyrins, which are ubiquitous in sediments, occur in the Messel region almost exclusively as vanadyl or nickel complexes. They are assumed to be derivatives of chlorophyll a and b. Their occurrence in this form is not considered as a phenomenon of biological significance but rather as the result of a process of selection. According to this point of view, the quantitative ratio of the vanadyl and nickel prophyrins should be reflected at least qualitatively by the vanadium/nickel ratio at the site. This is not the case in the Messel oil shale which has about equal vanadium and nickel concentrations but contains exclusively nickel-coordinated porphyrins. The recent observation that the methanogenic bacteria occurring in the anaerobic zones of sediments produce porphinoid nickel complexes by a process of biosynthesis suggests that a biological origin of the nickel central atoms cannot be excluded.

15373 **(UCRL—53273-Rev.1) Assay products from Green River oil shale.** Singleton, M.F.; Koskinas, G.J.; Burnham, A.K.; Raley, J.H. (Lawrence Livermore National Lab., CA (USA)). 18 Feb 1986. Contract W-7405-ENG-48. 206p. NTIS, PC A10/MF A01; 1; GPO Dep. File Number DE87005924.

Data from 66 material-balanced assays conducted at Lawrence Livermore National Laboratory, Laramie Energy Technology Center, and The Oil Shale Corporation were compiled and analyzed to determine the pyrolysis stoichiometry for Green River for-

mation oil shales originating in and near the Mahogany zone. Shale samples came from four sites in Colorado and one in Utah, and ranged in oil content from 12 to 258 L/Mg (3 to 62 gal/ton). Average values and pairwise correlation coefficients are reported for all data available on the shales, e.g., elemental analyses of shales and oils, distribution of organic carbon in products, gas composition, and some ratios of elemental composition. Some sulfur data have been added to the assay sheets in the revised publication and appear with the stoichiometry and average values, but not with the correlation studies. The wide range of organic carbon contents made it possible to demonstrate the sensitivity of assay product distribution to oil shale grade. A linear correlation for shale grade as a function of weight percent organic carbon in raw shale is presented. An average stoichiometry for pyrolysis of the organic material is also calculated and compared with others available in the literature. 41 refs., 12 figs., 11 tabs.

15374 **Identification of organic compounds in the bitumen of Chattanooga oil shale.** McGowan, C.W.; Greenwell, B.E.; Crouse, D.J.; Markuszewski, R.; Richard, J.J.; Sepaniak, M.J. (Dept. of Chemistry, Tennessee Tech. Univ., Cookeville, TN 38505). *Preprints of Papers, American Chemical Society, Division of Fuel Chemistry;* **31**: No. 3, 294-299(1986). (CONF-8609181—).

From ACS symposium on syngas conversion catalysis advances in gasification; Santa Clara, CA, USA (7 Sep 1986).

The bitumen of Chattanooga oil shale has been extracted with benzene. The benzene-soluble material was separated into acid, base and neutral fractions with ion exchange chromatography. This separation scheme has been used extensively to separate the organic material in Green River oil shale. The acid fraction was esterified with BF/sub 3//MeOH. A large portion of the acid fraction was not esterified and this material was considered to be phenolic. The bases were separated into two fractions using alumina. The esters, the two base fractions and the total neutral fraction were analyzed using gas chromatography coupled to mass spectrometry. Two series constituting the methyl esters of normal carboxylic acids and carboxylic acids containing one double bond were identified. No homologous series were indicated in the base fraction. The base fraction was highly aliphatic. The major components in the neutral fractions were two series constituting normal and isoprenoid alkanes. A series of cycloalkanes and a series of alkenes were also indicated. The analysis scheme employed functions well for the separation and identification of aliphatic materials.

15375 **(DOE/FE/60177—2224) Quality of leachate from retorted oil shale wetted with treated process waters.** Clark, J.A.; Sorini, S.S. (Western Research Inst., Laramie, WY (USA)). Mar 1985. Contract FC21-83FE60177. 12p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87002264.

Retorted oil shale samples were moistened with five different treated process waters and then leached following the American Society for Testing and Materials method D3987. Concentrations of total inorganic carbon, arsenic, boron, barium, cadmium, chromium, molybdenum, lead, antimony, selenium, strontium and vanadium were measured by inductively coupled argon plasma emission spectroscopy in both the process waters and the leachates from the moistened oil shale samples. Moistening the retorted oil shale with the treated process waters did not result in elemental adsorption by the oil shale and may have generally decreased the quality of the leachates. Long-term equilibrium studies are recommended for further evaluation of codisposal with treated process waters. 6 refs., 3 tabs.

15376 **(DP—1709) Online plutonium x-ray fluorescence analyzer system in F-Canyon.** Parry, R.F. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Feb 1986. Contract AC09-76SR00001. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005568.

An online plutonium and free-acid analyzer system was tested on the second plutonium solvent-extraction cycle product tank-sampler in F-Canyon at the Savannah River Plant. The analyzer system produced: $< 0.5\%$ (1σ precision) plutonium values in 40 minutes, and 5.0% (1σ) plutonium and free-acid results within five minutes.

15377 **(HEDL-SA—3534-FP) Interfacing robotics with plutonium fuel fabrication.** Bowen, W.W.; Moore, F.W. (Hanford Engineering Development Lab., Richland, WA (USA)). 14 Nov 1986. Contract AC06-76FF02170. 7p. (CONF-870301—18). NTIS, PC A02. File Number DE87005480.

From International topical meeting on remote systems and robotics in hostile environments; Pasco, WA, USA (29 Mar 1987).

Interfacing robotic systems with nuclear fuel fabrication processes resulted in a number of interfacing challenges. The system not only interfaces with the fuel process, but must also interface with nuclear containment, radiation control boundaries, criticality control restrictions, and numerous other safety systems required in a fuel fabrication plant. The robotic system must be designed to allow operator interface during maintenance and recovery from an upset as well as normal operations.

15378 **On the correlation between fuel structure and mechanical properties of UO/sub 2/.** Blank, H.; Mandler, R.; Matzke, H.; Routbort, J.; Werner, P. (Commission of the European Communities, Joint Research Centre, Karlsruhe Establishment, European Institute for Transuranium Elements, Postfach 2266, D-7500 Karlsruhe). pp 137-152 of Water reactor fuel element performance computer modelling. Gittus, J. New York, NY; Elsevier Science Pub. Co. Inc. (1983).

The relation between the structure of a UO/sub 2/ fuel and its mechanical properties are discussed and illustrated for particular types of UO/sub 2/ by measurements of fracture surface energy, hardness, fracture stress and compressive deformation at 1870 and 1970 K. This gives the background for treating the question whether it is possible to find a simple experimental method for correlating the mechanical properties of UO/sub 2/ before irradiation with those after various irradiation histories. Hardness measurements might be such a method if combined with a detailed structural analysis and sufficient knowledge about the irradiation history. However, for a meaningful interpretation of the data the presently available 'classical' methods of fracture mechanics are inadequate and, furthermore, sufficient additional (not yet available) information on the relations between mechanical properties and structural details are required.

15379 **(CEA-CONF—8370) CEA R and D contribution to the La Hague extension plant.** Auchapt, P.; Bonniaud, R.; Bourgeois, M.; Courouble, J.M.; Tarnero, M. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Jun 1986. 7p. (CONF-860603—12). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750471.

From 4. European nuclear conference and 9. FORATOM congress (ENC '86) and international nuclear trade fair; Geneva, Switzerland (1 Jun 1986).

Through its subsidiary COGEMA, the CEA Group is engaged in building a very large industrial complex, designed to raise French capacity for reprocessing LWR fuels to 1600 t/year. This refers to the UP3 and UP2-800 plants currently being built at La Hague. Naturally, the well-known "Purex" process is employed in its main features, since it has proved entirely satisfactory in the UP2 facilities. Scaling up, essentially applied to capacity and aiming at a factor of 4, nevertheless requires a thorough re-assessment of all the steps in the process. Main research topics include components for bulk chopping of the fuel bundle (blades, roller, rails, ventilation, anticorrosion barriers) dissolution, liquid-liquid extraction solvent recycling, PuO_2 redissolution, liquid and solid waste treatment.

15380 **(CEA-CONF—8524) Marcoule pilot plant.** Faugeras, P.; Calame Longjean, A.; Le Bouhellec, J.; Revol, G. (CEA Etablissement de la Vallee du Rhone, 30 - Bagnols-sur-Ceze (France)). Jun 1986. 6p. (CONF-860603—11). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750470.

From 4. European nuclear conference and 9. FORATOM congress (ENC '86) and international nuclear trade fair; Geneva, Switzerland (1 Jun 1986).

The Marcoule spent fuel reprocessing pilot facility was built in 1960-1961 for extended testing of the PUREX process with various types of fuel under conditions similar to those encountered in a production plant. Extensive modification work was undertaken on the facility in 1983 in the scope of the TOR project, designed with the following objectives: increase the throughput capacity to at least 5 metric tons of PHENIX equivalent fuel per year; extend equipment and process R and D capability; improve job safety by maximum use of remote handling facilities; maximize waste conditioning treatments to produce waste forms suitable for direct storage; provide a true industrial process demonstration in continuous operation under centralized control using computerized procedures. The redesigned plant is scheduled to begin operation during the second half of 1986. The proximity of the Industrial Prototypes Service and the ATALANTE radiochemical research laboratory scheduled to begin operation in 1990, will provide a synergistic environment in which R and D program may be carried out under exceptional conditions.

15381 **(CNIC—00002) Recovery of /sup 238/Pu from irradiated /sup 237/Np using anion exchange method.** (China Nuclear Information Centre, Beijing, BJ). Apr 1986. 13p. (In Chinese). (IAE—0002). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701272.

A process for recovering and purifying /sup 238/Pu from irradiated NpO/sub 2/ target by anion exchange method is described in detail. Related results obtained in the technological experiment for the process are given. First, absorb and desorb behaviour of /sup 237/Np-/sup 239/Pu on the anion exchange column using /sup 237/Np and /sup 239/Pu, various factors effecting /sup 237/Np//sup 239/Pu separation were investigated, then, we selected technical parameters for the four cycles process. Finally, a 'hot' experiment was conducted using an irradiated NpO/sub 2/ target. The cross-contamination of /sup 237/Np and /sup 238/Pu is less than 1%, the total recoveries of /sup 237/Np and /sup 238/Pu are respectively 99.6% and 98.1%. The total γ elimination coefficient of /sup 237/Np-/sup 238/Pu obtained in the first anion exchange cycle is 2.4 x 10/sup 3/.

15382 **(CNIC—00003) High-sensitive and quantitative in-line monitoring method for transplutonium elements separation processes.** (China Nuclear Information Centre, Beijing, BJ). Apr 1986. 11p. (In Chinese). (IAE—0003). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701273.

A high-sensitive monitoring device and a quantitative analys technigue for transplutonium elements separation processes are described. X-ray and low energy γ-ray are measured by means of a scintillation monitor with two NaI(Tl) thin crystals. The α spectra of the fluents of ion-exchange column is measured by means of Si(Au) surface barrier in-line monitor. The construction of the monitors, auxiliary electronics, investigation result for the α spectra character of thick source and the calibration method were described. The determination results for extracting process of /sup 243/Am and /sup 244/Cm by ion-exchange chromatography were given. The sensitivity of total adding amount for /sup 243/Am using the 4π scintillation monitor is better than 0.1 μCi. The precision of /sup 243/Am and /sup 244/Cm concentration determination using Si(Au) monitor is +- 5%. The precision of the two metals contents in containers is about +- 10%.

15383 **(CONF-861146—14) The application of electrorefining for recovery and purification of fuel discharged from the Integral Fast Reactor.** Burris, L.; Steunenberg, R.K.; Miller, W.E. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 36p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004746.

From AIChE winter annual meeting; Miami, FL, USA (2 Nov 1986).

An electrorefining process employing a molten salt electrolyte and a molten cadmium anode is proposed for the separation of uranium and plutonium from fission products and cladding material in discharged IFR driver fuel. The use of a liquid cadmium anode, which is the unique feature of the process, permits selective dissolution of the fuel from the cladding and prevents electrolytic corrosion of the steel container and contamination of the product by noble metal fission products.

15384 **(CONF-8610156—2) The integral fast reactor fuels reprocessing laboratory at Argonne National Laboratory, Illinois.** Wolson, R.D.; Tomczuk, Z.; Fischer, D.F.; Slawecki, M.A.; Miller, W.E. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 22p. NTIS, PC A02/MF A01. File Number DE87004859.

From Plutonium/uranium chemical recovery operations conference; Aiken, SC, USA (14 Oct 1986).

The processing of Integral Fast Reactor (IFR) metal fuel utilizes pyrochemical fuel reprocessing steps. These steps include separation of the fission products from uranium and plutonium by electrorefining in a fused salt, subsequent concentration of uranium and plutonium for reuse, removal, concentration, and packaging of the waste material. Approximately two years ago a facility became operational at Argonne National Laboratory-Illinois to establish the chemical feasibility of proposed reprocessing and consolidation processes. Sensitivity of the pyroprocessing melts to air oxidation necessitated operation in atmosphere-controlled enclosures. The Integral Fast Reactor Fuels Reprocessing Laboratory is described.

15385 **(DP—1673) Reprocessing fuel from the Southwest Experimental Fast Oxide Reactor at the Savannah River Plant.** Gray, L.W.; Campbell, T.G. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Nov 1985. Contract AC09-76SR00001. 23p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005575.

The irradiated fuel, reject fuel tubes, and fuel fabrication scrap from the Southwest Experimental Fast Oxide Reactor (SEFOR) were transferred to the Savannah River Plant (SRP) for uranium and plutonium recovery. The unirradiated material was declad and dissolved at SRP; dissolution was accomplished in concentrated nitric acid without the addition of fluoride. The irradiated fuel was declad at Atomics International and repacked in aluminum. The fuel and aluminum cans were dissolved at SRP using nitric acid catalyzed by mercuric nitrate. As this fuel was dissolved in nongeometrically favorable tanks, boron was used as a soluble neutron poison.

15386 **(DP—1718) Hot canyon crane operating problems and equipment failures: F-Canyon Reprocessing Facility, Savannah River Plant.** Durant, W.S.; Galloway, W.D. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Feb 1986. Contract AC09-76SR00001. 132p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE87005569.

A compilation of operating problems and equipment failures affecting the operability and safety of the hot canyon crane in the Savannah River Plant F-Canyon Fuel Reprocessing Facility is presented. These data have been collected over the 30-year operation of the facility. Data have been sorted by crane component or operating problem to facilitate usage. A brief description of the crane and the data bank from which the information was sorted is also included. At no time have the operating problems or equipment failures listed in this report resulted in serious injury to operating personnel. 6 refs., 1 fig., 3 tabs.

15387 **(DP-MS—86-167) Interfacing solvent extraction in the recovery of pyrochemical residues at the Savannah River Plant.** Gray, L.W.; Holcomb, H.P. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 07 Oct 1986. Contract AC09-76SR00001. 12p. (CONF-8610226—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004187.

From 6. annual plutonium pyrochemical workshop; Los Alamos, NM, USA (7 Oct 1986).

The traditional feedstock for plutonium recovery at the Savannah River Plant (SRP) has been spent reactor fuel elements and irradiated targets. Feed sources have included both onsite reactors and a wide variety of domestic and foreign reactors. For the past few years, a growing and increasingly varied mix of unirradiated plutonium residues has been purified through SRP aqueous-based processes. Recently, plutonium residues generated in various chloride salt melts have become a significant offsite source of feed for SRP recovery operations. Impure plutonium metal and plutonium alloys have also been processed. A broader range of molten salt and other high temperature residues is anticipated for the future. The major advantage of solvent extraction for scrap purification is the versatility of the solvent extraction system which allows numerous contaminants to be removed by routine operations. Major concerns are nuclear safety control, corrosion of equipment, and control of releases to the environment. SRP's past, present, and future interfacing of solvent extraction in processing pyrochemical and other plutonium-containing residues is reviewed.

15388 **(INIS-mf—10312) Preliminary statement concerning the expert opinion and other documents relating to the Wackersdorf fuel reprocessing plant, laid open between June 18 and July 15, 1985 by the Bavarian Ministry of State for Regional Development and Environmental Affairs.** (Institut fuer Angewandte Oekologie, Darmstadt (Germany, F.R.). Projektgruppe Reaktorsicherheit; Arbeitsgruppe Wiederaufarbeitung an der Univ. Bremen (Germany, F.R.)). 30 Jul 1985. 41p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE87750498.

Werkstattreihe. No. 19.

The conclusion drawn in the statement is that the expert opinions and documents available do not justify the granting of a first partial licence for the erection of the fuel reprocessing plant. Such a first partial licence would include the site approval, the outline design approval, and part-construction permits, in this case for instance for the fuel element receiving store. The site approval would be a premature decision according to this statement, as some decisive expert opinions (on meteorological, hydrological, and radioecological site conditions) are not yet completed. The documents available for evaluation of the design concept are said to have been insufficient in many regards, so that all the authors can state at the present time is that 'there may be technically feasible solutions by now'. This is judged to be an insufficient basis for an outline design approval in accordance with the Atomic Energy Act. The reasons brought forward against licensing the fuel element receiving store are similar. For lack of appropriate documents, the authors of the statement found themselves unable to assess the safety of a major component, the fuel element storage tank. (orig./HSCH).

15389 **(ORNL/TM—10256) Consolidated Fuel Reprocessing Program: Progress report for period July 1 to September 30, 1986.** Feldman, M.J.; Groenier, W.S.; Stradley, J.G.; Yarbro, O.O. (Oak Ridge National Lab., TN (USA)). Feb 1987. 29p. NTIS, PC A03/MF A01. File Number DE87005269.

Progress reports are presented in overview fashion for the following: (1) process and engineering R and D; (2) engineering systems; (3) integrated equipment test facility operations; and (4) strategic planning and analysis;

15390 **German bundle shear - cold test results.** Kunze, P. (Wiederaufarbeitungsanlage Karlsruhe, West Germany). *Transactions of the American Nuclear Society;* **53**: 118-119(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the planned Federal Republic of Germany (FRG) reprocessing plant, the mechanical decladding of the fuel elements will be done with a bundle shear. This shear was designed and built with Thyssen Henschel by adapting the experiences of the Wiederaufarbeitungsanlage Karlsruhe (WAK), the FRG reprocessing pilot plant. The tests included boiling water reactor (BWR) and pressurized water reactor (PWR) dummy elements filled with porcelain as well as steel fuel rod simulators. During the test period with prototype bundle shear, some technical improvements have been found that refer both to operating conditions and to remote handling. In 1987 the acceptance tests will be run.

15391 **Close-fitting shield doors with sculptured edges.** Goodman, L. (Fluor Engineering, Inc., ATD, Irvine, CA). *Transactions of the American Nuclear Society;* **53**: 484-485(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The US Department of Energy has contracted with Fluor Technology, Inc. for design and engineering of a facility to begin reprocessing fuel from the reactors at Hanford, Washington. Within the facility, a 15-cm (6-in.)-thick, steel shield door is needed to close an opening 4.3 m (14 ft) high x 8.2 m (27 ft) wide. Two cranes and a centrally located monorail hoist must pass through the opening. The door weighs about 41,000 kg (45 ton), and passage of the hoist will be the most frequent cause for opening the door. These two factors essentially mandated a three-piece door, which allows for using commercially available chain hoists to raise and lower the individual door sections. Normally, there is a 187-Pa (0.75-in. water gauge) pressure differential across the door, and minimal air leakage is essential. Stepped, mating edges between sections and along the adjacent concrete structures are typical with such doors, but so are significant gaps (and air leaks) around the edges. Gaps are needed to preclude frictional jamming between edges as a section is lowered. The challenge was to conceive a method to produce near-zero gaps and preclude jamming without involving impractically tight tolerances. The chosen method was to place trapezoidally shaped, steel gaskets on the door-section edges and on the mating concrete surfaces. The concept is described.

15392 **Design and construction status of the fuel processing facility.** Bingham, G.E. *Transactions of the American Nuclear Society;* **53**: 157-158(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A new facility is being designed and built at the Idaho Chemical Processing Plant (ICPP) at the Idaho National Engineering Laboratory (INEL) near Idaho Falls, Idaho. The new facility, the Fuel Processing Facility (FPF), will replace existing ICPP facilities that have been in operation for almost 35 yr. The new facility will include three cycles of uranium extraction, product denitration and product storage, along with the necessary support equipment, systems, and facilities to provide a fully acceptable uranium extraction facility. The FPF design is presently ~40% complete. Site preparation and excavation are also complete. Selected long-lead procurement is in progress. Construction is scheduled to be completed in December 1992 with hot operation in December 1994.

15393 **Process facility modifications project.** Hinckley, J.P.; Alaconis, W.C. (Rockwell Hanford Operations, Richland, WA). *Transactions of the American Nuclear Society;* **53**: 159-160(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Process Facility Modification Project (PFM) is a US Department of Energy (DOE) project which is designed to replace the existing head-end of the Plutonium Uranium Extraction (PUREX) Plant at the DOE's Hanford, Washington facilities. The purpose and need for the PFM project are twofold. First, it is desired to recover the plutonium loaned to the DOE's breeder reactor research program by the DOE's Defense Program. This plutonium is being used as fuel in the Fast Flux Test Facility (FFTF) at Hanford, Washington. The fuel consists of a mixture of PuO/UO clad in stainless steel tubes. There are presently no US facilities which can reprocess stainless-steel-clad fuel. Therefore, to recover this plutonium a new facility which uses a chop/leach process must be constructed. Secondly, it is desired to use more modern reprocessing techniques to reduce the volume of high-level liquid radioactive waste produce by PUREX. By replacing the current Zirflex headed with the chop/leach process, the amount of liquid waste generated when reprocessing N Reactor fuel can be reduced by ~90%.

15394 **Design and testing of remote handling systems for reprocessing plant maintenance and for nuclear reactor dismantling.** Baier, J.; Blaseck, K.; Krieger, F.; Kuhn, R.; Leister, P. (Noell and Co., Wuerzburg, West Germany). *Transactions of the American Nuclear Society;* **53**: 515-516(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In 1986 two important milestones will be reached in the field of remote handling technology in Germany: 1. The prototype of the manipulator carrier system with power manipulator (MTS) for the reprocessing plant in Wackersdorf will be completed and cold test operation will be started. 2. The dismantling manipulator with all special tools for the demolition of the Niederaichbach nuclear power station will be completed and cold test under mockup conditions. Both system were designed, constructed, and tested by Noell GmbH in Wuerzburg. The report describes main features of the design, the problems in fabrication and the first test results.

15395 **Remote maintenance in the TOR fast reactor fuel reprocessing facility.** Eymery, R.P.; Constant, M.; Malterre, G. (CEA, Grenoble, France). *Transactions of the American Nuclear Society;* **53**: 516-517(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The TOR facility which is undergoing commissioning tests has a capacity of 5 tonne HM/yr which is enough for reprocessing all the Phenix fuel, with an excess capacity which is to be used for other fast reactors' fuels. TOR will also be used to test new equipment developed for the large breeder fuel reprocessing plant presently in the design stage. The latter objective is specifically important for the parts of the plant involving mechanical equipment which are located in a new building: TOR 1. The basic principles in TOR 1 are the following: 1. The mechanical process operations will be automatic. 2. Test operations may be conducted on experimental units without disturbing the main process line. 3. The process equipment is built on a modular basis. 4. Removing or replacement of a module is a simple operation which can be done in a short time (<1 day). 5. Means have been provided for the circulation of technological and process wastes inside the active containment, without cask transfer. Remote handling equipment integrated maintenance methods, and maintenance tests are described.

15396 **Aspects of remote maintenance in an FRG reprocessing plant from the manufacturer's viewpoint.** Zeitzchel, G.; Tennie, M.; Saal, G. (Kraftwerk Union, Offenbach, West Germany). *Transactions of the American Nuclear Society;* **53**: 517-518(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In April 1986 a consortium led by Kraftwerk Union AG was commissioned by the German society for nuclear fuel reprocessing (DWK) to build the first West German commercial reprocessing plant for spent fuel assemblies. The main result of the planning efforts regarding remote maintenance operations inside the main process building was the introduction of FEMO technology (FEMO is an acronym based on German for remote handling modular technique). According to this technology the two cells in which the actual reprocessing (which is based on the PUREX technique) takes place are provided with frames to accommodate the process components (tanks, pumps, agitators, etc.), each frame together with the components which it supports forming one module. The two cells are inaccessible and windowless. For handling operations each cell is equipped with an overhead crane and a crane-like manipulator carrier system (MTS) with power manipulator. Viewing of the operations from outside the cells is made possible by television (TV) cameras installed at the crane, the MTS, and the manipulator. This paper addresses some examples of problems that still need to be solved in connection with FEMO handling. In particular, the need for close cooperation between the equipment operator, the component designer, the process engineer, the planning engineer, and the licensing authorities will be demonstrated.

0509 Transport And Storage

REFER ALSO TO CITATION(S) 15386, 15489, 16446

15397 **(EGG—2491) Virginia Power and Department of Energy spent fuel transportation experience.** Ruska, M.D.; Schoonen, D.H. (EG and G Idaho, Inc., Idaho Falls (USA)). Dec 1986. Contract AC07-76ID01570. 70p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87004884.

Spent fuel assemblies for the Spent Fuel Storage Cask Testing Program conducted by EG & G Idaho, Inc., at the Idaho National Engineering Laboratory (INEL) were transported to the INEL. A total of 69 spent fuel assemblies (23 shipments) were shipped from Virginia Power's nuclear power plant at Surry, Virginia, to the INEL between July 1985 and June 1986 to fill and test three spent fuel storage casks. The shipments were made over the highway system in Transnuclear, Inc., TN-8L shipping casks on specially constructed trailers. The shipments were moved by diesel tractors owned and operated by Tri-State Motor Transit Company of Joplin, Missouri. The gross vehicle weight for each shipment was 112,000 lb, which was a major consideration when selecting routes for the shipments. Cooperative negotiations with officials for the 17 states involved obtained authorization to transport through their states. The shipping campaign was successfully completed through close communication and cooperation and careful planning and operation by all organizations involved.

15398 **(EGG-NERD—7444) Criticality safety evaluation for pathfinder fuel elements in model No. RA-3 shipping containers.** Jones, R.R. (EG and G Idaho, Inc., Idaho Falls (USA)). Nov 1986. Contract AC07-76ID01570. 29p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004540.

Pennsylvania State University presently processes approximately 415 Pathfinder fuel elements which will require shipment from their nuclear facility. Criticality safety calculations have been performed with the Monte Carlo code, KENO-IV, and 16-group Hansen-Roach cross sections for shipment of these fuel elements in Model No. RA-3 shipping containers. Except for a slightly higher U-235 enrichment in the UO_2 rods of the Pathfinder fuel elements, the parameters for the proposed shipment are within those limits currently approved in Certificate of Compliance No. 4986, Revision No. 17, for shipment of UO_2 fuel rods in the Model RA-3 shipping containers. The analysis in this report verifies an adequate margin of criticality safety for the Pathfinder fuel elements in Model RA-3 containers for a Fissile Class 1 shipment.

15399 **(INIS-XN—47) Transport of dangerous substances by road.** (International Atomic Energy Agency, Vienna (Austria)). 1985. 191p. (In Finnish). NTIS (US Sales Only), PC A09/MF A01. File Number DE87701309.

This book is a collection of the Finnish acts and regulations concerning transport of dangerous substances by road as of 31st March 1985. Included are: Act and Decree on the Transport of Dangerous Substances by Road (No's. 510/74 and 861/74), both as amended; Decree setting up a related Commission (No. 862/74), as

amended; Act on the Contract for Carriage of Goods by Road (No. 345/79); Decree bringing into force the ADR (No. 289/79); and Decision of the Ministry of Communications on the Transport of Dangerous Substances by Road (No. 610/78) as amended by Decisions No. 344/79, 995/79, 218/82 and 935/83. (NEA).

15400 **Behavior of breached pressurized water reactor spent-fuel rods in an air atmosphere between 250 and 360°C.** Einziger, R.E.; Strain, R.V. (Westinghouse Hanford Co., P.O. Box 1970, Richland, WA 99352). *Nuclear Technology;* **75**: No. 1, 82-95(Oct 1986).

Oxidation tests on spent-fuel fragments and rod segments were conducted between 250 and 360°C to relate temperature and defect size to fuel oxidation rate and time-to-cladding-splitting. Defect sizes from an equivalent circular diameter of 8 μm (the approximate size of a stress-corrosion-cracking-type breach) to 760 μm were used. Samples, held at temperature in a flowing air atmosphere, were frequently weighed and visually observed to determine the oxidation rate and effects of oxidation. Both the size and shape of the defect appear to influence the time-to-cladding-splitting. Above 283°C, time-to-cladding-splitting was longer for the sharp small defect than for the large circular defect, an effect that diminished as the temperature decreased. By 250°C the sharp small defects split open before the large circular defects, indicating that, at lower temperatures, the defect's shape and not its size may be more important when determining time-to-cladding-splitting. At both 283 and 295°C, the defects in fuel rod segments with lower burnups propagated sooner than those in rod segments with higher burnup from the same parent rod. The cumulative damage fraction approach, using a reasonable decreasing time/temperature profile, was applied to determine time-to-cladding-splitting for pressurized water reactor (PWR) fuel with a burn up >640 MWh/kg of uranium. Breached PWR fuel rod will not split open from fuel oxidation during 100 yr of storage if the rod is not exposed to air until the temperature drops below 230°C. Lower burnup fuel apparently requires lower temperature limits. The temperature limits appear to depend more on the time/temperature profile in the storage container than on oxidation rates.

15401 **Spent-fuel transportation - a success story.** Gertz, C.P.; Schoonen, D.H.; Wakeman, B.H. (DOE, Idaho, Idaho Falls). *Transactions of the American Nuclear Society;* **53**: 120(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Spent nuclear fuel research and development (R & D) demonstrations and associated transportation activities are being performed as a part of the storage cask performance testing programs at the Idaho National Engineering Laboratory (INEL). These spent-fuel programs support the Nuclear Waste Policy Act (NWPA) and US Department of Energy (DOE) objectives for cooperative demonstrations with the utilities, testing at federal sites, and alternatives for viable transportation systems. A cooperative demonstration program with the private sector to develop dry storage technologies that the US Nuclear Regulatory Commission (NRC) can generically approve is in place as well as cost-shared dry storage R & D program at a federal facility to collect the necessary licensing data. In addition to the accomplishments in the cask performance and testing demonstrations, the long-distance transportation of a large number of spent-fuel assemblies is considered a success story. The evaluation and implementation of applicable requirements, industry perspective, and extensive planning all contributed to this achievement.

15402 **Preliminary characterization of radioactive crud for design of dry spent-fuel handling facilities.** Jardine, L.J. *Transactions of the American Nuclear Society;* **53**: 120-121(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Conceptual designs are being developed in the US for facilities that receive, handle, and package spent fuel from commercial reactor sites. Current designs for the monitored retrieval storage facility or geologic repositories utilize dry spent-fuel handling methods based on adaptations of both wet spent-fuel handling and shielded hot cell technologies. This paper summarizes the results of a study that compiled from the published literature and estimated certain key characteristics of crud deposits associated with boiling water reactor and pressurized water reactor spent-fuel assemblies. The estimates can be used to determine potential releases of crud contamination and to develop associated design requirements for dry spent-fuel handling facilities. Radiation dose rates were also estimated for 10^{-2}- to 10^{-6}-cm-thick layers of crud deposited on structural and equipment surfaces. Such estimates can serve as a basis for selecting maintenance and decontamination equipment. It is recommended that further crud characterization be undertaken to support ongoing facility designs and future licensing actions. Emphasis should be placed on estimating fractional crud releases from spent-fuel assemblies for various transportation modes and handling methods.

15403 **Seismic behavior of spent-fuel racks supported by aseismic bearing devices.** Alliot, P. (Framatome-France, Courbevoie). *Transactions of the American Nuclear Society;* **53**: 122-124(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The governing loads acting on a spent-fuel rack are seismic loads due to the horizontal components of earthquake floor motion. For racks supported by pads and which are free standing on the pool floor, these loads are amplified by the dynamic response of the rack structure. With the use of neutron-absorbing material leading to higher density storage of assemblies, there is a need to design a base isolation that would support the racks and uncouple them from the horizontal floor accelerations. Framatome has designed and qualified a base isolation system consisting of two orthogonal layers of rollers, which can accommodate both horizontal ground motions of an earthquake. This paper presents the following various tests and calculations performed in order to qualify the aseismic bearing devices: 1) one-quarter-scale test on a shake table in order to show the magnitude of the reduction of horizontal acceleration; 2) test on a scale 1 spent-fuel module in a test pool in order to evaluate the fuel rack motion damping and qualify the method used to calculate the hydrodynamic coupling masses between fuel rack and pool; and 3) nonlinear time history calculation of the fuel rack displacement during an earthquake.

15404 **Automated nuclear storage facility.** Erkkila, B.H. (Los Alamos National Lab., NM). *Transactions of the American Nuclear Society;* **53**: 156-157(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of this paper is to describe the plans and design of a medium- to long-term storage facility for source materials, special, and other nuclear materials. This project was identified by the Los Alamos National Laboratory (LANL) Long Range Planning Group as the key project in establishing a future growth policy for LANL's Special Nuclear Materials (SNM) Park. Several unique features of this facility are discussed in detail. The nuclear material storage facility will be a much needed addition to the nuclear materials complex at LANL. Construction has begun and an anticipated completion data of August 1987 is very possible. Full operation of the facility should begin by early 1988.

15405 (IAEA-TECDOC—378, pp 75-84) **Possible short and long term evolution in the cost of PWRs nuclear fuel and coal.** Baumier, J. (CEA, 75 - Paris, France. Dept. des Programmes). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

Cost evolution is a problem which keeps coming up whenever there is discussion about an energy policy. This paper identifies the causes of the charges of the past in order to give a better understanding of the costs of nuclear fuels and examines the reliability of the present forecasts. For this purpose the French case is used as an example. The conclusion is as follows: The cost of the nuclear fuel cycle should remain at about 6 centimes/kWh in con-

stant francs as they were on 1.1.84, if the price of uranium does not increase by more than 2% per annum, since an increase in this item is more than balanced by the anticipated fall in the enrichment and reprocessing costs after amortization of the relevant plants. In fact, the main parameter is the price of coal. If it remains constant, the competitiveness of nuclear fuel will not decline but will, on the contrary, increase appreciably, even given a moderate rise in coal price. 2 refs, 3 figs, 6 tabs.

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

This paper is a schematic description of the following: 1) Nuclear power in developing countries; 2) The world-wide nuclear situation; 3) The developing countries nuclear situation; 4) The situation in selected countries; 5) Future prospects; 6) Basic approach for developing countries; 7) Results of the NEA nuclear fuel economics study; 8) The uranium production situation; 9) The uranium price fluctuation. In addition hereto the paper contains an appendix concerning the Canadian nuclear status and experience. Tabs and figs.

0520 Waste Management

REFER ALSO TO CITATION(S) 15487, 15488, 15538, 15539, 15540, 15541, 15560, 15561, 15562, 15852, 16066, 16160, 16237, 16263, 16275, 16350, 16356, 16358, 16406, 16458, 16918, 16919, 16920, 16921, 16924, 16925, 17654

15407 (BMI/ONWI—629) **Alternative methods to manage waste salt from repository excavation in the Deaf Smith County and Swisher County locations, Texas: A scoping study: Technical report.** (NUS Corp., Gaithersburg, MD (USA); Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Jan 1987. 63p. NTIS, PC A04/MF A01. File Number DE87005194.

This report describes and qualitatively evaluates eight options for managing the large volumes of salt and salt-laden rock that would result from the excavation of a high-level radioactive waste repository in Deaf Smith County or Swisher County, Texas. The options are: distribution for commercial use; ocean disposal; deep-well injection; disposal in multilevel mines on the site; disposal in abandoned salt mines off the site; disposal off the site in abandoned mines developed for minerals other than salt; disposal in excavated landfills; and surface disposal on alkali flats. The main features of each option are described, as well as the associated environmental and economic impacts, and regulatory constraints. The options are evaluated in terms of 11 factors that jointly constitute a test of relative suitability. The results of the evaluation and implications for further study are indicated. This document does not consider or include the actual numbers, findings, or conclusions contained in the final Deaf Smith County Environmental Assessment (DOE, 1986). 43 refs., 8 tabs.

15408 (BNL-NUREG—39007) **Release of organic chelating agents from solidified decontamination wastes.** Piciulo, P.L.; Adams, J.W.; Milian, L.W. (Brookhaven National Lab., Upton, NY (USA); Nuclear Regulatory Commission, Washington, DC (USA)). 1986. Contract AC02-76CH00016. 11p. (CONF-860905—28). NTIS, PC A02/MF A01. File Number TI87004171.

From International meeting on low, intermediate and high level waste management - decontamination and decommissioning; Niagara Falls, NY, USA (14 Sep 1986).

In order to provide technical information needed by the US Nuclear Regulatory Commission to evaluate the adequacy of near-surface disposal of decontamination wastes, Brookhaven National Laboratory has measured the release of organic complexing agents from simulated decontamination resin wastes solidified in cement and vinyl ester-styrene. The simulated waste consisted of either mixed bed ion-exchange resins or anion exchange resins equilibrated with EDTA, oxalic acid, citric acid, picolinic acid, formic acid, simulated LOMI reagent or the LND-101A decontamination reagent. The standard procedure ANS 16.1 appeared to be adequate for determining a leachability index for organic acids for comparing the leach resistance of decontamination waste forms. Leachability indexes appeared to be specific for each organic acid. Further, the apparent diffusivities were generally less than those observed for Cs releases from cement wastes forms. The finder material and the composition of the simulated wastes affected the release of the reagents.

15409 (CEA-CONF—8406) **Test unit for measurement of small masses of alpha wastes.** Praca, C.; Labarre, S.; Ainardi, A.; Schneider, M.; Moussin, C. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 92 - Montrouge (France)). Mar 1986. 18p. (In French). (CONF-8603159—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750440.

From Meeting on protection, handling, detection and safety; Grenoble, France (12 Mar 1986).

New standards for waste surface storage require permanent management of fissile materials, even minute amounts, and accurate measurement of waste production. An accurate original system using gamma spectrometry is described in this article. It includes a lead shielded cell, a INa collimated sensor with direct counting including the peaks of Pu 239 and Pu 241 in the 400 keV range and data processing and recording. For a light matrix (cellulose or vinyl) sensitivity is 20 mg and accuracy +-25% and for a heavy matrix (graphite) 30 mg +-40%.

15410 (CEA-CONF—8487) **Tritium management in PWR fuel reprocessing plants.** Goumondy, J.P. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Apr 1986. 21p. (In French). (CONF-8604266—2). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750556.

From Tritium meeting; Dijon, France (23 Apr 1986).

Activity, quantity and nature of tritium compounds obtained during head end process (cutting and dissolution) are determined to estimate environmental release hazards in fuel reprocessing plants. Measurements on representative PWR reactor fuels (burnup 33,000 $MWdt^{-1}$, specific power 30 MW dt^{-1}) show that about 60% of the tritium produced in the reactor diffuses in the cladding where it is fixed. Remaining tritium stays in the irradiated oxide and is found as tritiated water in the solution obtained during fuel dissolution. In the UP3 plant at La Hague (France) tritiated water is disposed into the sea without environmental problems. In the case of a reprocessing plant far from the sea, the PUREX process is slightly modified for concentration of tritium in a limited amount of water (TRILEX process). It is verified experimentally in $\alpha\beta\gamma$ lab on actual fuel and by simulation at the pilot seale that the supplementary step "tritium washing" of the solvent can be obtained in pulsed columns. 4 tables, 7 figs.

15411 (CEA-CONF—8506) **Low and medium level liquid waste processing at the new La Hague reprocessing plant.** Alexandre, D. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). May 1986. 19p. (In French). (CONF-8605205—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750558.

From Colloquium on hydrology and radiology; Limoges, France (21 May 1986).

Reprocessing of spent nuclear fuels produces low- and medium-activity liquid wastes. These radioactive wastes are decontamined before release in environment. The new effluent processing plant, which is being built at La Hague, is briefly described. Radionuclides are removed from liquid wastes by coprecipitation. The effluent is released after decantation and filtration. Insoluble sludges are conditioned in bitumen.

15412 **(CNEN-NE—6.05) Radioactive waste management in radioactive installations.** (Comissao Nacional de Energia Nuclear de Brasil, Rio de Janeiro). Nov 1985. 60p. (In Portuguese). Centro de Informacoes Nucleares, Comissao Nacional de Energia Nuclear, RJ, Brazil.

It is presented a norm to establish general criteria and basic requirements related to radioactive waste management. The norm is applied to radioactive installations subject to licensing process by Brazilian Nuclear Energy Commission-CNEN.

15413 **(CONF-861207—47) The effects of gamma radiation on groundwater chemistry and glass reaction in a saturated tuff environment.** Ebert, W.L.; Bates, J.K.; Gerding, T.J.; Van Konynenburg, R.A. (Argonne National Lab., IL (USA); Lawrence Livermore National Lab., CA (USA)). Dec 1986. Contract W-31109-ENG-38. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004872.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

The Nevada Nuclear Waste Storage Investigations project has completed a series of experiments that provide insight into groundwater chemistry and glass waste form performance in the presence of a gamma radiation field at 90°C. Results from experiments done at 1 x 10^3 and O R/hr are presented and compared to similar experiments done at 2 x 10^5 and 1 x 10^4 R/hr. The major effect of radiation is to lower the groundwater pH to a value near 6.4. The addition of glass to the system results in slightly more basic final pH, both in the presence and absence of radiation. However, there is essentially no difference in the extent of glass reaction, as measured by elemental release, as a function of dose rate or total dose, for reaction periods up to 278 days.

15414 **(CONF-870306—5) Quality assurance consideration for cement-based grout technology programs at Oak Ridge National Laboratory.** McDaniel, E.W.; Tallent, O.K.; Sams, T.L.; Delzer, D.B. (Oak Ridge National Lab., TN (USA)). Jan 1987. Contract AC05-84OR21400. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004620.

From Waste management '87; Tucson, AZ, USA (1 Mar 1987).

Oak Ridge National Laboratory has developed and is continuing to refine a method of immobilizing low-level radioactive liquid wastes by mixing them with cementitious dry-solid blends. A quality assurance program is vital to the project because Nuclear Regulatory Commission (NRC), Environmental Protection Agency (EPA) and state environmental regulations must be demonstrably met (the work must be defensible in a court of law). The end result of quality assurance (QA) is, by definition, a product of demonstrable quality. In the laboratory, this entails traceability, repeatability, and credibility. This paper describes the application of QA in grout technology development at Oak Ridge National Laboratory.

15415 **(CONF-870306—6) Cleanup operations at the Oak Ridge Gaseous Diffusion Plant contaminated metal scrapyard.** Williams, L.C. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 7p. NTIS, PC A02. File Number DE87005330.

From Waste management '87; Tucson, AZ, USA (1 Mar 1987).

Cleanup operations at the contaminated metal storage yard located at the Oak Ridge, Tennessee, Gaseous Diffusion Plant have been completed. The storage yard, in existence since the early 1970s, contained an estimated 35,000 tons of mixed-type metals spread over an area of roughly 30 acres. The overall cleanup program required removing the metal from the storage yard, sorting by specific metal types, and size reduction of specific types for future processing. This paper explains the methods and procedures used to accomplish this task.

15416 **(CONF-870306—7) How well does ORIGEN predict spent LWR [Light Water Reactor] fuel characteristics.** Mailen, J.C.; Roddy, J.W. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 18p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005338.

From Waste management '87; Tucson, AZ, USA (1 Mar 1987).

The ORIGEN computer code is widely used to estimate the radionuclide content (actinides, activation and fission products) of irradiated reactor fuel and the resultant heat generation and radiation levels associated with such fuel. These estimates are used as source terms in safety evaluations of operating reactors, for evaluation of fuel behavior and regulation of the at-reactor storage, for transportation studies, and for evaluation of the ultimate geologic storage of the fuel. Calculated values determined using several variations of ORIGEN have been compared with experimentally determined values for actual fuel for many, but not all, of the parameters desired. In most cases, the comparisons did not use the most recent ORIGEN2 program, the most recent data libraries, or currently required quality assurance (QA) procedures. Comparisons of fuel composition data with ORIGEN2 are very limited, and the only data with proper QA are currently being acquired by Battelle Pacific Northwest Laboratory. This survey summarizes the fuel data available in the open literature and, where given, the calculated values by ORIGEN. Plans for additional analyses of well-characterized reactor fuel samples to improve the validation of ORIGEN2 are discussed.

15417 **(CONF-870306—8) The Integrated Data Base program: An executive-level data base of spent fuel and radioactive waste inventories, projections, and characteristics.** Klein, J.A. (Oak Ridge National Lab., TN (USA)). Jan 1987. Contract AC05-84OR21400. 7p. NTIS, PC A02. File Number DE87005341.

From Waste management '87; Tucson, AZ, USA (1 Mar 1987).

The Integrated Data Base (IDB) is the official US Department of Energy (DOE) data base for spent fuel and radioactive waste inventories and projections. As such, it should be as convenient to utilize as is practical. Examples of summary-level tables and figures are presented, as well as more-detailed graphics describing waste-form distribution by site and line charts illustrating historical and projected volume (or mass) changes. This information is readily accessible through the annual IDB publication. Other presentation formats are also available to the DOE community through a simple request to the IDB Program.

15418 **(CONF-870306—11) Monitoring of heat and moisture migration from radioactive waste disposed in an augered shaft.** Williams, R.E.; McGrath, D.A.; Boland, J.R. (Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (USA); USDOE Nevada Operations Office, Las Vegas). 1987. Contract AC08-84NV10327. 5p. NTIS, PC A02. File Number DE87005384.

From Waste management '87; Tucson, AZ, USA (1 Mar 1987).

Soil temperature and moisture data have been collected for the past 4 years at the Greater Confinement Disposal Test (GCDT) being conducted at the Nevada Test Site. High-specific-activity radioactive waste with a thermal output of 3.4 kW was buried at a depth of 30 m in tuffaceous alluvium. Prior to waste emplacement the ambient subsurface temperature was about 17°C and the volumetric soil moisture content was 10 to 12%. Two years after waste emplacement the soil temperature exceeded 100°C and the soil moisture content dropped below 4% at a radius of approximately 3 m from the thermal waste. Drying of the soil has occurred as the high temperature radiating from the thermal sources propels water vapor from the waste zone to a zone where dew-point temperatures are reached. The temperature and moisture data will be used in combination with data from gaseous tracer release tests in predicting and appraising the long-term performance of the GCDT.

15419 **(DOE/CH/10272—1) Draft area recommendation report for the Crystalline Repository Project: Comments: Final technical report.** (Mille Lacs Band of Chippewa Indians, Onamia, MN (USA)). 16 Apr 1986. Contract FG02-86CH10272. 42p. NTIS, PC A03. File Number DE87004645.

The Mille Lacs Band conducted a review of the draft area recommendation report (ARR) and provided comments as outlined in the contract. It also had staff attending the necessary training and informational meeting established by the Department of

Energy. This had met all the necessary objectives as outlined in the contract.

15420 (DOE/CH/10276—1) Crystalline Repository Project: Review and comment of the Leech Lake Reservation Business Committee: Draft area recommendation report. (Leech Lake Reservation Business Committee, Cass Lake, MN (USA)). Sep 1986. Contract FG02-86CH10276. 13p. NTIS, PC A02. File Number DE87004324.

The Leech Lake Reservation Business Committee (LLRBC) has reviewed five documents related to the US Department of Energy's Crystalline Repository Project (CRP). They are the "National Survey of Crystalline Rocks," "General Guidelines for the Recommendation of Sites for the Nuclear Waste Repositories;' Final Siting Guidelines (10 CFR Part 960)," "Regional Characterization Reports for the North Central Region," the "Region to Area Screening Methodology Document" (SMD) and the "Draft Area Recommendation Report" (DARR). The comments and discussions of issues contained in this review will be considered in the preparation of the Final Area Recommendation Report, which will formally identify potentially acceptable sites for a second national repository for the permanent disposal of high level nuclear waste. Following a review of the above referenced documents, the LLRBC has concluded that the identification of potentially acceptable sites in the Draft Area Recommendation Report is based upon inferior and incomplete technical information being applied to a flawed screening process which, among other deficiencies, pays little attention to the importance of hydrological factors in the siting process. Although the DOE prefers that comments from states and tribes be directed at the Draft Area Recommendation Report alone, the Leech Lake Reservation Business Committee is extremely concerned about inadequacies in the "National Survey of Crystalline Rocks" (ORCD-1), which serves as the foundation for all siting work done to date. The national survey was conducted utilizing little of the time or staffing required for this important phase of the Crystalline Repository Program. As a result, the national survey is based upon out-of-date scientific literature, exaggerates certain screening variables that favor the selection of regions in the eastern US and arbitrarily eliminated the few western crystalline rock bodies that passed the questionable screening process utilized.

15421 (DOE/CH/10282—1) Technical review of US Department of Energy draft area recommendation report for the crystalline repository project. (Foth and Van Dyke and Associates, Inc., Green Bay, WI (USA). Waste/Energy Div.). Apr 1986. Contract FG02-86CH10282. 86p. NTIS, PC A05. File Number DE87004325.

Foth and Van Dyke and Associates Inc. was retained by the Stockbridge-Munsee Community to evaluate the DOE's screening process for selection of candidate areas in crystalline rock terranes, and critically review the geologic and environmental factors utilized by the DOE in selecting the NC-3 area as a potentially acceptable site (PAS). We have reviewed the DOE's Draft Area Recommendation Report (ARR) issued in January 1986, and prepared our comments. In addition, geologic and environmental data pertaining to the Stockbridge-Munsee community and vicinity that was not included in the Draft ARR is presented. 24 refs., 7 figs., 4 tabs.

15422 (DOE/ID/12514—T1) Site characterization field manual for near surface geologic disposal of low-level radioactive waste. McCray, J.G.; Nowatzki, E.A. (Arizona Univ., Tucson (USA)). 31 Dec 1985. Contract FG07-84ID12514. 336p. NTIS, PC A15/MF A01; 1; GPO Dep. File Number DE87005349.

This field manual has been developed to aid states and regions to do a detailed characterization of a proposed near-surface low-level waste disposal site. The field manual is directed at planners, staff personnel and experts in one discipline to acquaint them with the requirements of other disciplines involved in site characterization. While it can provide a good review, it is not designed to tell experts how to do their job within their own discipline.

15423 (DOE/OR/00033—T251) Nuclear engineering, health physics, and radioactive waste management fellowship program: Summary of program activities: Radioactive waste management fellowship, 1985-1986. (Oak Ridge Associated Universities, Inc., TN (USA)). 1986. Contract AC05-76OR00033. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004590.

This report summarizes the 1985-86 activities of the radioactive waste management element of the US Department of Energy (DOE) Nuclear Engineering, Health Physics, and Radioactive Waste Management Fellowship program. Throughout the past year the fellowship program continued to assist DOE in meeting its expected manpower demands for trained scientists and engineers needed for the implementation of the 1982 Nuclear Waste Policy Act. A general shortage of master's and doctoral level scientists and engineers in disciplines supportive of the nation's high-level radioactive waste management may impede the Department of Energy's ability to properly carry out its mission in these areas. In addition, the underutilization of related graduate programs may have a long-term detrimental effect on this mission. The fellowship program is designed to send a signal of support for graduate programs with research and curriculum related to the management of high-level waste (HLW). It is expected that this support will encourage talented graduate students to enter the HLW graduate programs and the universities will be motivated to support and improve on their existing programs.

15424 (DOE/OR/00033—T254) Historically Black Colleges and Universities Radioactive Waste Management Research Program: Summary of activities, 1985-1986. (Oak Ridge Associated Universities, Inc., TN (USA)). 1986. Contract AC05-76OR00033. 38p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004878.

This report summarizes the 1985 to 1986 activities of the Historically Black Colleges and Universities (HBCUs) Radioactive Waste Management Research Program sponsored by the Office of Civilian Radioactive Waste Management of the US Department of Energy (DOE). The first set of three awards was made in September,1984. In September, 1985, two of these projects were renewed and a new proposal was funded. The program has been enthusiastically received by the community of HBCUs and the program sponsor.

15425 (DPST—85-547) Off-gas chemistry study of melter feed by Springborn Laboratories. Crow, K.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 5 Jun 1985. Contract AC09-76SR00001. 133p. NTIS, PC A07. File Number DE87004516.

The purpose of the off-gas chemistry study of melter feed samples was to support and help substantiate glass melter thermochemistry models developed for the DWPF. Both sludge-only and sludge-precipitate feed samples were analyzed. Each slurry sample was pyrolyzed at temperatures from 150 to 1000°C in air and inert atmospheres, and the head space products were analyzed by chromatographic and mass spectrometric methods. Thermogravimetric, differential scanning calorimetric and Fourier transform infrared analyses were also performed on each sample. There were no unusually high exothermic reactions that would be cause for concern in the DWPF melter. Results for two types of sludge-precipitate feed were compared. One type contained simulated precipitate hydrolysis aqueous (PHA) product as fed to the SCM-2 melter. The second type contained PHA from the lab-scale acid hydrolysis reactor in 677-T. A major difference between the two types was a small, but distinct, presence of higher aromatics in gas from feed with reactor-produced PHA. This feed also evolved more CO and CO_2 than feed with simulated PHA at high pyrolytic temperatures (>750°C). Recent analyses have identified the higher boiling aromatics in reactor-produced PHA as primarily diphenylamine and p-terphenyl. These compounds will be included in future PHA simulations that are fed to research melters. Under an inert atmosphere, benzene and phenol were the two most abundant organics evolved during pyrolysis of sludge-precipitate feed.

15426 **(EUR—10293) Processing of miscellaneous radioactive effluents by continuous flocculation decantation.** Lundy, D.; Matton, P.; Petteau, J.L.; Roofthooft, R. (Commission of the European Communities, Luxembourg). 1985. 154p. (In French). NTIS (US Sales Only), PC A08/MF A01. File Number DE87750553.

In the nuclear power plant of Chooz an installation for flocculation and chemical precipitation has been built to treat miscellaneous radioactive effluents continuously. It is an industrial prototype of 5 m^3/h resulting of several years of research, first on lab scale in a discontinuous system and finally in a continuous pilot plant of small size (500 l/h). The process is based on the adsorption of radioactivity on a floc of copper-ferrocyanide precipitated by ferric chloride. The water is then filtered. After a series of preliminary tests and modifications, it has been possible to develop a technique which satisfies the specified decontamination conditions and to reduce the discharges of radioactivity to the Meuse to only 5 - 10% of the authorized limits. The process aims principally at the treatment of laundry waste, but other effluents such as drains from the rocks, pool water and used decontamination solutions (of the primary pumps) have been treated. A technico-economic evaluation of the process in comparison with evaporation is clearly in favour of the flocculation. 31 figs, 40 tables, 12 refs.

15427 **(EUR—10382) Decontamination of some liquid wastes of medium activity with a new solvent type.** Gasparini, G. (Commission of the European Communities, Luxembourg). 1986. 171p. (In Italian). NTIS (US Sales Only), PC A08/MF A01. File Number DE87750545.

The decontamination of a reference MAWsub(s) (an alkaline solution coming from the solvent washing and an acidic solution consisting of the mixture of aqueous raffinates deriving from uranium and plutonium purification cycles) by hydroxamic acid is reported. The results of the "in batch" decontamination tests, using extraction chromatography techniques, are given. The extraction chromatography techniques do not give the expected performances for the tests in column. Discontinuous liquid extraction tests using traced solutions show that Pu, Am, Zr, Nb are extracted but not U and Ru. The strip of Pu, Am and Zr with an oxalic acid solution is quantitative. Continuous tests using mixer settler batteries, and a simulated alkaline solution and complete extraction-reextraction runs using a simulated solution are conducted. The results of a discontinuous conclusive experiments using a true alkaline solution coming from a reprocessing plant are given.

15428 **(EUR—10411) High-temperature incineration of radioactive waste. Exploitation of the FLK-60 slagging incinerator for the treatment of different waste streams contaminated with plutonium.** Voorde Van de, N.; Taeymans, A.; Hennart, D.; Vanbrabant, R.; Balleux, W.; Geenen, G.; Gijbels, J. (Commission of the European Communities, Luxembourg). 1986. 70p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87750546.

During the years 1983 and 1984 the FLK-60 high-temperature slagging incinerator at Mol was used for incineration of simulated plutonium waste and BWR power-station waste after extensive technical adaptations. A total of 10 tons of simulated waste containing 15 g of plutonium and 6 tons of simulated waste containing 624 MBq of ^{60}Co and 393 MBq of cesium isotopes was successfully treated. The average volume reduction factor was 18. Global decontamination factors of 280,000 for ^{137}Cs and 22,000,000 for ^{239}Pu were measured. Routine working and interventions for maintenance and repair could be carried out safely in alpha-conditions. The report describes in detail the technical adaptations and the behaviour of the various parts of the installation during the 39 runs carried out in the contract period. It also gives the chemical and radiochemical composition of the granules and secondary waste streams. The plutonium-based leach rate of the granules is in the range of 2×10^{-5} to 3.5×10^{-4} g/cm^2. d. Finally typical mass, energy and radioactivity balances of the installation are given and various options for the final conditioning of the granules are briefly discussed. 6 refs, 6 figs, 29 tables.

15429 **(EUR—10491) Experimental study of the recovery of plutonium from non-combustible wastes.** Chamberlain, H.E.; Dalton, J.T.; Dawson, R.K.; Gaudie, S.C.; Turner, A.D.; Wilkins, J.D. (Commission of the European Communities, Luxembourg). 1986. 128p. NTIS (US Sales Only), PC A07/MF A01. File Number DE87750555.

Removal of loose PuO_2 from non-combustible plutonium contaminated waste by Arklone (1,1,2-trichloro,1,2,2-trifluoro ethane) has been demonstrated on a laboratory scale. While aqueous-containing media are generally more effective decontaminants, Arklone has the advantages of being non-moderating and easily recycled by distillation. Although low-pressure spraying and vibrocleaning are effective contacting methods, ultrasonics gave the highest DF's- reducing residual Pu levels to 1-10 $\mu g/cm^2$. Lower levels are unattainable in a simple batch process due to redeposition of particulates in small surface flaws. More agressive processes are needed to achieve further decontamination. Microscopic smoothness has been identified as the most significant parameter in determining PuO_2 retention and subsequent ease of decontamination. To maintain this, radiation resitance is important, as also is surface hardness under abrasive conditions. For facility walls and ceilings, therefore, electropolished stainless steel, 316L or PEEK foil-faced GRP, and epoxy paint (with fine TiO_2) are recommended to reduce residual PuO_2 to <1 $\mu g/cm^2$ after ultrasonic washing, while work-hardened polish rolled stainless steel and bright nickel or chrome electroplates are suggested to achieve similar levels on the floor. 10 tables, 50 figs, 6 refs.

15430 **(NTB—85-01) Exploratory borehole Boettstein: Investigation report. Text volume.** Thury, M. (Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland)). Jun 1985. 190p. (In German). Nagra, Ch-5401 Baden, Switzerland.

Nagra, the National Cooperative for the Storage of Radioactive Waste, is carrying out a comprehensive geological research programme in northern Switzerland. This study, begun in 1980, will provide the scientific knowledge required to judge the suitability of the subsurface bedrock for the final storage of nuclear waste. The Boettstein well was the first borehole on the drilling programme. Its total depth is 1501 m. The present report is an extensive synopsis of the most important results achieved. It also contains comments on the methodology applied. The detailed reporting on the individual investigations is contained in the technical reports of Nagra. At present, 10 reports dealing with the Boettstein well have been published in this series, and further reports are in preparation.

15431 **(NTB—85-12) Exploratory borehole Boettstein: Construction and environmental aspects, drilling techniques.** (Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland)). Feb 1985. 128p. (In German). Nagra, Ch-5401 Baden, Switzerland.

The exploration well at Boettstein was realized as the first well within the Nagra Deep Drilling Program in Northern Switzerland. The drilling work was started October 11, 1982. Having reached the final depth of 1501.3 m on June 5, 1983, the test phase was initiated and completed by January 26, 1984. The well drilled approx. 315 m of sediments and approx. 1285 m of crystalline rock. Oriented cores were taken nearly over the whole length of the well. The present report presents the drilling activities, civil construction work related to the site and precautions taken to account for environmental protection aspects. A chapter dealing with the commission representing members of the federal, cantonal and local authorities and about reporting is given at the end of this report.

15432 **(NTB—85-24) Shrinkage experiments on bentonite samples.** Bucher, F.; Jedelhauser, P.; Jeger, P. (Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland)). Jan 1985. 18p. (In German). Nagra, Ch-5401 Baden, Switzerland.

Like other cohesive soils, bentonite exhibit shrinkage effects, i.e. when a wet sample is dried out the sample volume decreases even below the saturation limit; this can lead to crack and therefore to a decrease in heattransport through the material. The shrinkage of samples of the bentonites MX-80 and Montigel identified by Nagra as potential backfill materials has been investigated. For this

purpose the amount of shrinkage has been determined on uniaxially and isostatically compacted samples under conditions close to those expected in a repository as well as on samples initially at the liquid limit. The shrinkage limit is at a water of about 14%, resp. 18%, the shrinkage s/sup '/ expressed as a fraction of total sample volume amounts to about 9% for MX-80 and to 11% for Montigel Pulver, as determined for samples initially at the liquid limit. The shrinkage s/sup '/ of the compacted samples with water content w when shrinkage begins between 6% and 12% and corresponding dry density rho/sub d/ between 1.5 Mg/m/sup 3/ and 2.0 Mg/m/sup 3/ follows the equation s/sup '/ = s w rho/sub d/ / rho/sub w/ where the value of s, as determined experimentally, is s = (36 +- 4)%.

15433 **(NTB—85-25) Long-term stability of bentonite under repository conditions.** Mueller-Vonmoos, M.; Kahr, G. (Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland)). Mar 1985. 41p. (In German). Nagra, Ch-5401 Baden, Switzerland.

In order to assess the long-term stability of bentonite under repository conditions, five metabentonite samples from Kinnekulle (Sweden) and one sample of illite from the Massif Central (France) have been studied. It could be shown that the layer surface charge of montmorillonite increased only by a relatively small amount in the course of the transformation into metabentonite; furthermore the final product was not illite, but smectite/illite mixedlayers. The potassium content of the sample expressed as a fraction of the total ion exchange capacity decreased from 72% at the edge of the 180 cm wide bed of metabentonite to 54% in the centre, i.e. potassium had not fully exchanged aven after 450 million years. From the cation exchange capacity of the mixed layers and from the X-ray and thermoanalytical investigations by means of mass spectrometry, it can be concluded that the proportion of closed layers increases on going from the centre to the edge of the bed, particularly in the outer 10 cm. The innercrystalline swelling capability was essentially maintained, as shown by tests on a sample consisting of a mixture of all samples investigated. It may be assumed that the influence of temperature will be less in the repository than during the formation of the Kinnekulle bed. Conservative calculations show that the transformation of the bentonite into the potassium form will take more than 10/sup 6/ years. The results of the investigations carried out show that this transformation will probably be considerably slower.

15434 **(NTB—85-29) Hydrogeological basis for the modelling area Oberbauenstock.** Resele, G.; Tripet, J.P. (Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland)). Apr 1985. 70p. (In German). Nagra, Ch-5401 Baden, Switzerland.

For the project 'Gewaehr 1985', the data concerning the hydraulic parameters of the host rock (valanginian marls) in the modelling area of Oberbauenstock have been reviewed and processed; the hydraulic conductivities, in particular, have been estimated. The corresponding results are shown in the present report. According to the field observations, the 'compact' rock ('rock matrix') is practically impervious and the deep ground water flows in a network of interconnected discontinuities. The valanginian marls show three joint systems of significance for ground water flow. The geometry of these systems is defined in the present report: in particular, it is shown that the joints are closely interconnected. The hydraulic conductivity of the discontinuities is estimated to be K/sub F/ = 3.10/sup -9/ m/s, the large-scale host rock conductivity K/sub 0/ = 10/sup -1/0 m/s, with an anisotropy significantly below 10 : 1. In the vicinity of the existing or possible underground structures as tunnels and caverns, a decompressed zone is produced, whose significance for the hydraulic parameters of the host rock is shown. Observations made on the water inflow from the valanginian marls into the Seelisberg Tunnel have been processed and the seepage rate found to be very limited. The local manifestations of humidity or of drips are well correlated with certain elements of the geological structure and in particular with the thickness of the valanginian marls above the tunnel.

15435 **(NUREG—1199) Standard format and content of a license application for a low-level radioactive waste disposal facility: Safety analysis report.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Material Safety and Safeguards). Jan 1987. 106p. NTIS, PC A06/MF A01 - GPO. File Number TI87900510.

This document discusses the information that should be provided in the Safety Analysis Report and establishes a uniform format for presenting the information necessary to fulfill the licensing requirements for land disposal of radioactive waste called for in 10 CFR 61. The uniform format will (1) help ensure that the Safety Analysis Report contains the information required by 10 CFR 61, (2) aid the applicant and NRC staff in ensuring that the information is complete, (3) help persons reading the Safety Analysis Report to locate information, and (4) contribute to shortening the time needed for the review process.

15436 **(NUREG—1200) Standard review plan for the review of a license application for a low-level radioactive waste disposal facility: Safety analysis report.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Material Safety and Safeguards). Jan 1987. 468p. NTIS, PC A20/MF A01 - GPO. File Number TI87900511.

The Standard Review Plan (SRP) (NUREG-1200) provides guidance to staff reviewers in the Office of Nuclear Material Safety and Safeguards who perform safety reviews of applications to construct and operate low-level radioactive waste disposal facilities. The SRP ensures the quality and uniformity of the staff reviews and presents a well-defined base from which to evaluate proposed changes in the scope and requirements of the staff reviews. The SRP makes information about the regulatory licensing process widely available and serves to improve the understanding of the staff's review process by interested members of the public and the nuclear power industry. Each individual SRP addresses the responsibilities of persons performing the review, the matters that are reviewed, the Commission's regulations and acceptance criteria necessary for the review, how the review is accomplished, the conclusions that are appropriate, and the implementation requirements.

15437 (NUREG/CP—0079, pp 131-184) **Fluid flow in a fractured rock mass.** Klavetter, E.A.; Peters, R.R. (Sandia National Labs., Albuquerque, NM). Aug 1986. NTIS, PC A25/MF A01 - GPO. File Number TI87002232. (PNL-SA—13796; CONF-8505180—). Contract AC04-76DP00789.

From Symposium on groundwater flow and transport modeling for performance assessment of deep geologic disposal of radioactive waste; Albuquerque, NM, USA (20 May 1985).

The geological formations in the unsaturated zone underlying Yucca Mountain, on and adjacent to the Nevada Test Site, are being evaluated by the Nevada Nuclear Waste Storage Investigations project. The formations are being considered as host media for a radioactive-waste repository. They are composed of tuffaceous materials, sometimes highly fractured, whose hydrologic properties must be evaluated to estimate the rate at which radionuclides could migrate to the accessible environment. Hydrologic flow models used for postclosure performance assessment of the prospective repository must take into account the potential for water movement in both the rock matrix and the fractures. Calculations using models that explicitly account for the effects of individual fractures are not feasible, because of the extremely large number of fractures contained in a site-scale problem and the difficulties in characterizing and modeling the fracture geometries. Comparisons of properties calculated by both approaches were found to yield qualitatively and quantitatively similar results.

15438 (NUREG/CP—0079, pp 188-229) **Effect of percolation rate on water-travel time in deep, partially saturated zones.** Peters, R.R.; Gauthier, J.H.; Dudley, A.L. (Sandia National Labs., Albuquerque, NM). Aug 1986. NTIS, PC A25/MF A01 - GPO. File Number TI87002232. (PNL-SA—13796; CONF-8505180—). Contract AC04-76DP00789.

From Symposium on groundwater flow and transport modeling for performance assessment of deep geologic disposal of radioactive waste; Albuquerque, NM, USA (20 May 1985).

The Nevada Nuclear Waste Storage Investigations (NNWSI) project is investigating Yucca Mountain, Nye County, Nevada, as a prospective site for a radioactive-waste repository. The Yucca Mountain site is unique among those currently being investigated by the US Department of Energy (DOE) in that the prospective repository location is in the unsaturated zone, approximately 300 m above the water table. A composite-porosity, continuum model was developed to model flow in a fractured, porous medium. Simulations using data from the Yucca Mountain site and this model in the one-dimensional code TOSPAC indicate that current estimates of the percolation rate result in water movement confined to the matrix and that the water-travel time from the repository to the water table in on the order of hundreds of thousands of years. This result is sensitive to the percolation rate; an increase in percolation rate of a factor of 10 may initiate water movement in the fractures, reducing the travel time significantly.

15439 (NUREG/CR—4730) **Evaluation of potential mixed wastes containing lead, chromium, used oil, or organic liquids.** Siskind, B.; MacKenzie, D.R.; Bowerman, B.S.; Kempf, C.R.; Piciulo, P.L. (Brookhaven National Lab., Upton, NY (USA); Nuclear Regulatory Commission, Washington, DC (USA). Div. of Waste Management). Jan 1987. Contract AC02-76CH00016. 172p. (BNL-NUREG—52019). NTIS MF A01- GPO. File Number TI87005636.

This report presents the results of follow-on studies conducted by Brookhaven National Laboratory (BNL) for the Nuclear Regulatory Commission (NRC) on certain kinds of low-level waste (LLW) which could also be classified as hazardous waste subject to regulation by the Environmental Protection Agency (EPA). Such LLW is termed "mixed waste." Additional data have been collected and evaluated on two categories of potential mixed waste, namely LLW containing metallic lead and LLW containing chromium. Additionally, LLW with organic liquids, especially liquid scintillation wastes, are reviewed. In light of a proposed EPA rule to list used oil as hazardous waste, the potential mixed waste hazard of used oil contaminated with radionuclides is discussed. It is concluded that the EPA test for determining whether a solid waste exhibits the hazardous characteristic of extraction procedure toxicity does not adequately simulate the burial environment at LLW disposal sites, and in particular, does not adequately assess the potential for dissolution and transport of buried metallic lead. Also, it is found that although chromates are, in general, not a normal or routine constituent in commercial LLW, light water reactors which do use chromates might find it beneficial to consider alternative corrosion inhibitors. In addition, it is noted that if used oil is listed by the EPA as hazardous waste, LLW oil may be managed by a scheme including one or more of the following processes: incineration, immobilization, sorption, aqueous extraction and glass furnace processing. 59 refs., 22 figs., 37 tabs.

15440 (NUREG/CR—4737) **Interpretative analysis of data for solute transport in the unsaturated zone.** Fuentes, H.R.; Polzer, W.L. (Los Alamos National Lab., NM (USA); Nuclear Regulatory Commission, Washington, DC (USA). Div. of Waste Management). Jan 1987. Contract W-7405-ENG-36. 240p. (LA—10817-MS). NTIS, PC A11/MF A01 - GPO. File Number TI87004848.

In this report, the movement of iodide, bromide, and lithium under unsaturated flow conditions is modeled using the computer code CFITIM. This code is a solution of the one-dimensional convective-dispersive equation when steady-state flow exists and when interactions between the solute and Bandelier tuff can be described by the linear isotherm. The model predicts well the transport of the solutes iodide, bromide, and lithium when flow conditions are near steady-state. When assuming average steady-state flow conditions, the model predicts dispersion factors for unsteady flow within one to two orders of magnitude of the predictions at steady-state flow; retardation factors, on the other hand, are predicted much better than the dispersion factors. Differences in the estimated dispersion coefficients for solutes of two steady-state pulses indicate that the intended replication of those steady-state flow pulses was not achieved during experimentation. A comparison of breakthrough curves of solutes from one depth to another in the 3-m x 6-m field experimental caisson indicates poor conservation of solute mass during transport.

15441 (ORNL/TM—10226) **Americium product solidification and disposal.** Mailen, J.C.; Campbell, D.O.; Bell, J.T.; Collins, E.D. (Oak Ridge National Lab., TN (USA)). Jan 1987. Contract AC05-84OR21400. 37p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005271.

The americium product from the TRUEX processing plant needs to be converted into a form suitable for ultimate disposal. An evaluation of the disposal based on safety, number of process steps, demonstrated operability of the processes, production of low-level alpha waste streams, and simplicity of maintenance with low radiation exposures to personnel during maintenance, has been made. The best process is to load the americium on a cation exchange resin followed by calcination or oxidation of the resin after loading.

15442 (PNL—5750-Pt.5, pp 31-33) **Technical assistance to Department of Energy/Office of Operational Safety Assurance Program for remedial action.** Denham, D.H.; Cross, F.T.; Kennedy, W.E. Jr.; Marks, S.; Soldat, J.K.; Stenner, R.D. Feb 1986. NTIS, PC A04/MF A01. File Number DE86011909.

In Pacific Northwest Laboratory annual report for 1985 to the DOE Office of the Assistant Secretary for Environment, Safety and Health. Part 5. Overview and assessment.

This project was initiated in FY 1984 to provide technical assistance to the Department of Energy (DOE), Office of Operational Safety (OOS) in developing and implementing its Assurance Program for Remedial Action (APRA), i.e., overview of the DOE remedial action programs. During this second year of the project,* the technical assistance included report and procedure reviews, and assistance with conducting the Uranium Mill Tailings Remedial Action Program (UMTRAP) Office (DOE/AL) appraisal. This included participation in preappraisal visits to UMTRAP sites in Canonsburg, Pennsylvania; Grand Junction, Colorado; and Salt Lake City, Utah. Pacific Northwest Laboratory (PNL) also transferred the PNL-developed document review software to the Oak Ridge Associated Universities (ORAU) staff in Grand Junction, Colorado, in anticipation of future document reviews by the ORAU staff. Other accomplishments have included publication of two formal documents and three project reports, preparation and presentation of five topical reports at national and international meetings, two foreign trip reports, and comments on proposed draft standards of the Environmental Protection Agency (40 CFR 193). The project manager has also participated on National Council on Radiation Protection and Measurements (NCRP) and American Society for Testing and Materials (ASTM) subcommittees developing decommissioning standards, as well as International Atomic Energy Agency (IAEA) advisory groups developing environmental monitoring guidelines.

15443 (PNL—5750-Pt.5, pp 35-37) **Environmental protection support and assistance.** Kennedy, W.E. Jr.; Corley, J.P.; McLaughlin, T.J.; Jaquish, R.E.; Hawley, K.A.; Washburn, D.K.; Peloquin, R.A.; Stenner, R.D.; Van Houten, N.C.; Adams, R.C.; Imhoff, K.L. Feb 1986. NTIS, PC A04/MF A01. File Number DE86011909.

In Pacific Northwest Laboratory annual report for 1985 to the DOE Office of the Assistant Secretary for Environment, Safety and Health. Part 5. Overview and assessment.

The Pacific Northwest Laboratory (PNL) continued to provide technical assistance to the Department of Energy (DOE) Office of Operational Safety (OOS) in the area of environmental protection. PNL's technical assistance included development of revised DOE guidance for estimating population doses from exposure to radioactive materials, preparation of the annual DOE environmental summary, initial development of a standardized environmental protection information system, and development of a draft budgetary priority ranking method for identified ES & H upgrade projects. As part of the PNL ad hoc efforts, an independent evaluation was provided to OOS of the potential radiation doses to the public for the historical (1953-1984) uranium effluents to air and water resulting from operations at the Feed Materials Production Center (FMPC) located near Fernald, Ohio. PNL also supported OOS by providing extensive planning, local arrangements, and coordination of the published proceedings for the Fifth DOE Environmental Protection Information Meeting, which was held in Albuquerque, New Mexico November 6-8, 1984.

15444 (PNL—5750-Pt.5, pp 39-40) **Hazard waste risk assessment.** Hawley, K.A.; Napier, B.A. Feb 1986. NTIS, PC A04/MF A01. File Number DE86011909.

In Pacific Northwest Laboratory annual report for 1985 to the DOE Office of the Assistant Secretary for Environment, Safety and Health. Part 5. Overview and assessment.

Pacific Northwest Laboratory continued to provide technical assistance to the Department of Energy (DOE) Office of Operational Safety (OOS) in the area of risk assessment for hazardous and radioactive-mixed waste management. The overall objective is to provide technical assistance to OOS in developing cost-effective risk assessment tools and strategies for bringing DOE facilities into compliance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) and the Resource Conservation and Recovery Act (RCRA). Major efforts during FY 1985 included (1) completing the modification of the Environmental Protection Agency (EPA) Hazard Ranking System (HRS) and developing training manuals and courses to assist in field office implementation of the modified Hazard Ranking System (mHRS); (2) initiating the development of a system for reviewing field office HRS/mHRS evaluations for appropriate use of data and appropriate application of the methodology; (3) initiating the development of a data base management system to maintain all field office HRS/mHRS scoring sheets and to support the master OOS environmental data base system; (4) developing implementation guidance for Phase I of the DOE CERCLA Program, Installation Assessment; (5) continuing to develop an objective, scientifically based methodology for DOE management to use in establishing priorities for conducting site assessments under Phase II of the DOE CERCLA Program, Confirmation; and (6) participating in developing the DOE response to EPA on the proposed listing of three sites on the National Priorities List.

15445 (PNL—5929) **Nuclear Waste Treatment Program: Qualification of commercial high-level waste forms: Approach and status.** Brouns, R.A.; Kuhn, W.L. (Pacific Northwest Lab., Richland, WA (USA)). Dec 1986. Contract AC06-76RL01830. 30p. NTIS, PC A03/MF A01; GPO Dep. File Number DE87003354.

In this document, the Nuclear Waste Treatment Program (NWTP) proposes an approach for demonstrating compliance with acceptance specifications. The proposed approach relies first on developing models of the process (vitrification) and product (waste form) to relate measurable process variables to the product quality, and then on using process control and sampling of melter feed input as the quality control method. Coordinated test programs, using pilot-scale nonradioactive and radioactive tests, will be used to establish these models at the confidence level needed to assure compliance to waste acceptance specifications. The test programs are broadly focused to encompass the range of anticipated future wastes, but the results should also be equally applicable to current wastes as well. Demonstration of waste form compliance by some other method would likely require extensive product testing, including glass sampling during production and routine destructive examination of canisters. The process and product modeling approach eliminates the need for this type of testing and should result in a very high level of statistical confidence that the individual waste forms are acceptable for disposal.

15446 (PNL-SA—13772) **Evaluation of Synroc-C as a second generation waste form.** Shade, J.W. (Pacific Northwest Lab., Richland, WA (USA)). Oct 1986. Contract AC06-76RL01830. 8p. (CONF-860910—3). NTIS, PC A02. File Number DE87004918.

From 2. international conference on radioactive waste management; Winnipeg, Manitoba, Canada (7 Sep 1986).

Synroc-C was evaluated as a candidate second generation waste form, relative to 76-68 borosilicate glass, by leach testing both monolithic and powdered samples at 90°C and 150°C in brine and silicate solutions. Additional short-term tests were made at low surface-area-to-volume ratios between 90°C and 250°C to estimate forward-direction leach rates and activation energies. Dissolution rates of Cs, Mo, Ba, and U indicated that Synroc-C generally performed about an order of magnitude better than 76-68 glass. The release of Cs and Mo from Synroc may be from intergranular regions initially. Activation energies for these two elements from glass were about 9 kcal/mol, but were less than 3 kcal/mol from Synroc-C.

15447 (PNL-SA—14054) **Comparison of uranium release from spent fuel and unirradiated UO_2 in salt brine.** Gray, W.J. (Pacific Northwest Lab., Richland, WA (USA)). Nov 1986. Contract AC06-76RL01830. 22p. (CONF-861207—56). NTIS, PC A02/MF A01; GPO Dep. File Number DE87004923.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

Spent fuel and unirradiated UO_2 were previously reported to have exhibited a 100-fold difference in the total amount of uranium released during static leach tests in salt brine. Two additional studies designed to investigate that differences have now been completed. The first study involved leach tests with UO_2 pellets that had been doped with plutonium to simulate the alpha activity in spent fuel. The second study consisted of leach tests on spent fuel specimens that originated in the same reactor assembly as those used in previous tests but handled differently following discharge from the reactor. Results from the recently completed tests show that at least 90% of the reported difference between spent fuel and UO_2 can be attributed to an apparent surface oxidation of the spent fuel specimens after their discharge from the reactor. The effect of alpha radiolysis on the leaching of spent fuel and UO_2 in salt brine in the presence of an air atmosphere was found to be relatively small in these tests.

15448 (SAND—86-2414C) **Waste glass leaching: Chemistry and kinetics.** Bunker, B.C. (Sandia National Labs., Albuquerque, NM (USA)). 1986. Contract AC04-76DP00789. 15p. (CONF-861207—53). NTIS, PC A02/MF A01; GPO Dep. File Number DE87005059.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

Nuclear waste glass leaching has been studied extensively during the past ten years. Although much has been learned concerning the kinetics and mechanisms of glass dissolution, it does not appear that accurate predictions can yet be made concerning the release kinetics for specific elements from a given glass as a function of environmental conditions. In order to reliably predict elemental release rates, one needs to know: (1) how a given element is incorporated into the glass structure, (2) how specific sites in the glass react with water, (3) how the composition and reactivity of the leachate influence glass reactivity, (4) how the structure and reactivity of the glass changes in surface alteration layers, and (5) how glass dissolution modifies the chemistry of the leachate. At our current level of understanding, we are only able to make qualitative predictions concerning each of the above factors which allow us to make "order of magnitude" or "upper limit" predictions for radionuclide release rates.

15449 (SAND—86-7161) **Interpretation of the convergent-flow tracer tests conducted in the Culebra dolomite at the H-3 and H-4 hydropads at the Waste Isolation Pilot Plant (WIPP) site.** Kelley, V.A.; Pickens, J.F. (Intera Technologies, Inc., Austin, TX (USA); Sandia National Labs., Albuquerque, NM (USA)). Dec 1986. Contract AC04-76DP00789. 232p. NTIS, PC A11/MF A01; 1; GPO Dep. File Number DE87005212.

Tracer tests utilizing conservative organic tracers have been conducted in the Culebra Dolomite Member of the Rustler Formation at the locations of the H-2, H-3, H-4,and H-6 hydropads. The objective of this report is to present a quantitative evaluation of the physical solute-transport parameters of the Culebra dolomite at the H-3 and H-4 hydropad locations from interpretation of the tracer-test data. The tracer-test configurations consisted of a pumping well and two tracer-addition wells arranged in approximate equilateral triangles with 30-m sides. The transport of organic tracers from the tracer-addition wells to the pumping wells was analyzed using the finite-difference model SWIFT II, which is capable of simulating single- and double-porosity flow and transport. 75 refs., 17 tabs.

15450 (SAND—86-7172) Pore-water pressure events during the in situ heat transfer experiment simulation: Piezometer probe technology. Bennett, R.H.; Burns, J.T.; Li, H.; Percival, C.M.; Lipkin, J. (Naval Ocean Research and Development Activity, NSTL, MS (USA); Sandia National Labs., Albuquerque, NM (USA)). Jan 1987. Contract AC04-76DP00789. 78p. NTIS, PC A05/MF A01. File Number DE87005214.

Single sensor piezometer probes, 8mm in diameter were developed and tested for deep-ocean geotechnical investigations in support of the Subseabed Disposal Program. Two probes were tested in a hyperbaric chamber pressurized to 55 MPa (8000 psi) during a scaled (0.28: 1) simulation experiment conducted at the David Taylor Naval Ship Research and Development Center (DTNSRDC) in Annapolis, Md. Testing was performed for 30 days with the probes inserted in reconstituted illitic marine sediment. Small differential pore-water pressures were generated in response to both mechanically and thermally generated forcing functions. The piezometers sensed very small (approximately 1.7 kPa (0.25 psi)) pore water pressure events during the process of carrying out other experimental objectives. The pressure sensors exhibited excellent sensitivity and stability during other deep-ocean simulated laboratory pressure tests for periods of up to 750 hours. In addition to the measurements of ambient and dynamic pore pressure response to environmental forces, the piezometer test data can be used to derive the in situ undrained shear strengths and permeabilities of seabed sediments. The piezometer probe technology is providing a quantitative means of assessing important geotechnical parameters of fine-grained seabed deposits. 22 refs., 28 figs., 10 tabs.

15451 (UCRL—53726) Reference waste package environment report. Glassley, W.E. (Lawrence Livermore National Lab., CA (USA)). 1 Oct 1986. Contract W-7405-ENG-48. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005588.

One of three candidate repository sites for high-level radioactive waste packages is located at Yucca Mountain, Nevada, in rhyolitic tuff 700 to 1400 ft above the static water table. Calculations indicate that the package environment will experience a maximum temperature of ~230°C at 9 years after emplacement. For the next 300 years the rock within 1 m of the waste packages will remain dehydrated. Preliminary results suggest that the waste package radiation field will have very little effect on the mechanical properties of the rock. Radiolysis products will have a negligible effect on the rock even after rehydration. Unfractured specimens of repository rock show no change in hydrologic characteristics during repeated dehydration-rehydration cycles. Fractured samples with initially high permeabilities show a striking permeability decrease during dehydration-rehydration cycling, which may be due to fracture healing via deposition of silica. Rock-water interaction studies demonstrate low and benign levels of anions and most cations. The development of sorptive secondary phases such as zeolites and clays suggests that anticipated rock-water interaction may produce beneficial changes in the package environment.

15452 (UTRCN-S—8) Report of the symposium on 'total research on long life radioactive waste management' in the Research Center for Nuclear Science and Technology, Univ. of Tokyo. (Tokyo Univ. (Japan). Research Center for Nuclear Science and Technology). Nov 1984. 92p. (In Japanese). (CONF-8311300—Summs.). NTIS (US Sales Only), PC A05/MF A01. File Number DE87701241.

From Symposium on total research on long life radioactive waste management; Tokyo, Japan (25 Nov 1983).

The summaries of the lectures on "Report of Research Expert Committee of the US Science Academy on the propriety of the land disposal of high level wastes", "ICRP recommendation and safety evaluation on disposal of radioactive wastes - Long half-life nuclides such as transuranic elements", "Behavior of tritium in environment", "Research on the safety of high level wastes in the Japan Atomic Energy Research Institute", "On distribution coefficient Kd", "Hydraulic conductivity of strata related to the stratum disposal of radioactive wastes", "Biological base of the safety control of plutonium" are collected in this report. (Kako, I.).

15453 Defining greater-than-class-C low-level radioactive waste. Knecht, M.A.; Oztunali, O.I. (Idaho National Engineering Lab., Idaho Falls). *Transactions of the American Nuclear Society;* **53**: 94-95(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Low-Level Radioactive Waste Policy Amendments Act of 1985 (LLRWPAA) was signed by President Reagan on January 15, 1986. This act requires the federal government to be responsible for the disposal of greater-than-class-C low-level radioactive waste (LLRW) that is generated commercially by state agencies and by federal entities (other than waste generated by atomic weapons research, development, or testing, or by decommissioning of vessels of the nuclear navy). To plan for disposal, the federal government will require estimates of the volume of waste involved and characterization of this waste. A clear definition of greater-than-class-C LLRW is the first step in determining what wastes will be included in the waste to be received by the federal government. This definition will influence major policy decisions to be made for management of such waste. The purpose of this paper is to examine the existing information on greater-than-class-C LLRW in view of the current definition of such waste and potential changes in this definition - for example, an upper limit on the concentrations of radionuclides in LLRW. The paper identifies further information needs to develop a clear definition of such waste for use in federal planning for acceptance of responsibility for disposal of such waste.

15454 Transuranic waste disposal in the United State. Thompson, J.D. (Rockwell International, Albuquerque, NM). *Transactions of the American Nuclear Society;* **53**: 95(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The US is unique in having created a special class of radioactive waste disposal based on the concentration of transuranic (TRU) elements in the waste. Since 1970, the US has been placing newly generated TRU waste in retrievable storage. It is intended that these wastes will be placed in a permanent deep geologic repository, the Waste Isolation Pilot Plant (WIPP). The WIPP opening for a demonstration emplacement period is set for October 1988. Transuranic wastes derive from some of the manufacturing and research activities carried out by the US Department of Energy (DOE). The bulk of this waste is generated in plutonium parts fabrication activities. A variety of plutonium-contaminated materials ranging from glove boxes, high-efficiency particulate air filters, and machine tools, to chemical sludges derived from plutonium recovery streams are stored as TRU wastes. Other processes that generate TRU waste are plutonium production operations, preparation for and cleanup from fuel reprocessing, manufacturing of plutonium heat sources, and nuclear fuel cycle research activities. Extensive procedures will be used to examine and prepare waste before it is placed in the WIPP for disposal. After the WIPP opens, certified waste will be transported to it and emplaced in the repository.

15455 Evaluation of the potential for deregulated disposal of very low level wastes from nuclear power plants. Davis, J.P. *Transactions of the American Nuclear Society;* **53**: 95-96(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

At the present time essentially all low-level (radioactive) waste (LLW) from nuclear power plants may be disposed of only by transfer to a licensed disposal facility, pursuant to the requirements of US Nuclear Regulatory Commission (NRC) regulations, 10CF20 and 10CFR61. Even waste streams that contain extremely small quantities of radioactive material of plant origin or possibly contain such materials are subject to these requirements. These very low level wastes (VLW) do not pose a significant radiological risk to public health, and their treatment as Part 61 LLW may impose disproportionate or unwarranted costs on the public. The purpose of this study is to review the characteristics of LLW streams generated in nuclear power facilities to determine which may be suitable for disposal by methods other than transfer to an NRC-licensed facility and to evaluate the benefits, risks, and costs of exempting such VLW from the disposal requirements of 10CFR

parts 20 and 61. This information would be appropriate for use in support of petitions for rulemaking or exemption requests.

15456 **Criteria for waste-related risks to be below regulatory concern.** Trubatch, S.L. (Commonwealth Edison Co., Chicago, IL). *Transactions of the American Nuclear Society;* **53**: 96-97(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper describes and analyzes the criteria recently established by the US Court of Appeals for the District of Columbia Circuit for determining that a risk is de minimis, i.e., below regulatory concern (BRC), for the purpose of the Atomic Energy Act of 1954, as amended, 42 USC 2011 et seq. The court established these BRC criteria incidentally during its review of intervenors' challenge to the US Nuclear Regulatory Commission's (NRC's) issuance of an operating license for the Diablo Canyon Nuclear Power Plant. In the course of that licensing proceeding, the NRC had determined that its regulations did not require it to consider the complicating effects of earthquakes on emergency planning. Although the legal standard and its quantitation arose in the context of emergency planning, these criteria are equally applicable to waste-related risks cognizable under the Atomic Energy Act. These criteria imply that the NRC, when licensing a waste repository, need not consider the risk of a catastrophic accident having a frequency of occurrence of less than one chance in one hundred thousand per year.

15457 **Disposal of BRC wastes containing short-lived radionuclides.** Rogers, V.C.; Baird, R.D. (Rogers & Associates Engineering Corp., Salt Lake City, UT). *Transactions of the American Nuclear Society;* **53**: 97-98(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

As part of its responsibility for the safe disposal of low-level (radioactive) waste (LLW), the Texas Low-Level Radioactive Waste Disposal Authority sponsored an analysis of the use of permitted sanitary landfills for the disposal of wastes containing only low concentrations of radionuclides with half-lives of <300 days. Analyses have been performed giving limits on concentrations and total curies annually disposed for 56 short-lived radionuclides. The Low-Level Radioactive Waste Policy Amendments Act, enacted in December 1985, has directed the US Nuclear Regulatory Commission (NRC) to develop standards and procedures for considering and acting on petitions for below regulatory concern (BRC) radioactive waste disposal within 6 months. The NRC has developed a de minimis biomedical waste disposal rule for H-3 and C-14 that places limits on concentrations that can be disposed of without regard to radioactivity. Likewise, the US Environmental Protection Agency (EPA) is developing a regulation for the disposal of BRC radioactive wastes in a sanitary landfill as part of their LLW disposal rulemaking. The purpose of this study is to: 1) conduct multipathway risk assessments using the same methodology that is being used by the EPA for the technical support of their BRC rulemaking; 2) obtain radionuclide concentration and annual total curie limits from the results of the risk assessments by limiting the health impacts to guideline values used in this analysis; and 3) present other restrictions or conditions that emerge from the analysis.

15458 **Proposed classification scheme for high-level and other radioactive wastes.** Kocher, D.C.; Croff, A.G. (Oak Ridge National Lab., TN). *Transactions of the American Nuclear Society;* **53**: 98-100(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Nuclear Waste Policy Act (NWPA) of 1982 defines high-level (radioactive) waste (HLW) as (A) the highly radioactive material resulting from the reprocessing of spent nuclear fuel...that contains fission products in sufficient concentrations; and (B) other highly radioactive material that the Commission...determines...requires permanent isolation. This paper presents a generally applicable quantitative definition of HLW that addresses the description in paragraph B. The approach also results in definitions of other wastes classes, i.e., transuranic (TRU) and low-level waste (LLW). The basic waste classification scheme that results from the quantitative definitions of highly radioactive and requires permanent isolation is depicted. The concentrations of radionuclides that correspond to these two boundaries, and that may be used to classify radioactive wastes, are given.

15459 **Approach to defining de minimis, intermediate, and other classes of radioactive waste.** Cohen, J.J.; Smith, C.F. (SAIC, Pleasanton, CA). *Transactions of the American Nuclear Society;* **53**: 100-102(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This study has developed a framework within which the complete spectrum of radioactive wastes can be defined. An approach has been developed that reflects both concerns in the framework of a radioactive waste classification system. In this approach, the class of any radioactive waste stream is dependent on its degree of radioactivity and its persistence. To be consistent with conventional systems, four waste classes are defined. In increasing order of concern due to radioactivity and/or duration, these are: 1. De Minimis Wastes: This waste has such a low content of radioactive material that it can be considered essentially nonradioactive and managed according to its nonradiological characteristics. 2. Low-Level Waste (LLW): Maximum concentrations for wastes considered to be in this class are prescribed in 10CFR61 as wastes that can be disposed of by shallow land burial methods. 3. Intermediate Level Waste (ILW): This category defines a class of waste whose content exceeds class C (10CFR61) levels, yet does not pose a sufficient hazard to justify management as a high-level waste (i.e., permanent isolation by deep geologic disposal). 4. High-Level Waste: HLW poses the most serious management problem and requires the most restrictive disposal methods. It is defined in NWPA as waste derived from the reprocessing of nuclear fuel and/or as highly radioactive wastes that require permanent isolation.

15460 **Economics of disposal at future disposal facilities.** Scoville, J.J. *Transactions of the American Nuclear Society;* **53**: 110-112(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Passage of the Low-Level Waste Policy Act of 1980 clearly leaves the responsibility for the disposal of low-level (radioactive) waste (LLW) at the doorstep of the state capitol of the state of origin. Fortunately, this does not mean that the future will see each state operating its own LLW disposal facility. The provision for regional compacts specifically provides that states may work together to solve the problem of waste disposal. As is the case with many political solutions to problems, the Low-Level Waste Policy Act does not address economics nor was the cost of disposal a factor in the debate leading to ultimate passage of the act. Also, with the passage of the Low-Level Waste Policy Act Amendment of 1985, significant surcharges will be experienced by generators in regions not yet providing their own LLW disposal. The generators of these wastes are seriously asking questions as to the future costs of disposal. While a comprehensive study of future costs must await detailed disposal facility design, some estimates can be made based on the volume of waste generated in a compact region and on the conceptual design of the facility. It is the purpose of this paper to present some of these estimates for the regions that seem to be establishing fairly fixed political boundaries.

15461 **Effect of technology on the economics of low-level waste disposal.** Jones, D.F.; Brooks, E.T. *Transactions of the American Nuclear Society;* **53**: 112-113(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of this paper is to discuss the economics of establishing and operating a low-level radioactive waste (LLW) disposal site under current conditions and with the application of various technologies. Topics include: economic considerations, initial capital investment, return on investment, operating profit, disposal volume and price, and impact of advanced technologies. The business aspects of establishing and operating LLW disposal sites in the US are the changed product of a truly new era.

15462 **Modeling the economics of LLW volume reduction.** Voth, M.H.; Witzig, W.F. (Pennsylvania State Univ., University Park). *Transactions of the American Nuclear Society;* 53: 113-115(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Generators of low-level (radioactive) waste (LLW) are under pressure to implement volume reduction (VR) programs for political and economic reasons. Political reasons include the appearance of generating less waste or meeting quotas. Economic reasons include avoiding high disposal costs and associated surcharges. Volume reduction results in less total volume over which fixed disposal costs are allocated and therefore higher unit costs for disposal. As numerous small compacts are developed, this often overlooked effect becomes more pronounced. The described model presents two unique significant features. First, a feedback loop considers the impact of VR on disposal rates, and second, it appeals to logic without extensive knowledge of VR technology or computer modeling. The latter feature is especially useful in conveying information to students and nontechnical decision makers, demonstrating the impact of each of a complicated set of variables with reproducible results.

15463 **Cost effectiveness for improved methods of low-level radioactive waste disposal.** Cohen, J.J.; Pasternak, A. (SAIC, Pleasanton, CA). *Transactions of the American Nuclear Society;* 53: 115(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Concerns over the siting and operation of low-level (radioactive) waste (LLW) disposal facilities have stimulated efforts to develop improved (safer) methods for LLW management. In certain states, legislation has been proposed that would require more stringent controls for LLW disposal sites than would normally be required to assure compliance with provisions of 10CFR61. To determine the cost effectiveness of the required improvements, a cursory (generic) cost-benefit analysis has been performed. If the requirement for enhanced LLW disposal is intended primarily to obtain public confidence, then its cost effectiveness must be determined in terms of that objective. No evidence has been found of any systematic study that would indicate the effect of increasingly restrictive controls on public confidence/acceptance.

15464 **Economic considerations for nuclear power plant LLW.** Shaw, R.A. (Electric Power Research Institute, Palo Alto, CA). *Transactions of the American Nuclear Society;* 53: 115-116(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

So many factors influence the economics of the production, processing, packaging, and disposal of low-level (radioactive) wastes (LLW) at a nuclear power plant that it is necessary to consider these elements as part of the system. One of the easiest and most direct ways of reducing the costs of radioactive wastes is to reduce the source. A second technique involves the processing of the radioactive wastes. One change under consideration by the US Nuclear Regulatory Commission could have significant economic consequences on LLW for nuclear power plants. This change is the potential for identifying concentrations of radioisotopes that are below regulatory concern, and, therefore, can be disposed of as normal, everyday wastes. The conclusion is that the various elements that are a part of the whole chain of the waste disposal system from source to disposal must be considered when economic decisions are made in any one of the elements. Results are presented showing how the various elements influence total costs when considering various typical plant waste generation scenarios. In addition, the changes in the regulations and the cost structure associated with waste disposal will also significantly influence these economic decisions, as will be shown through the effect of current and near-future disposal surcharges and probably need for utility short-term on-site storage capability.

15465 **Cost effectiveness of below-threshold waste disposal at DOE sites.** Wickham, L.E.; Smith, C.F.; Cohen, J.J. (EG & G Idaho, Idaho Falls). *Transactions of the American Nuclear Society;* 53: 116(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Previous study has indicated the feasibility of establishing a threshold of concentration below which certain low-level (radioactive wastes) (LLW) could be safely handled and disposed of by conventional means such as landfills. Such below-threshold wastes have been synonymously termed de minimis or below regulatory concern (BRC) and can be deemed appropriate for management according to their nonradiological characteristics. The objective of this study was to determine the cost effectiveness for management and disposal of below-threshold waste at certain US Department of Energy sites. The sites selected for this study were the Idaho National Engineering Laboratory and Savannah River Laboratory. Cost-benefit analysis was used to determine the impacts, benefits, and potential cost advantages of establishing and implementing a threshold limit.

15466 **Radiation doses in alternative commercial high-level waste management systems.** Schneider, K.J.; Pelto, P.J.; Lavender, J.C.; Daling, P.M.; Fecht, B.A. (Pacific Northwest Lab., Richland, WA). *Transactions of the American Nuclear Society;* 53: 121-122(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the commercial high-level waste management system, potential changes are being considered that will augment the benefits of an integral monitored retrievable storage (MRS) facility. The US Department of Energy (DOE) has recognized that alternative options could be implemented in the authorized waste management system (i.e., without an integral MRS facility) to potentially achieve some of the same beneficial effects of the integral MRS system. This paper summarizes those DOE-sponsored analyses related to radiation doses resulting from changes in the waste management system. This report presents generic analyses of aggregated radiation dose impacts to the public and occupational workers, of nine postulated changes in the operation of a spent-fuel management system without an MRS facility.

15467 **Alternative low-level waste processing techniques.** Witt, L.A. (ATCOR Inc., Peekskill, NY). *Transactions of the American Nuclear Society;* 53: 125-126(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper presents some new and innovative ways to use commercially available process shields to reduce utility low-level radioactive waste processing costs. With the current market demanding more and more dewatering and in-container solidification, it has become necessary to look for way to offset contractor demurrage and detention charges on casks. Through the use of inexpensive on-site storage containers (OSSCs) with specially designed lids, the cost for processing is significantly reduced. These OSSCs, with secondary ports, allow for in-container dewatering or solidification, thereby amply offsetting cask demurrage charges assessed by mobile service contractors. Several versions of these OSSCs are available to the industry. They range in capacity from 7.35 to 3000 ft^3 and each can be tailored to meet a customer's specific on-site requirements, as well as the requisite compatibility with currently licensed transport containers. Each can be equipped with special lids to accommodate various types of both in-plant and mobil processing systems. The design basis of these processing containers is based on a concrete structure with heavy steel reinforcement.

15468 **Operating a transportable volume reduction and solidification system (TVR-III).** Doyle, R.D.; Rastberger, S.B. (Associated Technologies, Inc., Charlotte, NC). *Transactions of the American Nuclear Society;* 53: 126-127(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The first liquid-waste transportable volume reduction and solidification system (TVR-III) began operation at Clinton Power Station in the spring of 1986. Processing of radioactive material will begin in August 1986 at the Palo Verde Nuclear Generating Station. The TVR-III system is mounted on a 3-m (10-ft)-wide x 14-m (46-ft)-long double low-boy trailer that requires minimal space and

interface connections within the plants, thereby minimizing the impact on plant operations. The one-step volume reduction and bitumen solidification process is well proven with many systems operating on both boiling water reactor (BWR) and pressurized water reactor nuclear power plants in France and Japan.

15469 **Prediction of critical grout parameters: critical flow rate.** Tallent, O.K.; McDaniel, E.E.; Godsey, T.T.; Dodson, K.E. (Oak Ridge National Lab., TN). *Transactions of the American Nuclear Society;* **53**: 127-129(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Waste disposal is rapidly becoming one of the most important technological endeavors of the authors time, and fixation of waste in cement-based materials is an important part of the endeavor. Investigations of given wastes are usually individually conducted and reported. In this study, data obtained from investigation of critical flow rates for three distinctly different wastes are correlated with apparent viscosity data via a single empirical equation. Critical flow rate, which is an important variable in waste grout work, is defined as the flow rate at which a grout must be pumped through a reference pipe to obtain turbulent flow. It is important that the grout flow be turbulent, since laminar flow allows caking on pipe walls and causes eventual plugging. The three wastes used in this study can be characterized as containing (a) high nitrate, carbonate, and sulfate; (b) high phosphate; and (c) high fluoride, ammonium, an suspended solids waste.

15470 **Problems of interpretation in implementing the low-level waste act.** Trubatch, S.L. *Transactions of the American Nuclear Society;* **53**: 130(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Low-Level Radioactive Waste Policy Amendments Act of 1985 (LLRWPAA), like any other statute, presents problems of interpretation that become evident only when attempts are made to implement the statutory language. This paper discusses some of the interpretation problems that utilities have already had to address in evaluating the impact of LLRWPAA on their low-level waste (LLW) disposal operations. These problems include the following specific questions and answers: Does a nonoperating but licensed reactor have an allotment of capacity for disposing of radioactive LLW? Is a full-power operating license limited to 5% of rated power a full-power operating license for the purpose of computing the 15-month delay period in calculating the LLW disposal capacity allotted to new reactors? Do the rules for allocating disposal capacity for unusual volumes of LLW require the separate treatment of each reactor of a multireactor facility? In addition to these specific problems of interpretation, this paper also addresses the general problem of just what is the legislative history available for helping with interpretations of the LLRWPAA's statutory language. Finally, this paper also illustrates how the LLRWPAA can affect the provisions in a regional compact ratified by the US Congress.

15471 **Optimized application of systems engineering to nuclear waste repository projects.** Miskimin, P.A.; Shepard, M. (BDM Corp.). *Transactions of the American Nuclear Society;* **53**: 131(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of this presentation is to describe a fully optimized application of systems engineering methods and philosophy to the management of a large nuclear waste repository project. Knowledge gained from actual experience with the use of the systems approach on two repository projects is incorporated in the material presented. The projects are currently evaluating the isolation performance of different geologic settings and are in different phases of maturity. Systems engineering methods were applied by the principal author at the Waste Isolation Pilot Plant (WIPP) in the form of a functional analysis. At the Basalt Waste Isolation Project (BWIP), the authors assisted the intergrating contractor with the development and application of systems engineering methods. Based on this experience and that acquired from other waste management projects, an optimized plan for applying systems engineering techniques was developed. The plan encompasses the following aspects: project organization, developing and defining requirements, assigning work responsibilities, evaluating system performance, quality assurance, controlling changes, enhancing licensability, optimizing project performance, and addressing regulatory issues. This information is presented in the form of a roadmap for the practical application of system engineering principles to a nuclear waste repository project.

15472 **Prediction of temperatures in underground storage facilities for heat-generating materials at the Idaho Chemical Processing Plant.** Christensen, A.B.; Teuscher, D.R. *Transactions of the American Nuclear Society;* **53**: 131-132(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Idaho Chemical Processing Plant (ICPP) at the Idaho National Engineering Laboratory (INEL) stores solidified high-level waste and some spent reactor fuel in shallow underground containers. These materials generate heat, and their storage configuration must be sized to keep temperatures within allowable limits. Storage facility designs are based on computer-generated temperatures; however, actual measured temperatures taken later are much lower than these design values. Designs based on such overestimated values contribute to increased facility costs. In this paper, temperatures measured around a buried heat source are used to estimate accurate soil thermal properties that will improve the heat transfer model and improve future storage facility designs.

15473 **Solubility tests on borosilicate glasses for West Valley waste immobilization.** Feng, X.; Barkatt, A. (Catholic Univ., Washington, DC). *Transactions of the American Nuclear Society;* **53**: 133-135(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Systematic leach tests on West Valley related glasses were carried out to provide quantitative information on leachant composition as well as glass composition effects. Modeling of glass dissolution, intended to correlate durability of glasses with their chemical composition, was based on the thermodynamic approach developed by Plodinec and Jantzen. Type MCC-3 powder tests were used to find out the pH and solubilities of the current West Valley reference glass, glass A composition for the immobilization of West Valley high-level wastes. The results are shown. Based on these results, leach tests were carried out in a large number of buffered media, all of which were preadjusted to pH 10.4. The results are also shown.

15474 **Radionuclide transport through penetrations in nuclear waste containers.** Chambre, P.L.; Lee, W.W.L.; Kim, C.L.; Pigford, T.H. (Univ. of California, Berkeley). *Transactions of the American Nuclear Society;* **53**: 134-135(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In this paper the authors analyze radionuclide transport through penetrations in nuclear waste containers. Penetrations may result from corrosion or cracking and may be through the container material or through deposits of corrosion products. The analysis deals with the resultant radionuclide transport, but not with the way that these penetrations occur. Numerical illustrations are provided for diffusive nuclide flux through these apertures from mathematical expressions derived by Chambre. The US Nuclear Regulatory Commission's performance objective for the waste package subsystem requires substantially complete containment within the waste package from 300 to 1000 yr. Mass transfer through container holes may affect attaining substantially complete containment and may also affect compliance with the release rate requirement. Analysis of radionuclide transport through penetrations aids evaluation of individual barriers, such as Zircaloy cladding for spent fuel.

15475 **Cumulative releases of radionuclides from uncontained waste packages.** Lee, W.W.L.; Kim, C.L.; Chambre, P.L.; Pigford, T.H. (Univ. of California, Berkeley). *Transactions of the American Nuclear Society;* **53**: 135-136(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The US Nuclear Regulatory Commission's performance objective for the waste package subsystem requires substantially complete containment of all radionuclides within the waste package for 300 to 1000 yr for anticipated processes and events. This requirement has been interpreted by repository projects as requiring an envelope around the waste solid that will not be penetrated for 300 to 1000 yr. To provide a technical basis for further interpretation of the containment requirement, however, mass-transfer theory can be used to predict the extent of radionuclide release from a waste solid into surrounding rock, even in the absence of a separate containment envelope. It is possible that the barrier system of waste solid, backfill, and rock can result in substantial containment within the waste solid and backfill during time periods of interest. Calculations of 1000- and 10,000-yr cumulative releases of radionuclides from a waste solid without separate containment are presented in this paper.

15476 **Mass transfer of soluble species into backfill and rock.** Chambre, P.L.; Kang, C.H.; Lee, W.W.L.; Pigford, T.H. (Univ. of California, Berkeley). *Transactions of the American Nuclear Society;* **53**: 136-137(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In a spent-fuel waste package placed in a geologic repository, the solublecesium and iodine isotopes accumulated in fuel-cladding gap, voids, and grain boundaries of spent-fuel rods are expected to dissolve rapidly when groundwater penetrates the fuel rods. Chambre's previous mass-transfer analyses and calculations by Kim et al. for spent fuel without backfill show that this soluble gap activity of cesium an iodine is the greatest contributor to fractional release rates for these radioelements into surrounding rock, in qualitative agreement with laboratory experiments on spent-fuel rods with locally perforated classing. Chambre has extended the mass-transfer analysis to include diffusion of soluble species through backfill into surrounding rock in one-dimensional planar geometry. Here the authors present numerical illustrations of release rates into porous rock as a function of backfill thickness for parameters typical of a wet-rock repository. Results are compared with the US Nuclear Regulatory Commission (NRC) criterion for release rates.

15477 **Remote handling of canisters containing nuclear waste in glass at the Savannah River Plant.** Callan, J.E. (Savannah River Plant, Aiken, SC). *Transactions of the American Nuclear Society;* **53**: 478-479(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Defense Waste Processing Facility is being constructed at the Savannah River Plant at a cost of $870 million to immobilize the defense high-level radioactive waste. This radioactive waste is being added to borosilicate glass for later disposal in a federal repository. The borosilicate glass is poured into stainless steel canisters for storage. These canisters must be handled remotely because of their high radioactivity, up to 5000 R/h. After the glass has been poured into the canister which will be temporarily sealed, it is transferred to a decontamination cell and decontaminated. The canister is then transferred to the weld cell where a permanent cap is welded into place. The canisters must then be transported from the processing building to a storage vault on the plant until the federal repository is available. A shielded canister transporter (SCT) has been designed and constructed for this purpose. The design of the SCT vehicle allows the safe transport of a highly radioactive canister containing borosilicate glass weighing 2300 kg with a radiation level up to 5000 R/h from one building to another. The design provides shielding for the operator in the cab of the vehicle to be below 0.5 rem/h. The SCT may also be used to load the final shipping cask when the federal repository is ready to receive the canisters.

15478 **Equipment experience in a radioactive LFCM vitrification facility.** Holton, L.K. Jr.; Dierks, R.D.; Goles, R.W.; Sevigny, G.J.; Surma, J.E.; Thomas, N.M. (Pacific Northwest Lab., Richland, WA). *Transactions of the American Nuclear Society;* **53**: 479-481(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Under sponsorship of the US Department of Energy, the Pacific Northwest Laboratory has installed and is operating a pilot-scale radioactive liquid-fed ceramic melter (RLFCM) system in a shielded hot cell at Hanford, Washington. The system, designed to vitrify high-level liquid wastes has been in radioactive service for greater than two years. During that time, ~10 MCi of fission product activity has been converted to a borosilicate glass waste form. This paper discusses the specific remote equipment performance of the vitrification system.

15479 **Stainless steel decontamination manipulators.** Sullivan, R.J. *Transactions of the American Nuclear Society;* **53**: 482(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Three, large-volume coverage manipulator systems were designed and built for the Defense Water Processing Facility at the Savannah River Laboratory. These stainless steel systems will be used for high-pressure spray decontamination of waste containers and large process equipment modules. Each system has a manipulator arm, folding boom, and vertical drive and guide structure. Handling capacity is 45 kg, horizontal reach is 4.6 m with a 180-deg swing motion, and the vertical travel is 6 m. The system is remotely removable and replaceable in modules using an overhead crane and an impact wrench. The manipulator arm has seven motions: Shoulder rotation and pivot, elbow pivot, wrist pivot and rotation, and grip open-close. All motions are variable speed and are slip-clutch protected to prevent overloading from external forces (collisions).

15480 **Closed-circuit television and remote crane control for vitrification facilities.** Bennett, P.R.; Morrison, J.E. (PRC Systems Services, McLean, VA). *Transactions of the American Nuclear Society;* **53**: 482-484(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Defense Waste Processing Facility is currently under construction at the Savannah River Plant. Within the main process cell (MPC), a 117-ton capacity bridge crane is to be installed to facilitate remote handling and processing operations. E. I. du Pont de Nemours and Company defined and PRC designed and built an operational prototype closed-circuit television (CCTV) and remote control system. Phase I of the program developed the CCTV system to prove the feasibility of a remote viewing system. The phase II program added full crane functional remote control and installed it on an existing hot canyon crane. This prototype system established the criteria for the development of the MPC crane and future crane systems. Parameters were: (a) failsafe assurance, (b) high liability, (c) ease of maintenance for dressed-out personnel, (d) rapid malfunction diagnosis, (e) ergonomics, (f) known picture orientation, and (g) audio system to monitor operational sounds. The complete system has undergone a total demonstration of its operational capabilities using simulator circuits for crane functions and is now being integrated with the crane for a full operational demonstration. The system will then be mothballed pending installation by construction personnel ready for cold startup of the plant in 1988.

15481 **Remote lighting systems for the defense waste processing facility.** Heckendorn, F.M.; Divona, C.J. (Savannah River Plant, Aiken, SC). *Transactions of the American Nuclear Society;* **53**: 484(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Defense Waste Processing Facility (DWPF) is under construction at the Savannah River Plant. In DWPF, an immobilization process solidifies radioactive waste sludge by vitrification into a leach-resistant borosilicate glass. The mixture of waste and glass solidifies in stainless steel containers for eventual transportation to an off-site federal repository. The DWPF contains a number of hot cell canyons that are remotely maintained using only a crane and crane-held impact wrench for replacing the equipment. In general, viewing into these canyons is accomplished through shielded windows and by the use of closed-circuit television (CCTV). Demonstration of the prototype remote light fixtures for the DWPF

canyon was completed in 1984, and the actual plant equipment is scheduled for completion this year.

15482 Canister grapple for the defense waste processing facility. Walker, K.L.; White, J.R.; Farnstrom, K.A. (Remote Technology Corp., Oak Ridge, TN). *Transactions of the American Nuclear Society;* **53**: 489-490(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Radioactive waste processed at the Defense Waste Processing Facility (DWPF) will be vitrified and stored in Type 304L stainless steel canisters. A unique grapple will be utilized for all canister transfer operations within the DWPF. The grapple mechanism has been designed with a two-step release, requiring it to be set down twice before the canister will be released. A prototype of the grapple has been fabricated and tested. Production units are currently undergoing acceptance testing and will be shipped to the DWPF in August 1986.

15483 Remote viewing of melter interior: defense waste processing facility. Heckendorn, F.M. (Savannah River Lab., Aiken, SC). *Transactions of the American Nuclear Society;* **53**: 490-491(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Defense Waste Processing Facility (DWPF) is under construction at the Savannah River Plant. In DWPF, an immobilization process solidifies high-level radioactive waste material into a leach-resistant borosilicate glass. A molten mixture of waste and glass is produced in an electrically heated melter. The mixture is subsequently allowed to solidify in a stainless steel canister for eventual transportation to an offsite federal repository. An elaborate chemical process is used to remotely prepare the radioactive waste for conversion into the final glass matrix. A final mixture of concentrated radioactive waste and finely powdered glass frit is metered into the melter. Molten glass exits the melter into waiting canisters. The control and monitoring of the melter operation is crucial to the overall DWPF operation. A remote system has been developed and demonstrated for continuous viewing of the melter interior during all phases of its operation. Viewing of the interior is one of the best methods for confirming proper operation of the melter. It serves to confirm the sensor-based controls and provide sensing of unanticipated parameters.

15484 Demonstration of a remotely operated TRU waste size-reduction and material handling process. Stewart, J.A. III. (Savannah River Lab., Aiken, SC). *Transactions of the American Nuclear Society;* **53**: 498-499(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Noncombustible ^{238}Pu and ^{239}Pu waste is generated as a result of normal operation and decommissioning activity at the Savannah River Plant and is being retrievably stored at the Plant. As part of the long-term plant to process the wastes for permanent disposal, a remote size-reduction and material handling process is being cold-tested at Savannah River Laboratory to provide design support for the Plant TRU Waste Facility scheduled to be completed in 1992. Testing of the equipment in a complete cold demonstration, known as the Components Test Facility, is scheduled to begin in November 1986 and will run through 1987.

15485 Operation of a radiochemical uranium nitrate solidification facility. McGinnis, C.P.; Collins, E.D. (Oak Ridge National Lab., TN). *Transactions of the American Nuclear Society;* **53**: 155-156(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A unique radiochemical processing facility at Oak Ridge National Laboratory has been operated to convert ~1000 kg of highly fissile and radioactive uranium (containing ~76% ^{236}U, ≈10% ^{233}U, and ~140 ppm ^{232}U) in the form of a nitrate solution to a packaged solid oxide that is suitable for safe storage. The project was called the Consolidated Edison Uranium Solidification Program (CEUSP) because the uranium was the product of an experimental power reactor fuel, consisting of fully enriched ^{235}U and thorium, which was irradiated in the Indian Point-1 Reactor in the early 1960s. The irradiated fuel was reprocessed at the Nuclear Fuel Services's plant at West Valley, New York in late 1968, and the uranium product solution was transported to Oak Ridge and stored. The material was originally considered quite valuable, but the intense radiation associated with the decay of ^{232}U precluded further use. Several options were explored to solidify the material for safe storage. This paper will describe the design and development of the solidification process and review the operation history.

15486 Materials aspects of nuclear waste isolation. Bennett, J.W. (US Dept. of Energy, Washington, DC). pp 87-91 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—).

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

This paper is intended to provide an overview of the nuclear waste repository performance requirements and the roles which we expect materials to play in meeting these requirements. The objective of the U.S. Dept. of Energy's (DOE) program is to provide for the safe, permanent isolation of high-level radioactive wastes from the public. The Nuclear Waste Policy Act of 1982 (the Act) provides the mandate to accomplish this objective by establishing a program timetable, a schedule of procedures to be followed, and program funding (1 mil/kwhr for all nuclear generated electricity). The centerpiece of this plan is the design and operation of a mined geologic repository system for the permanent isolation of radioactive wastes. A nuclear waste repository contains several thousand acres of tunnels and drifts into which the nuclear waste will be emplaced, and several hundred acres for the facilities on the surface in which the waste is received, handled, and prepared for movement underground. With the exception of the nuclear material-related facilities, a repository is similar to a standard mining operation. The difference comes in what a repository is supposed to do - to contain an isolate nuclear waste from man and the environment.

0530 Environmental Aspects

15487 (BMI/ONWI—617) Rail transportation corridor analysis report: Deaf Smith County location in the Palo Duro Basin, Texas. (NUS Corp., Gaithersburg, MD (USA); Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Oct 1986. Contract AC02-83CH10140. 206p. NTIS, PC A10/MF A01; 1; GPO Dep. File Number DE87005576.

An environmental data base was developed for the purpose of preliminary siting of potential rail access corridors between existing rail lines and the potential repository site in Deaf Smith County, Texas. The categories of the data base were environmental conditions considered significant in rail line construction and operation. These included land cover, population areas, slope, surface hydrology, cultivated prime agricultural lands, cultural features, and utility rights-of-way. The categories were divided into avoidance, constraint, and opportunity features, and the constraint features were then weighted for environmental impact potential. An environmental screening analysis using the computerized Geographical Information System (GIS) was then performed. The analysis involved applying the GIS overlay process to the various constraint data categories to produce a composite constraint map of the study area. The composite constraint map, color coded for various levels of constraint to corridor siting, was subsequently used as a guide for the selection of a series of alternative corridors. By means of a further application of GIS procedures, the corridor alternatives were statistically analyzed for adherence to corridor selection guidelines. In addition, a supplementary analysis was performed to compare the alternatives in terms of four impact categories: road crossings, construction costs, degree of land disruption, and population impact. The statistical and supplementary impact analyses led to a preliminary selection of a preferred corridor. The corridor assessment process indicated the importance of analyzing alternative trade-offs, as well as the need for more detailed investigation of certain conditions and a detailed comparison of alternatives prior to final corridor siting.

15488 **(DOE/WIPP—86-006) 1986 annual water quality data report for the Waste Isolation Pilot Plant.** Uhland, D.W.; Randall, W.S. (I. T. Corp., Carlsbad, NM (USA); Westinghouse Electric Corp., Carlsbad, NM (USA). Technology Development Dept.). Sep 1986. Contract AC04-86AL31950. 408p. NTIS, PC A18/MF A01; 1; GPO Dep. File Number DE87005590.

The Waste Isolation Pilot Plant (WIPP), a Department of Energy facility located in southeastern New Mexico, is designed to demonstrate the safe disposal of transuranic radioactive waste. The Water Quality Sampling Program (WQSP) supports four major programs for the WIPP: site characterization activities, Radiological Baseline, Ecological Monitoring and performance assessment. Results from 22 wells sampled from January 1985 through April 1986 under the WQSP are presented. Water quality data from four water-bearing zones have been collected. These zones are the Culebra and Magenta Dolomite Members of the Rustler Formation, the Dewey Lake Red Beds and the Hays sandstone member of the Bell Canyon Formation. Results from the sampling include field chemistry data as well as general water quality parameters, trace metals, and priority pollutants. The salinity of the Culebra Member of the Rustler Formation varies significantly over the area. The chloride concentration ranges from thirty to over a hundred thousand parts per million. This report summarizes the first of several samplings that will define the pre-operational water quality data base for WIPP project.

0540 Health And Safety

15489 **(CEA-DAS—219) Validation study of the intertran model for assessing risks of transportation accidents: Road transport of uranium hexafluoride.** Tomachevsky, E.G.; Ringot, C.; Pages, P.; Hubert, P. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France).. Dept. d'Analyse de Surete). Jun 1985. 24p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750554.

The INTERTRAN code was developed by the IAEA in order to provide member states with a simple and rapid method of assessing the risk involved in the transportation of radioactive materials and one which was applicable on a worldwide scale. Before being used, this code must be validated and the CEA thus compared the results obtained with the conventional risk assessment methods used by the CEPN with those derived from INTERTRAN. This paper gives the results of the studies made on the subject of road transportation of uranium hexafluoride in France. The conventional accident risk assessment method gave a figure of 8.84 x 10^{-4} deaths/year, whereas INTERTRAN announces 1.78 x 10^{-3}. To these figures should be added 3.38 x 10^{-3} deaths/year, which is the intrinsic road risk, whatever the goods carried. In relation to conventional estimates, the INTERTRAN forecasts are five times lower for the U risk and twenty times higher for the HF risk. The chemical risk is indeed the most prevalent one in this case. Other comparisons are needed to validate this code.

15490 (CONF-860203—, pp 1-8) **Development of residual radioactivity criteria.** Lichtman, S.; Ronca-Battista, M. (Environmental Protection Agency, Washington, DC). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The US Environmental Protection Agency (EPA) is developing public health radiation protection criteria for residual radioactivity following cleanup of contaminated lands and facilities. Satisfaction of the criteria will allow the site to be safely released from all controls based on radioactivity. The criteria may be issued as broad Federal guidance, specific environmental standards, or both. The criteria will apply to sites owned or used by licensees of the Nuclear Regulatory Commission or its Agreement States, the Department of Energy, the Department of Defense, the former Atomic Energy Commission and Manhattan Engineering District, and where naturally-occurring or accelerator-produced materials have been used. The EPA is supporting the development of this project with the following activities. First, an inventory of never licensed or otherwise poorly documented sites is being compiled in conjunction with the National Conference of Radiation Control Program Directors, to ensure that the criteria are appropriate for all site types and satisfy existing and future decommissioning needs. Second, the relationship between residual radioactivity and public exposures under a variety of site and future use conditions is being studied. This information will enable EPA to evaluate the health impacts of alternative levels of residual radioactivity. Finally, nontechnical issues to be resolved include how the criteria and the supporting analyses could apply to recycled materials, how these criteria will relate to below regulatory concern wastes, and whether the criteria should include limits on planned reliance on institutional controls.

15491 (CONF-860203—, pp 9-18) **National and international considerations of a de minimis dose.** Kocher, D.C. (Oak Ridge National Lab., TN). Dec 1986. NTIS $23.00. File Number DE86900357. (CONF-860203—). Contract AC05-84OR21400.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

This paper reviews current efforts by national and international agencies to establish a generally applicable de minimis radiation dose. A de minimis dose is derived from a level of risk that is widely regarded as negligible by the general public, and defines a level below which control of radiation exposures would be deliberately and specifically curtailed. A de minimis dose can be used to derive quantities of radionuclides in various materials that would be exempt or below regulatory concern for such purposes as resale, recycling, or disposal. The specification of exempt levels of radioactivity could lead to significant reductions in the required capacity of radioactive waste storage and disposal facilities and in the costs associated with management of slightly contaminated materials. A de minimis dose must be set well below the limit on acceptable dose for public exposures. A de minimis dose in the range 0.1-30 mrem (0.001-0.3 mSv) per year committed effective dose equivalent has been considered by various agencies, with most recommendations at 1 or 5 mrem per year. A value of 30 mrem per year may be too high for a de minimis dose, because a dose limit of 25 mrem per year is widely used in the US for regulating specific practices (e.g., low-level waste disposal). A value as low as 0.1 mrem per year could lead to great difficulties in measuring associated levels of radioactivity. They propose a de minimis dose of 1 mrem (0.01 mSv) per year committed effective dose equivalent averaged over a lifetime and 5 mrem (0.05 mSv) in any year. These values are 1% of the limits on acceptable dose from all sources of exposure that recently have been proposed by the National Council on Radiation Protection and Measurements. The proposed de minimis dose corresponds to a lifetime risk from continuous exposure of about 10^{-5}.

15492 (CONF-860203—, pp 19-26) **Allowable residual contamination levels for decommissioning: revisions to the method.** Kennedy, W.E. Jr.; Napier, B.A. (Pacific Northwest Lab., Richland, WA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

In 1983, Pacific Northwest Laboratory published a series of reports that describe the Allowable Residual Contamination Level (ARCL) method for decommissioning US Department of Energy (DOE) nuclear facilities and sites. The purpose of the method was to provide engineers with a useful tool for conducting safety and cost comparisons for decommissioning alternatives. The ARCL results are based on a scenario/exposure-pathway analysis and compliance with an annual radiation dose limit. Recently, revisions were made to the method that are designed to make it more useful for site- or facility-specific model applications. These revisions include analysis of additional exposure scenarios and pathways, the addition of area/volume correction factors to account for small areas or volumes of residual contamination, and an evaluation of barrier and waste-form credit factors to be applied in the analysis. This paper contains a description of the area/volume correction factors that are intended to permit the model to account for small areas or volumes of residual contamination.

15493 (CONF-860203—, pp 27-36) **Dose guidelines for decontamination and decommissioning projects.** Voilleque, P.G. (Science Applications International Corp., Idaho Falls, ID). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Dose guidelines are needed for evaluations of the potential exposure of members of the public to residual radioactivity following decontamination and decommissioning (D & D). These are then translated into guidelines for radionuclide concentration in media of interest, such as soil, using scenarios that define potential exposure pathways. The scenarios consider individuals whose location and behavior cause them to receive doses higher than the average person. These persons form the critical groups for radiation exposure following D & D activities. Two dose guidelines were developed. The higher annual dose guideline (D, mrem) defines an action level. If the projected annual dose (H, mrem) exceeds D, then action to reduce the potential dose is required. The lower annual dose guideline (DD, mrem) defines a no-action level. Projected doses below this level are trifling and of no regulatory concern. Selection of the two dose guidelines was based upon a review of existing national and international guidance. The effective dose equivalent was judged to be the appropriate dosimetric quantity. The selected value of D is 100 mrem, corresponding to a risk of about 10^{-5} per year. The selected value of DD is 1 mrem, carrying a risk of about 10^{-7} per year. It is emphasized that DD is not a goal or target for D & D activities, but a no-action level. For projected doses in the range DD < H < D, the ALARA principle applies. The cost and feasibility of clean-up as well as the benefits must be evaluated to determine the ALARA endpoint for a particular action.

15494 (CONF-860203—, pp 37) **Manual for implementing residual radioactivity guidelines.** Gilbert, T.L.; Eckerman, K.F.; Hansen, W.R.; Healy, J.W.; Kennedy, W.E.; Napier, B.A.; Solday, J.K. (Argonne National Lab., IL). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The US Department of Energy (DOE) has recently issued guidelines for residual radioactivity at Formerly Utilized Sites Remedial Action Program (FUSRAP) and remote Surplus Facilities Management Program (SFMP) sites. A manual for implementing these guidelines has been prepared jointly by four DOE laboratories (ANL, LANL, ORNL, and PNL) and is being issued as a supplement to the guidelines. The manual presents procedures and tables for deriving site-specific guidelines for levels of residual radionuclide concentrations in soil that must not be exceeded if a site is to be released for unrestricted use. Guidance for implementing DOE ALARA policy for remedial actions is also included. The concentration factor method is used in the pathway analysis for deriving soil guidelines. The analysis has been structured in a manner that explicitly identifies all of the factors involved. Tables are provided for dose-conversion factors and pathway factors from which environmental transport factors for each radionuclide and pathway may be calculated. The scenarios used for deriving the environmental transport factors and dose conversion factors, and the manner in which the information provided in the manual is used to derive site-specific soil guidelines will be presented.

15495 (CONF-860203—, pp 39-50) **Residual surface contamination limits: problems in interpretation and implementation.** Wynveen, R.A.; Moe, H.J. Robinet, M.J.; Veluri, V.R. (Argonne National Lab., IL). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

During the decontamination and decommissioning of facilities requiring remedial action, one is often faced with making decisions for the disposition of materials and equipment having various levels of residual surface radioactive contamination. The existing limits for the release of materials and equipment with such surface contamination have evolved historically from the proposed ANSI Standard N328, and U.S.N.R.C. Regulatory Guide 1.86. Experience gained by the Health Physics Group at Argonne National Laboratory in decommissioning a number of varied facilities has revealed several difficulties in the interpretation and implementation of these limits. Included in these difficulties are: (i) interpretation of these limits with respect to certain radionuclides and radionuclide chains, (ii) apparent inconsistencies in the assignment of certain radionuclides to a given hazard group, (iii) limited guidance in the treatment of contaminated material and equipment containing contributions from several radionuclides, and (iv) implementation problems in the interpretation of instrument readings, particularly when the contamination level is at or near the instrument detection limit. These and other problems are addressed from the standpoint of practical field applications. In addition, certain suggested modifications, designed to remove inconsistencies in the limits, are presented.

15496 (CONF-860203—, pp 51) **Decision making during radiological designation surveys.** Eng, J. (New Jersey Dept. of Environmental Protection, Trenton). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Investigations to identify contaminated sites are often performed under intense public scrutiny. Local officials, property owners and the general public seek assessments in time frames much shorter than investigators may consider sufficient to fully understand a problem. The designation survey is a critical factor in the entire remedial action program. Overly conservative designation processes can lead to many more properties requiring detailed characterization and possible economic and legal consequences. On the other hand, a cursory designation process may lead to too few properties and a premature judgement concerning the existence and extent of contamination with possible economic and legal consequences. Remedial action and investigative agencies need to evaluate their designation survey procedures. As an illustration, several New Jersey sites will be reviewed in terms of the approach various federal and state agencies have taken in the initial identification and designation processes.

15497 (CONF-860203—, pp 53-62) **UMTRA consent form acquisition: a survey of nonrespondents.** Gonsalves, L.L.; Carpenter, D.; Borak, T.B.; Kearney, P. (Colorado State Univ., Fort Collins). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Radiological Survey Activities group of the Health and Safety Research Division at Oak Ridge National Laboratory is the Inclusion Survey Contractor (ISC) for the Uranium Mill Tailings Remedial Action (UMTRA) project in Grand Junction, Colorado. The ISC is responsible for performing any required radiological surveys and data analyses for the recommendation of inclusion or exclusion of designated properties in the UMTRA project. One of the responsibilities of the ISC is to obtain consent from the property owners to conduct radiological surveys. In Grand Junction, Colorado 30-40% of the owners of designated properties have not responded to the consent-for-access requests sent by certified mail. A questionnaire was designed to identify and study this nonresponse through personal interviews with 100 randomly selected nonrespondents. A profile of the population of nonrespondents, reasons for nonresponse, as well as suggestions to encourage response were identified and analyzed.

15498 (CONF-860203—, pp 63-68) **Health physics program for the Edgemont Uranium Mill decommissioning project.** Polehn, J.L.; Wallace, R.G.; Reed, R.P.; Wilson, G.T. (Tennessee Valley Authority, Chattanooga). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Tennessee Valley Authority (TVA) is actively involved in decommissioning a uranium mill located near the town of Edgemont, South Dakota. The Edgemont Mill Decommissioning

Project, which is unique in many respects, will involve dismantlement of the old inactive mill building and excavation and transportation of several million tons of uranium mill tailings to a permanent disposal site. To ensure that workers are adequately protected from radiation exposure during decommissioning operations, a health physics program appropriate for the decommissioning situation was developed. The Edgemont Mill Decommissioning Project Health Physics Manual (HPM) gives the programmatic requirements for worker radiation protection. The requirements of the HPM are implemented by means of detailed onsite operating procedures. The Edgemont project health physics program was developed using currently available regulations and guidance for an operating uranium mill with appropriate modifications for decommissioning. This paper discusses the development, implementation, and documentation of that program.

15499 (CONF-860203—, pp 79) **Industrial safety and health physics interactions during slurry transfer of 1000 curies of radium residues at the Niagara Falls Storage Site (NFSS).** Williams, P.A. (Bechtel National, Inc., Oak Ridge, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Bechtel National, Inc. performed radiological decontamination operations on the Niagara Falls Storage Site in Lewiston, New York. A primary activity was the hydraulic transfer of 3000 cubic yards of highly contaminated radium residues from the 160′ tall K-65 Tower, approximately 5000′ across the site to an engineered storage facility. The industrial safety hazards associated with the residue transfer were unique and involved the constant coordination of radiological controls and personal safety constraints for personnel working 160′ above ground level. Safety was of paramount importance for the life-threatening confined space entries, 160′ fall potential, approximately 5000 mancage trips, 2.5 million cubic feet of breathing air supplied, heat stress concerns, and implementation of emergency rescue provisions with subcontractor personnel and local fire-rescue agencies. The methods and techniques of the planning, operational monitoring, and enforcement of the safety controls during this radiological cleanup operation will be presented. Emphasis will be directed to problem areas and solutions that can be applied to similar radiological operations.

15500 (CONF-860203—, pp 81-88) **Health physics experience during a uranium and thorium pond closure.** Cole, L.W.; Prewett, S.V. (Aerojet Heavy Metals Co., Jonesborough, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Aerojet Heavy Metals Company (AHMC) recently completed a pond decommissioning project which involved the movement and interment of approximately 600,000 cubic feet of uranium- and thorium-contaminated soil. This work was performed by a construction company using standard earth moving equipment and their general labor force. In addition to the construction company employees, geotechnical quality assurance was performed by a soils test engineer and overall construction management was performed by a resident project engineer. Certification of cleanup and inventory sampling were done by contract personnel also. In general, a large complicated project involving several different parties, a large amount of equipment and a large work area was completed with minimal exposure and no spread of contamination to uncontrolled areas. Detailed pre-planning with the project management staff and careful coordination with the actual construction contractor is required. Predictive methods of contamination and air activities can be valuable in assessing the program requirements.

15501 (CONF-860203—, pp 89-94) **Overview of decommissioning and decontamination technical information support activities funded by the U.S. Department of Energy's remedial action programs.** Owen, P.T. (Oak Ridge National Lab., TN). Dec 1986. NTIS $23.00. File Number DE86900357. (CONF-860203—). Contract AC05-84OR21400.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

In 1979 the US Department of Energy (DOE) established the Remedial Action Program Information Center (RAPIC) at the Oak Ridge National Laboratory to provide technical information support to the Surplus Facilities Management Program, DOE's national decommissioning and decontamination (D & D) program which is managed by DOE's Richland Operations Office and UNC Nuclear Industries, Inc., and to the other DOE remedial action programs. Specific information activities that RAPIC performs to support the DOE's programs and the D & D community include: maintaining a computerized bibliographic database containing about 4500 annotated citations (about 2000 on D & D) and a database of 1800 contacts involved with remedial action work at radioactively contaminated sites; publishing an annual bibliography, Nuclear Facility Decommissioning and Site Remedial Actions, A Selected Bibliography, ORNL/EIS-154 (six volumes published); maintaining a document repository and providing copies of requested publications; and performing manual and computerized searches of the technical literature. The most significant RAPIC function is serving as a focal point for D & D information. With the extensive resources at its command, RAPIC is in a unique position to provide a comprehensive information base to the D & D community. DOE makes these services available to foster good public relations and promote cooperation and information exchange.

15502 (CONF-860203—, pp 95-103) **Decommissioning planning and the assessment of alternatives for the Hanford production reactors.** Miller, C.E.; Potter, R.F.; Chattin, J.C. (Dept. of Energy, Richland, WA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The US Department of Energy Hanford Site, near Richland, Washington, is the location of eight shut-down plutonium production reactors that are now in safe storage. These reactors each operated between 14 and 24 years, until shutdown of the last reactor in 1971. Comprehensive decommissioning planning has been conducted for the reactors and their support facilities actual decommissioning work has begun on some support facilities. Decommissioning criteria used at Hanford are discussed in this paper, as well as major planning assumptions. Decommissioning alternatives have been identified and assessed. The final decommissioning alternative will be selected through the National Environmental Policy Act (NEPA) process. The NEPA process for the Hanford reactor decommissioning has been initiated and will include a complete Environmental Impact Statement.

15503 (CONF-860203—, pp 105-113) **Environmental assessment relating to the decommissioning of Strontium Semiworks facility.** Hale, V.Q.; Speer, D.R. (Rockwell Hanford Operations, Richland, WA). Dec 1986. NTIS $23.00. File Number DE86900357. (CONF-860203—). Contract AC06-77RL01030.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Strontium Semiworks complex on the Hanford Site was a pilot plant for radioisotope separation processes. The Strontium Semiworks facility was operated from 1949 to 1967 at which time it was retired and has been maintained in safe storage since then. The conditions of the building, the cost of safe storage, and the potential for radioisotope release lead to a decision in 1983 to decommission the facilities. The decommissioning alternatives considered were (1) earthen entombment without demolition, (2) partial dismantlement/entombment, (3) razing of all above ground structures, (4) total dismantlement, and (5) no action. An Environmental Assessment for the project was prepared in 1984 and a Finding of No Significant Impact issued on May 15, 1985. The approved method for decommissioning was Alternative 2 based on stability of the end product, cost of the project and projected impacts.

15504 (CONF-860203—, pp 115-124) **Evaluation of doses and risks from different decontamination and decommissioning strategies using the PRESTO-II methodology.** Fields, D.E. (Oak Ridge National Lab., TN). Dec 1986. NTIS $23.00. File Number DE86900357. (CONF-860203—). Contract AC05-84OR21400.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The PRESTO-II methodology may be applied to evaluate doses and health risks from a variety of decontamination and decommissioning activities. This methodology has been implemented in the form of a computer code that has been applied to several sites, and that has been extensively documented. Radionuclide inventories are specified as separate contamination sources either present on the ground surface, covered by non-radioactive soils but lying above the water table, suspended in the atmosphere, or dissolved in surface waters. Hydrologic transport mechanisms considered in the PRESTO-II methodology include chemical exchange, ponding and overflow, surface water transport, groundwater transport, and pumping contaminated groundwater from wells. Varied scenarios of water usage are treated. Atmospheric inputs are based on both resuspension factor and resuspension rate approaches, with inhalation and immersion doses based on a Gaussian plume transport calculation. Site activities that are considered include land clearing, farming, and residing on the site. Exposure and dose calculations are derived from the US Nuclear Regulatory Commission Reg. Guide 1.109 approach, while risk calculations use a life-table approach developed for the US Environmental Protection Agency (EPA). Internal dose conversion factors are taken from ICRP 26 and 30, while risk conversion factors are values suggested by EPA.

15505 (CONF-860203—, pp 125-133) **Estimating doses and risks associated with decontamination and decommissioning activities using the CRRIS.** Miller, C.W.; Sjoreen, A.L.; Cotter, S.J. (Oak Ridge National Lab., TN). Dec 1986. NTIS $23.00. File Number DE86900357. (CONF-860203—). Contract AC05-84OR21400.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Computerized Radiological Risk Investigation System (CRRIS) is applicable to determining doses and risks from a variety of decontamination and decommissioning activities. For example, concentrations in air from resuspended radionuclides initially deposited on the ground surface and the concentrations of deposited radionuclides in various soil layers can be obtained. The CRRIS will estimate exposure to radon and its progeny in terms of working-level months, and will compute the resulting health risks. The CRRIS consists of seven integrated computer codes that stand alone or are run as a system to calculate environmental transport, doses, and risks. PRIMUS output provides other CRRIS codes the capability to handle radionuclide decay chains. ANEMOS and RETADD-II calculate atmospheric dispersion and deposition for local and regional distances, respectively. Multiple ANEMOS runs for sources within a small area are combined on a master grid by SUMIT. MLSOIL is used to estimate effective ground surface concentrations for dose computations. TERRA calculates foodchain transport, and ANDROS calculates individual or population exposures, doses, and risks. Applications of the CRRIS to decontamination problems are discussed.

15506 (CONF-860203—, pp 135-142) **Composite empirical and analytical method to predict the magnitude of surface contamination in semi-accessible areas.** Distenfeld, C.H.; Vallem, R.J. (GPU Nuclear Corp., Middletown, PA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The purpose of this study was to develop an exposure rate model for the radiation fields within the lower portion of the A D-ring in the Three Mile Island Unit 2 (TMI-2) reactor building (RB) containment. The model was based on vertical strings of thermoluminescent dosimeter (TLD) measurements made adjacent to the steam generator. The measurements were made with standard Panasonic personnel dosimeters assembled on plastic strips to produce TLD strings. The dosimeters were vertically spaced about 30 cm apart. The TLD strings were lowered about 7.8 meters from the elevation 308' platform to the elevation 282.5' basement floor. The string were placed midway between the vertical axis of the steam generator and cold legs. About 3 meters above the basement floor the string passed a metal platform that had been submerged in primary coolant released during the accident. Six discrete surface sources were mathematically modeled to closely correspond to the surfaces that exposed the TLD strings. The models used were a disc geometry for the concrete floor; vertical surface cylinders for the cold legs and steam generator; a horizontal surface cylinder for the J connection between the cold legs and steam generator; a rectangular surface geometry for the platforms; and a constant term to account for unmodeled sources. The six models were used to calculate responses corresponding to the TLD locations. This resulted in a matrix of 15 equations with six unknowns. An iterative method requiring best positive solutions was used to solve the overspecified set simultaneously. The results indicate that the surface activity varies from 5E9 to 6E11 Bq/m^3 (14 to 1670 μCi/cm^3).

15507 (CONF-860203—, pp 143-150) **Implementation of decommissioning criteria in the conceptual design of the MRS facility.** Gross, D.L.; Wilcox, A.D.; Huang, S. (Ralph M. Parsons Co., Pasadena, CA). Dec 1986. NTIS $23.00. File Number DE86900357. (CONF-860203—). Contract AC06-84RL10436.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The US Department of Energy (DOE) selected the Ralph M. Parsons Company (RMP) to prepare the conceptual design of the Monitored Retrievable Storage (MRS) Facility. The purpose of this facility is to consolidate and temporarily store spent fuel from civilian nuclear power plants. In addition, it will overpack, handle, and store high-level radioactive waste from non-defense related sources. The Functional Design Criteria (FDC) prepared by Pacific Northwest Laboratories, as well as 10 CFR 72, requires the facility to be designed for decommissioning, with provisions to facilitate decontamination of structures and equipment to minimize the volume of radioactive wastes and contaminated equipment at the time of decommissioning. Many problems associated with decommissioning a nuclear facility have been identified in recent years and the design for the MRS Facility presents a unique opportunity for RMP to implement decommissioning criteria into the conceptual design of a major nuclear facility. The provisions made in the design to facilitate decommissioning include good housekeeping during operations, controlled personnel access, access for equipment removal, equipment design, installed radiation monitors, adequate work space, installed decontamination systems and areas, control of all effluents, and operational documentation. These topics will be the major points of discussion for this paper.

15508 (CONF-860203—, pp 151-160) **Simplified pathway analysis approach for establishing limits for soil contamination.** Till, J.E.; Whittaker, M.S.; Moore, R.E. (Radiological Assessment Corp., Neeses, SC). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Release from a byproduct material license requires demonstration that radioactive contamination has been removed to the extent practicable. An approach requiring only minimal data inputs was developed which accounts for the potential pathways of exposure from soil contamination and yields a conservative estimate of the annual dose. A limit for soil contamination meeting the extent practicable requirement can then be calculated by assuming an annual dose limit. A soil contamination limit, developed by this method, was applied by Chem-Nuclear Systems, Inc. to the decommissioning of an irradiation facility and was accepted by the NRC.

15509 (CONF-860203—, pp 161-170) **Legal and ethical issues raised in considering residential decontamination options for technologically-enhanced radioactive contamination.** Jensen, L.; Feldman, J. (Environmental Protection Agency, Chicago, IL). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

A large number of residential and commercial properties have been identified as having radioactive contamination resulting from disposal of radioactive residues from ore extraction operations, usually radium, thorium or uranium. The US Department of Energy has addressed many of the sites associated with the Manhattan Project through its FUSRAP program. But now, the US Environmental Protection Agency is faced with removal of residues from other operations under its Superfund program. High removal and disposal costs are often difficult to balance against the comparatively low value of properties affected. Soil screening techniques must be rapid and present a relatively high level of assurance that criteria are not exceeded. Yet, private lives are affected. Considerations in making cost-benefit decisions are discussed here.

15510 (CONF-860203—, pp 171-179) **Public information experience in the uranium mill tailings remedial action (UMTRA) project.** Meyer, H.R.; Skinner, D.J. (Chem-Nuclear Systems, Inc., Albuquerque, NM). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

To enhance public perception of the UMTRA Project remedial actions at some 23 sites in the US, an information program has been designed to demonstrate the small risk associated with the work in each community. An unusual aspect of this information program has involved a specific effort to educate listeners concerning the Health Physics terminology being used. The information program has been successful in reducing the level of public anxiety associated with UMTRA remedial action at the first Project site, and is currently being applied at several new sites.

15511 (CONF-860203—, pp 181-190) **Financial assurance for decontamination and decommissioning: a Texas perspective.** Rao, C.D.; Etter, S.D.; Dziuk, T.W. (Texas Dept. of Health, Austin). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Texas Department of Health (TDH) has the regulatory responsibility to ensure that funds are available for decontamination, decommissioning, and reclamation of uranium recovery facilities in Texas. Uranium recovery licensees are required to post financial security with the Agency for that purpose. Texas uranium facilities include (1) conventional surface mining and milling plants, including tailings ponds, and (2) in situ solution mining plants, each with somewhat different cost elements for decontamination, decommissioning, reclamation, and closure. Cost estimates for decontamination, decommissioning, and reclamation, along with a facility closure plan, are initially submitted to the Agency by the licensees. These are verified and compared with detailed independent cost estimates prepared by Agency staff. Significant differences between the two estimates are examined and resolved by negotiation and/or recalculation to the satisfaction of the state. The Texas philosophy for maintaining financial security permits flexibility in the closure plan without jeopardizing or compromising the ultimate long-term objectives of closure. Review of closure plans incorporates new technological developments In contrast, financial security is established expeditiously by applying the best available cost data to necessarily conservative estimates of the work involved. Financial security cost estimates are subject to annual review and adjustment.

15512 (CONF-860203—, pp 191-195) **Use of site groundwater investigations in the decontamination and decommissioning of nuclear facilities.** Molello, S.A. (GPU Nuclear Corp., Forked River, NJ). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

A major component of the environmental analysis process during the decontamination and decommissioning of nuclear facilities is the assessment of the subsurface for radiological contamination. The maximum value for efforts and dollars expended during such assessments is achieved when the site groundwater investigation is conducted in a carefully planned and systematic manner. Guidelines and instructions for the accomplishment of these investigations are presented, including: (1) an introduction explaining the needs for and uses of such investigations, (2) a step by step explanation of a desirable format for the design of site groundwater investigation work plans, and (3) the utilization of data obtained in the implementation of remedial or corrective actions, if necessary. Several topics related to these three areas are also discussed, including public relations and litigation.

15513 (CONF-860203—, pp 197) **Comparisons of passive environmental radon monitors (PERMs) and track etch (R) radon detectors during remedial actions at the Niagara Falls Storage Site.** Borden, W.C.; Kaye, M.E. (Bechtel National, Inc., Oak Ridge, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

During recent remedial actions for the US Department of Energy at its Niagara Falls Storage Site, in excess of 6000 curies of radioactive materials (thorium-230 and radium-226 in equilibrium with its particulate daughters) were slurry transferred approximately one mile to an engineered waste storage facility. During this transfer, radon-222 was released to the atmosphere. Off-site concentrations of radon-222 were monitored throughout a year's period with 30 PERM and 29 Track Etch (R) detectors. Of these 59 monitoring devices, 38 were arranged as paired stations providing 266 data points for comparative assessments. Detailed attention is given to environmental and topographical conditions that significantly effect detector performance, and that are unique to the northeastern US. Experimental data is presented that quantifies effects of climate changes, as well as detector response and integration capabilities. Conclusions point to the need for significant programmatic and siting changes.

15514 (CONF-860203—, pp 199-209) **Environmental monitoring requirements during remedial action and stabilization of uranium mill tailings (UMTRA project).** Skinner, D.J.; Meyer, H.R.; Hoffman, L.G. (Chem-Nuclear Systems, Inc., Albuquerque, NM). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Department of Energy is conducting remedial action at uranium mill sites which supplied uranium to the US government under the Manhattan Project. There are requirements to conduct an environmental monitoring program during actual remedial action. The purpose of the environmental monitoring program is to provide information and assurance to the DOE and the public that environmental releases, due to remedial action activities, are within applicable regulations and guidelines. A discussion of the generic program requirements including: radon monitoring, radionuclide particulate monitoring, water monitoring and environmental gamma dose assessment are reviewed. Specific results for the Canonsburg, PA and Shiprock, NM UMTRA sites, are briefly presented.

15515 (CONF-860203—, pp 211-216) **Radiological characterization of the Weldon Spring Quarry Weldon Spring, Missouri.** Hickey, C.R.; Glenn, R.D.; Christian, K.L. (Bechtel National, Inc., Oak Ridge, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Bechtel National, Inc., performed a radiological survey of the Weldon Spring Quarry (WSQ), Weldon Spring, Missouri in

1984 and 1985 as part of the US Department of Energy's Surplus Facilities Management Program. The WSQ is a 9-acre site that is presently used for storage of low-level radioactively contaminated soils, rubble, and equipment. The WSQ received these thorium-, radium-, and uranium-contaminated materials including rubble, equipment, and soils from 1959 to 1968. This survey consisted of beta-gamma and gamma measurements made at the ground surface, external gamma and radon rate measurements, and subsurface gamma loggings. In addition, surface and subsurface soils, surface water, groundwater, and sediment samples were collected and analyzed for thorium-230 and -232; radium-226, and -228; uranium-234, -235, and -238; and lead-210. Analyses of samples indicated concentrations of thorium-230, and -232; radium-226; and uranium-234, -235, and -238 in excess of the US Department of Energy remedial action guidelines. Several problems were encountered during this survey, including surveying on rough terrain, drilling into rubble, and severe weather conditions. This paper discusses the monitoring equipment and procedures used during the survey. In addition, solutions to several problems encountered will be described.

15516 (CONF-860203—, pp 217-225) **Environmental impacts of the release of a transuranic actinide, americium-241, from a contaminated facility.** Wang, J.; Merry-Libby, P. (Argonne National Lab., IL). Dec 1986. NTIS $23.00. File Number DE86900357. Contract W-31-109-ENG-38.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Americium-241 is widely used as a radiation source, but it also has some potential risk if taken into the body because of its high dose conversion factor. Although the radiotoxicity of americium-241 is small compared to other transuranic actinides, its effects on the reproductive system and on development of the placenta are more damaging than the effects of plutonium-239. In Ohio, a gemologist's laboratory was contaminated with americium-241. Prior to decontamination of the laboratory, potential radiological impacts to the surrounding environment were assessed. A hypothetical fire accident resulting in a unit release (1 curie) was assumed. Potential radiological impacts were simulated using an atmospheric dispersion and dosimetry model with local meteorological data, population census data, and detailed information regarding the neighborhood. The results indicate that there could have been a significant impact on nearby residents from americium-241 via atmospheric dispersion if a major catastrophic release had occurred prior to decontamination and decommissioning of the laboratory.

15517 (CONF-860203—, pp 227) **Review of current research into soil decontamination and volume reduction techniques for purposes of transportation and disposal.** Haywood, F.F. (Eberline Analytical Corp., Oak Ridge, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

In recent years, a number of soil decontamination studies have been carried out by investigators in the US and Canada. These investigations have included the segregation of potentially hazardous chemicals from uranium mill tailings, the use of various leaching agents for the selective removal of radium, thorium, and uranium from mine and mill tailings, the study of neutralization, fixation, and conditioning processes for tailings, the separation and removal of transuranium elements from contaminated soil and sediment, and finally studies of the cost effectiveness of various decontamination approaches. Remedial action programs for which soil decontamination may be an attractive alternative are those which include the cleanup of large open land areas since thousands of cubic years of material are generally involved. The practice of decontaminating or otherwise segregating contaminated and uncontaminated soil fractions before shipment to a final disposal site can only be done if it is economical to do so. This paper considers several techniques which have been reported in unclassified literature and includes a comparison of the authors' conclusions regarding the effectiveness of their investigations. The manuscript will include a comprehensive bibliography of references to techniques which appear to be feasible alternatives in remedial action programs.

15518 (CONF-860203—, pp 229-233) **TMI-2 post-accident dose reduction through coating removal.** Hinds, S.S.; Pavelek, M.D. II; Hoyt, K.R. (Bechtel National, Inc., Middletown, PA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

This paper describes the approaches used to define sources and to achieve both effective decontamination and dose reduction through coating removal from surfaces in the TMI-2 auxiliary and fuel handling building and reactor building. The testing, production rates, and lessons learned during surface removal operations from 30,000 ft^2 of epoxy coated concrete floors are discussed. Finally, the resulting post-decontamination exposure levels and recommendations for future work are presented.

15519 (CONF-860203—, pp 235-239) **Use of urethane foam in the decontamination and decommissioning of nuclear facilities.** Hermetz, R.E. (Monsanto Research Corp., Miamisburg, OH). Dec 1986. NTIS $23.00. File Number DE86900357. Contract AC04-76DP00053.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Urethane foam is being used in decontamination and decommissioning work in radioactively contaminated areas at Monsanto Research Corporation's Mound facility. Used in a two-step method, the foam is first sprayed onto the interior surfaces of contaminated gloveboxes, fixing residual contamination beneath the urethane. The foam is then used to package and stabilize gloveboxes inside standard transuranic shipping containers. The procedure reduces health and safety risks and has proven cost effective.

15520 (CONF-860203—, pp 241-250) **Remote methods for decontamination and decommissioning operations.** DeVore, J.R. (Oak Ridge National Lab., TN). Dec 1986. NTIS $23.00. File Number DE86900357. Contract AC05-84OR21400.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Three methods for the decontamination and decommissioning of nuclear facilities are described along with operational experience associated with each method. Each method described in some way reduces radiation exposure to the operating personnel involved. Electrochemical decontamination of process tanks is described using an in-situ method. Descriptions of two processes, electropolishing and cerium redox decontamination, are listed. A method of essentially smokeless cutting of process piping using a plasma-arc cutting torch is described. In one technique, piping is cut remotely from a distance using a specially modified torch holder. In another technique, cutting is done with master-slave manipulators inside a hot cell. Finally, a method for remote cutting and scarification of contaminated concrete is described. This system, which utilizes high-pressure water jets, is coupled to a cutting head or rotating scarification head. The system is suited for cutting contaminated concrete for removal or removing a thin layer in a controlled manner for decontamination.

15521 (CONF-860203—, pp 251) **Johnston Atoll site cleanup - some practical concerns.** Vesper, B.E.; Mohaupt, T.H.; Dooley, M.A.; Bramlett, E. (Armed Forces Radiobiology Research Institute, Bethesda, MD). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Johnston Island in the Pacific Ocean was contaminated as a result of weapons testing in the early 1960's. A recent cleanup project removed approximately 540 tons of actinide contaminated debris from a missile launch site. The site removal effort consisted of monitoring all debris for contamination levels, fixing contamination in place and packaging materials to meet DOT regulations for both land and water transportation. This report presents details of

this recent practical project in site decontamination and details decommissioning of an actinide only contaminated site.

15522 (CONF-860203—, pp 271-291) **Decontamination and decommissioning of extraction cell 3 at the West Valley Demonstration Project.** Jones, E.D. (West Valley Nuclear Services Co., Inc., NY). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

This paper describes the decontamination and decommissioning (D/D) of Extraction Cell 3 (XC-3) at the West Valley Demonstration Project. XC-3 is one of several cells in the former reprocessing plant required for future use in support of the solidification of high-level waste. The cell became radioactively contaminated during nuclear fuel reprocessing from 1966 to 1972. This report describes the work performed to accomplish the D/D objectives of removing existing piping and equipment from XC-3 and of reducing radiation and contamination levels to allow installation of equipment for the Liquid Waste Treatment System (LWTS). Contaminated debris and equipment inside the cell were removed, packaged and stored for future disposition. Interior surfaces (walls, floor, and ceiling) of the cell were then decontaminated to a radiation level that allowed entry without the use of protective clothing or respiratory protection.

15523 (CONF-860203—, pp 293) **Deconning during the 1984 H.B. Robinson steam generator replacement project.** Meyer, B.A. (Carolina Power & Light Co., New Hill, NC). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

In 1984 the H.B. Robinson Nuclear Plant replaced the nuclear supply system steam generators. Many deconning techniques and applications were used during this major year-long maintenance outage. Some of the deconning techniques used included an alumina grit blasting system; a high-temperature steam cleaning/vacuum cleaner an ultrasonic Freon degreaser; a sandblasting glove box; and soap, water, and elbow grease. Some of the specific deconning applications included the steam generator channel heads, the reactor refueling cavity, a variety of tools and equipment, and the complete general area of the reactor containment vessel. These and other deconning techniques and applications reduced the need for respiratory protection, reduced the exposure rates in work areas and, subsequently, workers' dose, decreased the personnel contamination events, and reduced the amount of radwaste generated.

15524 (CONF-860203—, pp 295) **Determination of U-238, Ra-226, and Th-232 by gamma-ray spectrometry in unprocessed soil samples.** Dendahl, K.H.; Brown, J.A. (Eberline Analytical Corp., Oak Ridge, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Following the excavation of open land areas during remedial action programs, it is frequently necessary to analyze soil samples which have not been processed. Typically, soil is placed in containers such as 0.5 liter plastic jars or 2 liter metal cans at the time it is collected. An analysis procedure for these samples has been developed with reference to counting standards in the same types of container. Information from the initial analysis is used in conjunction with near-surface in situ gamma-ray measurements over excavated areas to support the decision to backfill an area. Following this initial analysis, each sample is dried, pulverized and packed into a Marinelli beaker for final counting. A comparison of the results from both analyses shows the first analysis to be low by as much as a factor of 2. The principal reason for this effect is the presence of moisture in the original samples. The difference is most noticeable for low energy photons from Th-234 (U-238), at least for photons from Th-232 daughters. This paper will address the development of these techniques for analyses.

15525 (CONF-860203—, pp 297) **In situ monitoring technique for determining post remedial action concentrations of radium in soil.** Johnson, N.R.; Glenn, R.D. (Eberline Analytical Corp., Albuquerque, NM). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

There are several federal programs where action is being carried out to clean up or otherwise control residual radioactivity, at levels above current guidelines, which exists as a result of activities carried out during the early years of this nation's atomic energy program. At most of the sites which are candidates for clean up, the principal radionuclide of concern is Ra-226. Following excavation of open land areas, measuring the concentration of Ra-226 in soil samples from discrete locations or by indirect monitoring techniques. For application in remedial action programs, as in situ monitoring technique has been employed with favorable results. Instrumentation for this technique consists of a 2" x 2" NaI probe mounted on a wheeled dolly so that the detector is approximately 12" above the ground. Radiation levels are read out using a portable digital ratemeter/scaler. Readings with this device are representative of photons which reach the detector from a ground area subtended by projection of the cone shield side wall. This system was calibrated using facilities at the Department of Energy Technical Measurements Center, Grand Junction, CO. A series of measurements at this facility revealed a conversion factor which relates the response for Ra-226 in dry soil: Ra-226 $pCi/g = 1.06 \times 10^{-3}$ (cpm) - 2.94. The correlation coefficient was 0.99. This technique has been used extensively to predict the Ra-226 soil concentration averaged over individual 100 m^2 areas.

15526 (CONF-860203—, pp 301) **Radiological field survey problems & solutions.** Deming, E.J.; Boerner, A.J. (Oak Ridge Associated Universities, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Situations often arise during radiological field surveys which require the health physicist to improvise and/or make spot decisions. At times these situations can be humorous, but they can also present hazards more serious than normal radiological considerations. This presentation will depict various problematic situations encountered by Oak Ridge Associated Universities Radiological Site Assessment Program in the course of performing field environmental surveys. Detailing these potential hazards can alert other field survey groups to problems they may encounter.

15527 (CONF-860203—, pp 303-310) **Measurement of radon and radon progeny in radium contaminated residential properties in New Jersey.** Eng, J.; White, A.D.; Hopper, R. (New Jersey Dept. of Environmental Protection, Trenton). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

As part of a radiological investigation and remedial action program, 45 homes affected by radium contaminated soil were monitored quarterly since Fall 1983. Elevated levels of radon and radon progeny were found in homes built on former radium contaminated landfill areas. Radon progeny levels in excess of 0.1 Working Levels (WL) were lowered by installing ventilation systems in the basement. The remaining homes with radon progeny levels less than 0.1 WL were not remediated. Both sets of homes were monitored quarterly through 1985. Radon measurements were made over 3-5 days with the activated carbon canister manufactured by the NJ Department of Environmental Protection based on a US Department of Energy's Environmental Measurements Laboratory design. Radon progeny measurements were made over 5-7 days with the Radon Progeny Integrating Sampling Unit (RPISU) designed by the US Environmental Protection Agency. This paper will evaluate the impact of seasonal and home use factors on radon, radon progeny and equilibrium factor.

15528 (CONF-860203—, pp 321) **Johnston Atoll cleanup - accurate monitoring for actinides.** Vesper, B.E.; Mohaupt, T.H.; Dooley, M.A.; Bramlett, E. (Armed Forces Radiobiology Research Institute, Bethesda, MD). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

A recent cleanup of actinide contamination was conducted at a site on Johnston Island in the Pacific Ocean. Extensive effort was necessary to quantify specific nuclide concentrations and to determine the total actinide levels as required for shipment to a burial site. Initial monitoring of site debris was made with a FIDLER probe connected to a log-linear rate meter to roughly determine the host spots. Counting was then done for quantitative actinide levels via a high intrinsic Germanium detector combined with a multichannel analyzer. Isotopic analysis and actinide levels were then determined by feeding MCA data into a computer. This report reviews the approaches to some of the unique challenges encountered in this cleanup effort.

15529 (CONF-860203—, pp 331-337) **Radioactive waste assay at the West Valley Demonstration Project.** Marchetti, S.; McVay, C.W.; Stimmel, J.R. (West Valley Nuclear Services Co., Inc., NY). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The decontamination and decommissioning of the West Valley nuclear reprocessing plant is generating a large variety of types of radioactive waste which require classification in accordance with 10CFR61. A radioactive waste assay system has been developed to efficiently assay and classify this radioactive waste. The waste is assayed by segmented gamma counting, passive neutron counting, dose rate conversion, and/or laboratory analysis. The system is capable of handling all the waste from generated at the West Valley Demonstration Project. The system produces a list of nuclides present with their concentrations and determines the classification of the waste based on the criteria contained in 10 CFR 61.

15530 (CONF-860203—, pp 339-346) **Comparison of the response of a NaI scintillation crystal with a pressurized ionization chamber as a function of altitude, radiation level, and Ra-226 concentration.** Provencher, R.; Smith, G.; Borak, T.B.; Kearney, P. (Colorado State Univ., Fort Collins). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Grand Junction Uranium Mill Tailings Remedial Action-Radiological Survey Activities Group (UMTRA-RASA) program employs a screening method in which external exposure rates are used to determine if a property contaminated with uranium mill tailings is eligible for remedial action. Portable NaI detectors are used by survey technicians to locate contaminated areas and determine exposure rates. The exposure rate is calculated using a regression equation derived from paired measurements made with a pressurized ionization chamber (PIC) and a NaI detector. During July of 1985 extensive measurements were taken using a PIC and a NaI scintillator with both analogue and digital readout for a wide range of exposure rates and at a variety of elevations. The surface soil was sampled at most of these locations and analyzed for ^{226}Ra. The response of the NaI detectors was shown to be highly correlated to radiation level but not to ^{226}Ra concentration or elevation.

15531 (CONF-860203—, pp 347-358) **Using a HPGe detector and micro R meter for quick and simple estimate of radionuclide activity in LSA shipping containers.** Robinet, M.J.; Justus, A.L. Wynveen, R.A. (Argonne National Lab., IL). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Shippers of low specific activity (LSA) waste are required by both waste receivers and Department of Transportation (DOT) regulations to provide an estimate of radionuclide activity in each container. In their work, a high resolution HPGe detector was used to measure the ^{226}Ra and daughters gamma flux from 90 ft^3 LSA waste containers. The detector was calibrated with a radium point source of known activity. To calculate the radium activity in a container, the gamma flux reaching the detector from successive slices of the container was numerically integrated over its dimensions. The counting time for each container initially required several hours. However, by constructing a graph of container radium activity versus average exposure rate (μR/h) at container surfaces, a measurement could be made in a few minutes and the activity read from the graph. Results are estimated to be accurate to at least an order of magnitude. Where hundreds of containers are involved, the time and cost saved by this technique can be significant.

15532 (CONF-860203—, pp 359-368) **Rapid estimation of ^{226}Ra in soil for the Grand Junction RASA/UMTRA Project.** Kark, J.B.; Borak, T.B.; Kearney, P.D.; Rood, A.S. (Colorado State Univ., Fort Collins). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Radiological Survey Activities (RASA) Group of the Health and Safety Research Division at Oak Ridge National Laboratory (ORNL) is an Inclusion Survey Contractor (ISC) for the Uranium Mill Tailings Remedial Action Program (UMTRAP). The purpose of the ISC is to survey designated sites potentially contaminated with radioactive material originating from the 24 inactive uranium mill sites and make recommendations as to whether the site should be included in or excluded from further consideration by UNTRAP. An important aspect of the program is a prompt and inexpensive estimation of Radium-226 (^{226}Ra) concentration in soil samples. A large sodium iodide (NaI) well crystal coupled to a multichannel analyzer is used to count soil samples. Count data are currently analyzed with an algorithm that utilizes three regions of interest (ROI). A lack of agreement was observed when samples were also analyzed with lithium-drifted germanium (GeLi) spectrometers. The average estimate of ^{226}Ra obtained using the current algorithm was 19% greater than the GeLi determination. Some possible reasons for these differences were examined. In 8.5% of the samples, the relative concentration of Cesium-137 (^{137}Cs) was highly correlated to the extent of error. Using alternative analysis techniques, the error for ^{226}Ra estimations may be reduced by a factor of 2 for randomly selected samples and by a factor of 4 for samples containing high concentrations of ^{137}Cs relative to the concentrations of ^{226}Ra.

15533 (CONF-860203—, pp 379-388) **Health physics experience in the decontamination and decommissioning of the 203-S, 204-S, and 205-S uranium nitrate hexahydrate purification and waste tank car unloading facilities.** Rasmussen, O.R. (Rockwell Hanford Operations, Richland, WA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The obsolete 203-S, 204-S, and 205-S uranium nitrate hexahydrate purification and storage facility and the radioactive waste tank car unloading equipment in the 200 West Area of the US Department of Energy Hanford Site were decontaminated and decommissioned. Aboveground facilities were dismantled, and the area was backfilled with clean fill over underground concrete structures. The site was released as a radiologically clean area with underground contamination. The 13-month project was completed by Rockwell Hanford Operations decontamination and decommissioning forces three months ahead of schedule and $275,000 under budget. Important health physics aspects of the project included hydraulic sluicing of vessels to reduce radioactive material inventories, intact transport, fill and burial of large vessels to minimize hands-on dismantling, and the use of special containment techniques for pipe dismantling, including pipe drainage with explosive-activated tees, and pipe cutting and sealing with hydraulic crimping equipment.

15534 (CONF-860203—, pp 389-399) **Placement of the radiochemical processing plant at Oak Ridge National Laboratory into a safe standby condition.** Holladay, D.W.; Bopp, C.D.; Farmer, A.J.; Johnson, J.K.; Miller, C.H.; Powers, B.A.; Collins, E.D. (Oak Ridge National Lab., TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Extensive upgrade, cleanup, and decontamination efforts are being conducted for appropriate areas in the Radiochemical Processing Plant (RPP) with the goal of achieving safe standby condition by the end of FY 1989. The ventilation system must maintain containment thus, it is being upgraded via demolition and replacement of marginally adequate ductwork, fans, and control systems. Areas that are being decontaminated and stripped of various services (e.g., piping, ductwork, and process tanks) include hot cells, makeup rooms, and pipe tunnels. Operating equipment that is being decontaminated includes glove boxes and hoods. Replacement of the ventilation system and removal of equipment from pipe tunnels, cells, and makeup rooms are accomplished by contact labor by workers using proper attire, safety rules, and shielding, Removal of contaminated ductwork and piping is conducted with containment enclosures that are strategically located at breakpoints, and methods of separation are chosen to conform with health physics requirements. The methods of cutting contaminated piping and ductwork include portable reciprocating saws, pipe cutters, burning, and plasma torch. Specially designed containment enclosures will be used to prevent the spread of radioactive contamination while maintaining adequate ventilation.

15535 (CONF-860203—, pp 403-405) **Health physics or industrial hygiene.** Allen, J.K. (VIKEM Industries, Inc., Newburyport, MA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

With the continuing addition to the list of substances exhibiting carcinogenicity, the working health physics individual is being increasingly faced with situations where knowledge of industrial hygiene practices is necessary to insure protection of workers under his control. The problems will continue to multiply as events such as decommissioning of entire facilities and the advent of new decontamination and radwaste processing methods introduces a variety of new substances to the inventory of hazardous materials present in the working environment. A variety of specific situations will be discussed illustrating scenarios where industrial hygiene protocols must be implemented to insure complete safety for workers.

15536 (CONF-860203—, pp 407-416) **Training requirements for health physicists in the decontamination/decommissioning field.** Copenhaver, E.D.; Parzyck, D.C. (Oak Ridge National Lab., TN). Dec 1986. NTIS $23.00. File Number DE86900357. Contract AC05-84OR21400.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

While a significant decrease in the number of new facilities requiring health physics surveillance has occurred in the past decade, there has been a tremendous increase in the need for health physicists to fill regulatory requirements at existing facilities and the Decontamination and Decommissioning requirements of older facilities nearing the end of their operational lifetime. There is a continuing long-term need to provide trained health physicists with the special skills to meet these requirements. Decontamination and decommissioning programs require both basic and specialized health physics activities to be performed (1) to evaluate the radiation environment of the facility under consideration, (2) to establish the standards to which cleanup activities must be pursued, and (3) to adequately protect the personnel involved in the cleanup. Performance-based training, based on job task analysis, is an appropriate way to define the different types of health physics expertise required for D & D programs. Materials have been developed to describe potential job requirements in the radiation protection field, and the appropriate training goals to meet these requirements.

15537 (CONF-860203—, pp 417-422) **Site clean-up requirements: where does one dispose of dirt?.** Feldman, J. (Environmental Protection Agency, New York, NY). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Under its Superfund program the US Environmental Protection Agency (EPA) has committed itself to remediate certain residential and commercial properties impacted by an accumulation of indoor radon or thoron resulting from deposition of contaminated dirt. A case in point: The State of New Jersey now has a number of sites contaminated with the residues of radium or thorium extraction operations. The residues (dirt) were removed from the original operations areas and used as landfill, often in locations which are now around houses or other buildings. EPA's soil contamination limits for radium or thorium dictate that remediation efforts consist of removal of that fill. This solution presents the problem of disposing of large volumes of marginally radioactive materials. Options which recognize the present lack of low-level radioactive waste disposal facilities are examined here.

15538 (CONF-860203—, pp 423-429) **Decontamination/decommissioning of mixed hazardous and radioactive waste disposal sites.** Ferguson, R.R.; Jacobs, D.G.; Kimbrough, C.W. (H & R Technical Associates, Inc., Oak Ridge, TN). Dec 1986. NTIS $23.00. File Number DE86900357. Contract AC05-84OR21400.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The production and research facilities operated for the US Department of Energy have generated a variety of solid and liquid wastes that contain both chemically hazardous and radioactive materials. In the past, regulations and waste management practices for radioactive wastes were developed independently from those for chemically hazardous wastes. Before implementation of the Resource Conservation and Recovery Act, the emphasis placed on management of hazardous wastes at facilities that handled both types of wastes was significantly less than the emphasis placed on management of radioactive wastes. Thus, inactive disposal sites that may be releasing inconsequential amounts of radioactivity to the environment may be releasing potentially significant amounts of chemically toxic heavy metals and organic compounds. In many instances, past disposal practices may dictate that the wastes associated with these sites be removed from current locations, treated to reduce toxicity, and disposed of in a more stable environmental setting. This paper outlines and describes the regulatory framework for site remediation and emphasizes how the concerns for health physics and occupational safety and health influence implementation.

15539 (CONF-860203—, pp 431-436) **Laboratory protocol for co-contaminated waste.** Kharkar, D.P.; Rodgers, D.; Penfold, L.; Dunstan, G.; Leventhal, L. (EAL Corp., Richmond, CA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The decommissioning of the inactive disposal sites such as uranium mill tailings, fuel processing plants, waste storage areas and decontamination of structures, equipment, laboratories, etc., generate hazardous substances containing varying amounts of radioactivity. The enactment of environmental legislation and regulations requires that environmentally responsible actions be taken to identify and eliminate the potential hazards resulting from the waste materials. A special handling procedure has been developed for screening, preparing, analyzing and disposing of radioactive samples undergoing hazardous waste characterization, i.e., co-contaminated samples. This paper addresses three principal concerns - laboratory compliance with State and Federal laws affect handling and release of radioactivity to uncontrolled areas, health and safety of laboratory workers, and handling practices that insure the laboratory's continued ability to perform environmental level radioactive analyses.

The analytical procedures used for co-contaminated samples are also discussed.

15540 (CONF-860203—, pp 437-442) **Disposal of slightly contaminated radioactive wastes from nuclear power plants.** Branagan, E.F. Jr.; Congel, F.J. (Nuclear Regulatory Commission, Washington, DC). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Current NRC regulations, with one exception, do not provide minimum levels of radioactivity in solid wastes which may be disposed of in a manner other than as radioactive waste. The exception (Title 10 Code of Federal Regulations Part 20.306) allows licensees to dispose of specified concentrations of tritium and carbon-14 used in liquid scintillation counting and in animal tissue without regard to radioactivity. However, this exception is of minimal use to nuclear power plant licensees. Current NRC regulations require that licensees dispose of even very slightly radioactively contaminated solid materials, with little flexibility as to the small quantities involved, at licensed low-level waste disposal sites or on a case-by-case basis pursuant to 10 CFR 20.302. On February 24, 1983 the NRC staff published Office of Inspection and Enforcement Information Notice No. 83-05, Obtaining Approval for Disposing of Very-Low Level Radioactive Waste - 10 CFR Section 20.302. Since that time, the staff has reviewed and approved about 20 requests for disposal of slightly contaminated radioactive materials. This paper describes the characteristics of the disposed wastes, the review process and the staff's dose guidelines.

15541 (CONF-860203—, pp 443-457) **Feasibility of centralizing disposal and processing facilities for low-level biomedical waste.** Osborne, T.W.; Terpilak, M.S.; Tupin, E.A. (RSO, Inc., Laurel, MD). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Research efforts were designed to examine the feasibility of a centralized processing facility for low level radioactive waste materials. The scope of the proposed facility was to provide a regional commercial processing service to medicine and biomedical research institutions who are unable to perform waste processing or treatment for themselves. The results of a literature search has provided an extensive description of low level wastes on a national basis. Sufficient information is now available concerning waste types, physical and chemical forms, radionuclide types and quantities, and volumes on a regional basis to support the operation of a reprocessing facility. Specifically, the total low level biomedical waste volume generated in the US during 1980 was approximately 660,000 cu ft. Commercial reprocessing operations which could handle approximately 81% of this volume and achieve a gross effective volume reduction ratio of 4 to 1 (including materials totally disposed of by the reprocessor) would be supported by a 15 million dollar annual industry. New technologies exist which are not currently used in commercial operations. There is an excellent potential for their use to provide an increase in the volume reduction rates on a cost effective basis. Current volume reduction rates of 3-5:1 could be increased to 10:1.

15542 (CONF-860203—, pp 459) **Overview of the surplus facilities management program.** Miller, C.E. Jr.; Baumann, B.L. (Dept. of Energy, Richland, WA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

In 1978, the Department of Energy established the Surplus Facilities Management Program (SFMP) to provide for the safe maintenance and eventual disposal of nuclear facilities used in early defense and nuclear energy programs. SFMP's current inventory includes approximately 300 shutdown, radioactively contaminated facilities located throughout the US and Puerto Rico. SFMP's responsibilities include maintenance and surveillance of facilities awaiting decommissioning, planning, and decommissioning implementation. Some examples of major SFMP decommissioning projects underway include: the Shippingport Atomic Power Station in Shippingport, Pennsylvania; the eight plutonium production reactors on the Hanford Site near Richland, Washington; and the Weldon Spring Site located near St. Louis, Missouri. This paper presents an overview of the Surplus Facilities Management Program and highlights its major decommissioning projects.

15543 (CONF-860203—, pp 461-469) **Intact decommissioning option for nuclear power plants.** Ostrow, S.L.; Oztunali, O.I.; Grant, T.J. (Ebasco Services, Inc., New York, NY). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Intact decommissioning has been proposed as an alternative method for decommissioning nuclear power plants complying with NRC license termination requirements as set forth in 10 CFR 50 and Regulatory Guide 1.86. Under this method, after the fuel and radioactive liquid and wastes are removed, highly radioactive systems and components, such as the reactor vessel and internals and the primary coolant system, would be sealed inside a designated boundary (e.g., the containment building) and left indefinitely. Radioactive materials outside the intact decommissioning boundary would be removed. Minimization of preparatory work, no consolidation of radioactive components in a particular location, and no maintenance or surveillance of the decommissioned facility distinguish this from the entombment option. The associated occupational radiation exposure should be significantly lower, and the public exposure no greater - and quite likely less - than the currently favored decommissioning method, immediate dismantlement. This paper presents the results of a study, sponsored by the National Environmental Studies Project of the Atomic industrial Forum (AIF/NESP), examining the viability and radiological consequences of intact decommissioning.

15544 (CONF-860203—, pp 471-485) **Decontamination of the chemical crane room and decontamination and decommissioning of the extraction chemical room at the West Valley Demonstration Project.** Phillips, E.C.; Golden, M.P. (West Valley Nuclear Services Inc., NY). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

This paper describes the decontamination of the Chemical Crane Room (CCR) of the West Valley Plant and the Extraction Chemical Room (XCR) from radioactively contaminated conditions to essentially shirt sleeve environments. In both cases, subsequent use re-contaminated the rooms. Prior to decontamination, general exposure rates in the CCR were 50 to 100 mR/hr with hot spots as high as 2000 mR/hr. Smearable levels on the floor were in the range of 10^5 to 10^6 dpm per 100/cm^2. Respiratory protection was mandatory for entry. In the Extraction Chemical Room (XCR) prior to decontamination and decommissioning (D/D), radiological surveys indicated a maximum radiation field of 5 mR/hr, due to sources internal to the room, and 20,000 dpm beta/100 cm^2 surface contamination. A radiation source external to the XCR caused a hot spot with a 9 mR/hr exposure rate inside the XCR. The CCR, located at the north end of the Chemical Process Cell (CPC) is for the storage and servicing of two bridge cranes used in the CPC. Decontamination and exposure reduction in the CCR has been completed using vacuum cleaning, damp wipe down, and surface grinding followed by shielding and painting. The decontamination and decommissioning of the Extraction Chemical Room (XCR), located on the fifth floor elevation (160') of the reprocessing plant at the WVDP, has been completed. D/D operations included removal of piping, tanks, supports, and equipment to provide a clean work area of about 3000 square feet and 17 feet high.

15545 (CONF-860203—, pp 487-495) **Decontamination and decommissioning of contaminated surplus facilities in the 200 areas of the Hanford site.** Speer, D.R.; Heine, W.F. (Rockwell Hanford Operations, Richland, WA). Dec 1986. NTIS $23.00. File Number DE86900357. Contract AC06-77RL01030.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Surplus Facilities Management Program (SFMP) of Rockwell Hanford Operations (Rockwell) is currently engaged in decontamination and decommissioning (D & D) of contaminated surplus facilities in and around the 200 Areas of the Hanford Site. These contaminated surplus facilities range in size and complexity from small wood-frame buildings to an 83,000 ft^2 reprocessing facility with monolithic concrete shielding walls and extensive residual radioactive contamination. The current inventory of facilities includes 3 major processing facilities, 8 large support buildings, 14 small support buildings, and 30 tanks, vaults, basins, and stacks. Completed activities include the decontamination or dismantlement of 9 facilities. Part of this involved the intact transport of four 50,000-gal tanks from a facility to a burial ground with subsequent filling and burial of the tanks. Work underway includes the decontamination, dismantlement, and entombment of a fuel reprocessing pilot plant and the decontamination of a plutonium processing facility with a goal of returning the processing facility to beneficial use. Thus far, the decontamination efforts have resulted in a significant reduction in hazards associated with safe storage of the 9 completed facilities as well as cost avoidances associated with returning buildings and equipment to beneficial use.

15546 (CONF-860203—, pp 497-504) **Remedial action of radium contaminated residential properties.** White, D.; Eng, J. (New Jersey Dept. of Environmental Protection, Trenton). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Since November 1983, the New Jersey Department of Environmental Protection (NJDEP) and the US Environmental Protection Agency (USEPA) have been in the process of identifying prc_ ' es in Montclair, Glen Ridge and West Orange, New Jersey, which were built over radium contaminated soil landfilled areas. Elevated indoor radon concentrations prompted the Centers for Disease Control (CDC) to issue a health advisory which included permanent remediation of radon progeny levels in excess of 0.02 Working Levels within two years of discovery. In order to expedite remedial action, NJDEP undertook a ten million dollar cleanup program. Remedial Action at the 12 residential properties encountered some unanticipated problems despite the efforts of numerous government agencies and their contractors to characterize the contamination as much as possible prior to remediation. Some of the unanticipated issues include contamination from other radionuclides, underestimation of removal volumes, and controversy over the transportation and disposal of the radium contaminated soil at a commercial facility in Nevada. This paper will review the approach taken by NJDEP to the remedial action for radium contaminated soil, discuss some of the issues encountered during the remedial action, and provide post remedial action data.

15547 (CONF-860203—, pp 505-512) **Experience gained during remedial action at residential properties contaminated with Th-232 and Ra-226.** Beck, W.L.; Lynt, R.; Lazo, E.N.; McDougall, M.R. (Bechtel National, Inc., Oak Ridge, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Seventeen residential properties contaminated with Th-232 and Ra-226 were decontaminated and restored by Bechtel National, Inc., during 1984 as part of the US Department of Energy's Formerly Utilized Sites Remedial Action Program. The extent of contamination varied from only a few cubic yards of material in the edge of one lawn to extensive contamination around foundations and under basement floors. Three unusual case histories will be described in detail. In the first case, a few cubic yards of contamination were expected, but more than 100 cubic yards were found. In Case 2, contamination was found under the floor of an addition to a house. Case 3 involved a home built on a lot where contaminated soils had been used as fill material to depths of up to 10 feet. The remedial action included the removal of the basement, including the floor slab and foundation. This paper will provide details about several lessons learned during remedial action at residential properties: (a) radiological characterization surveys must be thorough; (b) interviews with owners can provide helpful information about unusual or unexpected contamination problems; (c) radiological monitoring during construction is necessary for efficient and thorough remedial action; and (d) good public relations are an important element of residential remedial action projects. While these lessons may seem to be common sense items, the circumstances that require their use are often very subtle. As the case histories show, successful remedial action requires constant vigilance and careful attention to details.

15548 (CONF-860203—, pp 513-522) **Decontamination and decommissioning of a luminous dial painting facility: radiological characterization, segregation and disposal of building materials.** Ed, D.; Chu, L.; Chepulis, P.; Hamel, M. (Illinois Dept. of Nuclear Safety, Springfield). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The State of Illinois, Department of Nuclear Safety, has decontaminated and decommissioned the defunct Luminous Processes, Inc. facility located in Ottawa, Illinois. The state's overall experience throughout the project is generally described, with particular emphasis given to the radiological characterization (Ra-226+progeny and H-3) and subsequent segregation and disposal of building materials as either radioactive or non-radioactive. Experiences involving direct application of health physics principles (criteria selection, sampling schemes, analytical techniques, data reduction, quality assurance) are discussed. Experiences involving other health physics regimens (personnel protection and dosimetry, environmental monitoring) as well as social sciences and economic considerations (public perception, media relations, political involvement, contractor interactions, fiscal management) are discussed only insofar as they affect the radiological characterization, segregation and disposal processes.

15549 (CONF-860203—, pp 523-531) **Correlation between gamma radiation levels and soil radium concentrations at the Edgemont uranium mill site.** Wallace, R.G.; Reed, R.P.; Polehn, J.L.; Wilson, G.T. (Tennessee Valley Authority, Muscle Shoals, AL). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Tennessee Valley Authority's uranium mill in Edgemont, South Dakota is being decommissioned. Approximately 4 million tons of contaminated tailings, building equipment, and contaminated soil and debris on the mill site will be removed to the disposal site located approximately 3 kilometers to the southeast. To minimize recontamination of cleaned areas, tailings removal will progress from the northwest corner to the southeast corner of the mill site. As specific areas are cleaned, surveys will be conducted to determine if the concentrations of radium-226 in soil are within the limits outlined in 40 CFR, Part 192. Conformance with the criteria will be demonstrated by a gamma survey of the area employing the differential, or delta-measurement, technique. This technique involves fitting the detector with a base and a receptacle for a removable high-density filter. By making measurements with and without the filter in place, a gamma radiation level proportional to the radium-226 concentration in soil can be determined. This paper describes the results obtained in the development of the correlation between the gamma survey measurements and the soil radium concentrations.

15550 (CONF-860203—, pp 533) **Analysis of uranium and thorium contaminated soils during a cleanup and interment operation.** Cole, L.W.; Bollenbacher, M. (Aerojet Heavy Metals Co., Jonesborough, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

At the Aerojet Heavy Metals Company facility near Jonesborough, Tennessee, a remedial cleanup operation was completed

during September, 1985. This operation involved burying approximately 550,000 ft^3 of soil contaminated with uranium and thorium. Approximately 120,000 ft^2 of area was cleared of the contaminated soil. To maintain a reasonable construction pace, it was necessary to complete the analysis very rapidly. Only one gamma spectroscopy system was available to perform the analysis. This paper discussed the procedure followed during the remedial operation. Counting times were kept short by using the largest sample mass in the chosen sample container, having a relatively high efficiency detector, and standardizing on the low energy x-rays of Thorium-234 and Protactinium-234. Counting accuracy of 20% at the 95% confidence level was achieved in counting times of 500 to 1000 seconds for levels of 30 pCi/g of Uranium-238 and 5 pCi/g of Thorium-232. The analytical procedure was able to keep up with the construction effort.

15551 (CONF-860203—, pp 535) **Idaho National Engineering Laboratory release criteria for decontamination and decommissioning.** Dolenc, M.R.; Case, M.J. (EG & G Idaho, Inc., Idaho Falls). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Criteria have been developed for release of Idaho National Engineering Laboratory (INEL) facilities and land areas following decontamination and decommissioning (D & D). Decommissioning release criteria in the form of dose guidelines were proposed by the US Nuclear Regulatory Commission as early as 1980. These criteria were used on an interim basis for INEL D & D projects. However, dose guidelines alone do not adequately cover the criteria necessary to release sites for unrestricted use. In actual practice, other parameters such as pathways analyses, sampling and instrumentation techniques, and implementation procedures are required to develop the basis for unrestricted release of a site. Thus, a rigorous approach for evaluating these other parameters is needed to develop acceptable D & D release criteria. Because of the complex and sensitive nature of the dose and pathways analyses work, a thorough review by experts in those respective fields was desired. Input and support in preparing or reviewing each part of the criteria development task was solicited from several DOE field offices. Experts were identified and contracted to assist in preparing portions of the release criteria, or to serve on a peer-review committee. Thus, the entire release criteria development task was thoroughly reviewed by recognized experts from each DOE field office, to validate technical content of the INEL site-specific document.

15552 (CONF-860203—, pp 537) **Decontamination of an Americium-241 site.** Murphy, G.L.; Deming, E.J.; Caniano, R.J.; Emswiler, T.R.; Kirsch, G.E. (Oak Ridge Associated Universities, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

A rural residence was modified for operation as a hot lab with glove box capabilities designed to handle up to 25 Ci of Americium-241 in the powder oxide form. The facility operated under an NRC license for over ten years, when the license was amended for storage of contaminated materials only. A 1983 site survey conducted by Oak Ridge Associated Universities Radiological Site Assessment Program (ORAU/RSAP) indicated radioactive contamination present in the environment (soils and groundwater) and in unrestricted areas of the house and unattached garage. The site was declared an imminent hazard by US Nuclear Regulatory Commission (USNRC III), and the facility was closed pending decontamination under the Environmental Protection Agency (EPA) superfund. This paper will demonstrate that a cooperative effort between USNRC (III), EPA, Department of Energy (DOE), Battelle-Columbus Laboratory, and ORAU/RSAP resulted in an efficient and effective decontamination of the site. The co-operative effort enabled many problems to be overcome, and resulted in the clean-up completed under budget and on schedule.

15553 (CONF-860203—, pp 539-542) **Inventory of sites used to develop residual radioactivity criteria.** Ronca-Battista, M.; Hardeman, J.C. Jr. (Environmental Protection Agency, Washington, DC). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The US Environmental Protection Agency (EPA), in conjunction with the National Conference of Radiation Control Program Directors (CRCPD), has compiled an inventory of never licensed or otherwise poorly documented sites that may be contaminated with radioactive materials. This effort is in support of the EPA's development of radiation protection criteria for residual radioactivity at decommissioned sites. The inventory will help to establish the range of circumstances for which criteria are needed, as well as the suitability of candidate criteria for actual situations. The information will also be used to develop model sites and facilities for analyzing technical and economic feasibility of residual radioactivity criteria and to assess costs and benefits of alternate criteria. Relevant information about each site, such as radionuclides, waste forms, and quantities present will be included in the inventory when such information is available. The CRCPD has requested that each State radiation control agency furnish the information for the inventory. The inventory supplements the relatively extensive documentation of sites regulated by Federal or State agencies with information on old or unlicensed sites, such as old waste storage sites or radium ore processing facilities.

15554 (CONF-860203—, pp 543-551) **Database construction for assessment of chronic radionuclide releases.** Hively, L.M.; Sjoreen, A.L.; Bledsoe, J.L. (Oak Ridge National Lab., TN). Dec 1986. NTIS $23.00. File Number DE86900357. Contract AC05-84OR21400.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Oak Ridge National Laboratory (ORNL) has developed a comprehensive dose/risk assessment methodology, CRRIS (Computerized Radiological Risk Investigation System), for assessment of atmospheric radionuclide releases (e.g., during decontamination and decommissioning). Radiological effects are calculated for direct atmospheric and ground exposure and for consumption of contaminated agricultural products. Previously, population and agricultural data for CRRIS were tabulated on 1/2-degree square grid cells. This coarse resolution resulted in anomalies such as population in water bodies, agricultural production in city centers, and nonconservation of population over the assessment grid. An even finer mesh (2-minute square grid) is inadequate in densely populated cities where 20,000 or more people live in a square block. These difficulties are overcome by a higher resolution technique using US Census Bureau population data at the most detailed [enumeration district (ED)] level available and by excluding population from unpopulated areas (e.g., water bodies). Agricultural data are available at only the county level and are apportioned to the ED grid according to farm population, conserving the original data. This paper discusses the database construction using Tennessee as an illustration.

15555 (CONF-860203—, pp 553-561) **Use of computerized, 3-dimensional solids modeling and data base management to support radiation mapping and ALARA planning.** Schauss, R.D.; Slobodien, M.S. (Nuclear Information Sciences Co., Middletown, PA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The RADiation Mapping and ALARA Planning System (RADMAPS) under development by GPU Nuclear Corporation in conjunction with Construction Systems Associates, Inc., integrates computerized solids modeling and data base management to provide an automated, integrated systems solution to the problems associated with acquiring, managing, and communicating plant radiological data at nuclear facilities. This presentation describes the

status of the RADMAPS development and outlines plans for future expansion.

15556 (CONF-860203—, pp 563) **Health physics and operational experience gained from slurry transfer of wastes containing 780 curies of radium-226.** Borden, W.C.; Land, R.R. (Bechtel National, Inc., Oak Ridge, TN). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

During remedial action at the DOE Niagara Falls Storage Site 3.5 million kilogram (3891 ton) of uranium ore residues (code named K-65 during the Manhattan Project) were slurry transferred about one mile from a concrete water tower to an engineered waste containment facility. This operation presented a number of unusual health physics problems, mandating special handling, measurement, and exposure control methodologies. Principles among these were: (1) a specific activity of 220,000 pCi/gm; (2) open air concentrations of radon-222 of up to 60,000 pCi/l; (3) radon concentrations inside the tower of 1,700,000 pCi/l; (4) exposure rates of up to 350 mR/hr; (5) widely varying climatic conditions; and (6) working atop a 165 foot tall, 40 foot diameter, structure in these conditions. This paper will describe the transfer operation, its problems, problem solutions, and successes. Detailed attention is given to personnel and environmental monitoring, as well as contamination and exposure control methodologies. Operations concluded with the K-65 residues stored in an environmentally stable condition, less than 10 man-rem of worker exposure, and average off-site radon-222 concentrations of less than 0.3 pCi/l above background.

15557 (CONF-860203—, pp 565-573) **Assurance Program for Remedial Action (APRA) microcomputer-operated bibliography management system.** Stenner, R.D.; Washburn, D.K.; Denham, D.H. (Pacific Northwest Lab., Richland, WA). Dec 1986. NTIS $23.00. File Number DE86900357. Contract AC06-76RL01830.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Pacific Northwest Laboratory (PNL) provided technical assistance to the Office of Operational Safety (OOS) in developing their Assurance Program for Remedial Action (APRA). The APRA Bibliography Management System (BMS), a microcomputer-operated system designed to file, locate and retrieve project-specific bibliographic data, was developed to manage the documentation associated with APRA. The BMS uses APRABASE, a PNL-developed computer program written in dBASE II/sup (b)/ language, which is designed to operate using the commercially available dBASE II database software. This paper describes the APRABASE computer program, its associated subprograms, and the dBASE II APRA file. Although the BMS was designed to manage APRA-associated documents, it could be easily adapted for use in handling bibliographic data associated with any project.

15558 (CONF-860203—, pp 575-578) **Decommissioning the world's first commercial nuclear fuel reprocessing facility.** Marchetti, S.; Hoffman, D. (West Valley Nuclear Services Co., Inc., NY). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

An overview of the West Valley Demonstration Project is presented. Nuclear waste forms managed at the project premises include high level liquid and solid waste, spent fuel, transuranic and low level wastes. The key purpose of this paper is to outline the decontamination and decommissioning program and to provide a pictorial description of associated techniques developed here. The principal goal of the Project is to vitrify more than 2 million liters of liquid high level waste. This is addressed and a pictorial presentation of vitrification equipment is included.

15559 (CONF-860203—, pp 579) **Final resting place of a cesium 137 gauge.** McNees, J.L.; Whatley, K.E.; Maryland, C. (Bureau of Radiological Health, Montgomery, AL). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

In April of 1985 an industry reported the loss of four industrial gauges that contained cesium 137. The State of Alabama surveyed eight scrap iron yards where the devices were believed to have been taken and found one of the four. The State then requested aerial monitoring assistance from the US Department of Energy. In July 1985 the DOE helicopter located an area of cesium 137 contamination in a waste slag dump yard. Examination of the waste slag dump showed maximum exposure levels of approximately 100 microR per hour and maximum soil contamination of 4.9×10^{-4} microcuries per gram. The area of contamination extended over 13,000 square feet. Erosion of cesium-containing waste slag was identified as the greatest potential health hazard associated with the contamination. The cost-benefit of spending $500,000+ to remove the material to a commercial burial site is at least questionable. Consideration is being given to a request by the owners of the property for burial on site.

15560 **(DOE/DP/93032—T1) Scientific basis for risk assessment and management of uranium mill tailings.** (National Research Council, Washington, DC (USA). Uranium Mill Tailings Study Panel). 1986. Contract AC01-84DP93032. 260p. NTIS, PC A12/MF A01; 1; GPO Dep. File Number DE87003893.

Uranium mill tailings are the finely ground sand-like material that is left after uranium is extracted from ore. As of early 1983, approximately 200 million metric tons of uranium mill tailings covering 1300 ha at 51 sites had accumulated in the United States. Most of these sites are in the arid Southwest. Uranium mill tailings present health and environmental concerns because of the residual radioactivity that they contain and because of a variety of other potential pollutants, such as chlorides, sulfates, and heavy metals. The milling process makes the radioactive and nonradioactive materials contained in the ore when it was mined much more mobile and also adds several potential contaminants to the tailings material during the milling process. Exposure routes of concern are release of the gas ^{222}Rn, airborne dust, and surface and groundwater contamination. In addition, the use of tailings as construction material or fill can lead to dangerously high levels of radon in associated buildings. At the request of the Department of Energy, a National Research Council study panel, convened by the Board on Radioactive Waste Management, has examined the scientific basis for risk assessment and management of uranium mill tailings and issued this final report containing a number of recommendations. Chapter 1 provides a brief introduction to the problem. Chapter 2 examines the processes of uranium extraction and the mechanisms by which radionuclides and toxic chemicals contained in the ore can enter the environment. Chapter 3 is largely devoted to a review of the evidence on health risks associated with radon and its decay products. Chapter 4 provides a consideration of conventional and possible new technical alternatives for tailings management. Chapter 5 explores a number of issues of comparative risk, provides a brief history of uranium mill tailings regulation, and concludes with a discussion of choices that must be made in mill tailing risk management.

15561 **(DOE/EIS—126-F-Vol.1) Final environmental impact statement: Remedial actions at the former Climax Uranium Company uranium mill site, Grand Junction, Mesa County, Colorado: Volume 1, Text.** (USDOE Albuquerque Operations Office, NM. Uranium Mill Tailings Remedial Action Project Office). Dec 1986. 454p. NTIS, PC A20/MF A01. File Number DE87005502.

This statement evaluates and compares the environmental impacts associated with the remedial actions of the residual radioactive materials remaining at the inactive uranium processing site and associated vicinity properties at Grand Junction, Mesa County, Colorado. This statement is also intended to aid the BLM in amending their management framework plans and final resource management plan, as well as assisting in compliance with the withdrawal application as appropriate. The site is a 114-acre tract of private and state owned land which contains approximately 3.1 million cubic yards of tailings and associated contaminated soils. The vicinity properties are homes, businesses, public buildings, and vacant lots which may have been contaminated during construction by the use

of tailings as building material. An estimated 3465 vicinity properties would be cleaned up during remedial action of the tailings pile. The tailings were produced by the former Climax Uranium Company which processed uranium ore, which it sold to the US Atomic Energy Commission from 1951 to 1966 and to private sources from 1966 to 1970. This statement evaluates six alternatives for stabilization and disposal of the tailings and other contaminated materials: no action; stabilization at the Grand Junction site; disposal at the Cheney Reservoir site with truck transport; disposal at the Cheney Reservoir site with train and truck transport; disposal at the Two Road site with truck transport; and disposal at the Two Road site with train and truck transport. All of the alternatives except no action include remedial action at an estimated 3465 vicinity properties. Alternative 3 is DOE's preferred alternative.

15562 **(DOE/EIS—126-F-Vol.2) Final environmental impact statement: Remedial actions at the former Climax Uranium Company uranium mill site, Grand Junction, Mesa County, Colorado: Volume 2, Appendices.** (USDOE Albuquerque Operations Office, NM. Uranium Mill Tailings Remedial Action Project Office). Dec 1986. 341p. NTIS, PC A15. File Number DE87005555.

Volume II contains Appendix F - Hydrology Report and Appendix G - Floodplain and Wetlands Assessment.

15563 **(DOE/DP/48013—T1) Fundamental research of decision support systems: Final report.** Kurstedt, H.A. Jr. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA). Management Systems Labs.). 1986. Contract AS05-83DP48013. 239p. NTIS, PC A11. File Number DE87004644.

Through an iterative application of Decision Support Systems (DSS) apparatus and evolution of DSS concepts, we redefined DSS from a systems perspective. By focusing on successful DSS and the definition of success for the newly-defined DSS, we generated a paradigm for understanding, applying, and improving DSS. The significance of the research is that we now: (1) understand the various roles management tools play within the new DSS concept; (2) recognize the need for characterizing the domain of responsibility of a manager to obtain a successful DSS; and (3) have learned special characteristics of government agencies like Nuclear Materials (NM) to identify what features of the new DSS concept can be expected to improve performance.

15564 **(LA—10811-MS) Fundamental data analyses for measurement control.** Campbell, K.; Barlich, G.L.; Fazal, B.; Strittmatter, R.B. (Los Alamos National Lab., NM (USA)). Feb 1987. Contract W-7405-ENG-36. 24p. NTIS, PC A02/MF A01. File Number DE87004767.

A set of measurment control data analyses was selected for use by analysts responsible for maintaining measurement quality of nuclear materials accounting instrumentation. The analyses consist of control charts for bias and precision and statistical tests used as analytic supplements to the control charts. They provide the desired detection sensitivity and yet can be interpreted locally, quickly, and easily. The control charts provide for visual inspection of data and enable an alert reviewer to spot problems possibly before statistical tests detect them. The statistical tests are useful for automating the detection of departures from the controlled state or from the underlying assumptions (such as normality). 8 refs., 3 figs., 5 tabs.

15565 **(LA-UR—86-4113) LAVA [Los Alamos Vulnerability and Risk Assessment Methodology]: A conceptual framework for automated risk analysis.** Smith, S.T.; Lim, J.J.; Phillips, J.R.; Tisinger, R.M.; Brown, D.C.; FitzGerald, P.D. (Los Alamos National Lab., NM (USA); Lim and Orzechowski Associates (USA); USDOE, Washington, DC). 1986. Contract W-7405-ENG-36. 21p. (CONF-8611117—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003720.

From Annual meeting of the Society for Risk Analysis; Boston, MA, USA (9 Nov 1986).

At Los Alamos National Laboratory, we have developed an original methodology for performing risk analyses on subject systems characterized by a general set of asset categories, a general spectrum of threats, a definable system-specific set of safeguards protecting the assets from the threats, and a general set of outcomes resulting from threats exploiting weaknesses in the safeguards system. The Los Alamos Vulnerability and Risk Assessment Methodology (LAVA) models complex systems having large amounts of "soft" information about both the system itself and occurrences related to the system. Its structure lends itself well to automation on a portable computer, making it possible to analyze numerous similar but geographically separated installations consistently and in as much depth as the subject system warrants. LAVA is based on hierarchical systems theory, event trees, fuzzy sets, natural-language processing, decision theory, and utility theory. LAVA's framework is a hierarchical set of fuzzy event trees that relate the results of several embedded (or sub-) analyses: a vulnerability assessment providing information about the presence and efficacy of system safeguards, a threat analysis providing information about static (background) and dynamic (changing) threat components coupled with an analysis of asset "attractiveness" to the dynamic threat, and a consequence analysis providing information about the outcome spectrum's severity measures and impact values. By using LAVA, we have modeled our widely used computer security application as well as LAVA/CS systems for physical protection, transborder data flow, contract awards, and property management. It is presently being applied for modeling risk management in embedded systems, survivability systems, and weapons systems security. LAVA is especially effective in modeling subject systems that include a large human component.

15566 **FERC perspectives on nuclear fuel accounting issues.** McDanal, M.W. (Federal Energy Regulatory Commission). *Transactions of the American Nuclear Society;* **53**: 74-76(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of the presentation is to discuss the treatment of nuclear fuel and problems that have evolved in industry practices in accounting for fuel. For some time, revisions to the Uniform System of Accounts have been considered with regard to the nuclear fuel accounts. A number of controversial issues have been encountered on audits, including treatment of nuclear fuel enrichment charges, costs associated with delays in enrichment services, the treatment and recognition of fuel inventories in excess of current or projected needs, and investments in and advances to mining and milling companies for future deliveries of nuclear fuel materials. In an effort to remedy the problems and to adapt the Federal Energy Regulatory Commission's accounting to more easily provide for or point out classifications for each problem area, staff is reevaluating the need for contemplated amendments to the Uniform System of Accounts.

15567 **Nuclear fuel lease accounting.** Danielson, A.H. *Transactions of the American Nuclear Society;* **53**: 76-80(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The subject of nuclear fuel lease accounting is a controversial one that has received much attention over the years. This has occurred during a period when increasing numbers of utilities, seeking alternatives to traditional financing methods, have turned to leasing their nuclear fuel inventories. The purpose of this paper is to examine the current accounting treatment of nuclear fuel leases as prescribed by the Financial Accounting Standards Board (FASB) and the Federal Energy Regulatory Commission's (FERC's) Uniform System of Accounts. Cost accounting for leased nuclear fuel during the fuel cycle is also discussed.

15568 **Logbooks: A key to test/experiment data integrity.** Henderson, J.T. (Sandia National Labs., Albuquerque, NM 87185). pp 219-221 of Proceedings of the 38th annual quality congress. Milwaukee, WI; American Society for Quality Control (1984). (CONF-840569—).

From 38. ASQC annual quality congress; Chicago, IL, USA (14 May 1984).

The Waste Management and Transportation Directorate of Sandia National Laboratories (SNL) is applying a QA Program in accordance with DOE/AL Order 5700.6A to the acquisition of research and technology (R&T) data. This QA Program has recently placed emphasis on the importance of test/experiment logbooks to data integrity. This paper addresses the rationale as well as the entries (and supporting data) necessary for generating a complete and defensible logbook. Since such entries may be either of a one-time or repetitive nature, further distinctions and guidance are offered. This paper also addresses logbook maintenance and control. The time spent in documenting performance history may be wasted or rendered ineffectual if logbooks are not subject to routine maintenance and proper controls. Also, the human engineering of logbook generation is considered so that a structured format can be followed.

15569 **(INIS-XN—37) Radiation Protection Act 26.4.1957/174.** (International Atomic Energy Agency, Vienna (Austria)). 26 Apr 1957. 3p. (In Finnish). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701299.

This Act as amended sets the radiation protection principles applicable to nuclear activities in Finland. These include nuclear installations, nuclear materials, radioactive materials and equipment producing radiation. It provides for a licensing procedure for the possession, use and trade in radioactive materials and equipment producing radiation. (NEA).

15570 **(INIS-XN—38) Radiation Protection Decree 27.9.1957/328.** (International Atomic Energy Agency, Vienna (Austria)). 27 Sep 1957. 5p. (In Finnish). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701300.

This Decree as amended was made under the Radiation Protection Act 1957 and deals with the protection of workers against ionizing radiation. It specifies the licensing procedure required for possession, use, trade in, export and import of radioactive materials and equipment. (NEA).

15571 **(INIS-XN—39) Decision on radiation protection of 5.11.1968/594.** (International Atomic Energy Agency, Vienna (Austria)). 5 Nov 1968. 30p. (In Finnish). NTIS (US Sales Only), PC A03/MF A01. File Number DE87701301.

This decision on radiation protection was issued by the Finnish Ministry of Social Affairs and Health. It contains tables of radioisotopes and specifies radiation limits. (NEA).

15572 **(INIS-XN—41) Decree relating to the annual leave of persons working under harmful radiation conditions (No. 175/67).** (International Atomic Energy Agency, Vienna (Austria)). 14 Apr 1967. 1p. (In Finnish). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701303.

This Decree as amended concerns radiation workers. It deals with the annual leave of persons occupationally exposed to radiation. (NEA).

15573 **(INIS-XN—42) Council of State decision relating to examinations under Section 5 of the Radiation Protection Act (No. 243/58).** (International Atomic Energy Agency, Vienna (Austria)). 5 Jun 1958. 1p. (In Finnish). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701304.

This decision issued by the Finnish Council of State was issued under Section 5 of the Radiation Protection Act 1957 according to which owners or holders of radioactive waste materials are under obligation to render them harmless and at their expense. (NEA).

15574 **(INIS-XN—46) Ministerial Decision No. 116 on the export of some materials, equipment and devices in the field of Atomic Energy.** (International Atomic Energy Agency, Vienna (Austria)). 18 Jan 1977. 2p. (In Finnish). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701308.

Published in Finnish Official Gazette No. 116.

This decision of the Ministry of Trade and Industry contains a list of equipment, facilities and materials other than nuclear materials the export of which requires a special permit in accordance with the Atomic Energy Act. The content of the list follows closely the trigger list defined by Memorandum B in the Appendix to IAEA document INFCIRC/209. (NEA).

15575 **(INIS-XN—48) Decision of the National Board of Navigation on the Carriage of Dangerous Goods in Ships.** (International Atomic Energy Agency, Vienna (Austria)). 1984. 7p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701310.

This is an unofficial English translation of a decision, which was made in accordance with Section 12 of Decree No. 357 of 16th May 1980 on the Carriage of Dangerous Goods in Ships. It adopts by reference the IMO/IMDG Code with the packaging Annex and Amendments 1 - 21. Where the National Board of Navigation has not provided otherwise, the Code shall be applied to vessels carrying dangerous goods, to the classification, packing, marketing and handling of dangerous goods and the stowage of such goods on board, and to documents related to carriage of dangerous goods. The decision applies to vessels engaged in traffic in Finnish territorial waters and to all Finnish vessels, even when operating outside Finnish territorial waters. The decision designates the Finnish Centre for Radiation and Nuclear Safety as the competent authority where approval certificates for transport, packages or containers of radioactive materials are required. (NEA).

15576 **(INIS-XN—49) Aviation Regulation OPS M1-18 on the Transport of Dangerous Goods by Air.** (International Atomic Energy Agency, Vienna (Austria)). 10 Jan 1984. 17p. (In Finnish). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701311.

This regulation, issued by the National Board of Aviation in accordance with Section 49 of the Aviation Act (595/64) and Section 108 of the Aviation Decree (525/68), adopts by reference the ICAO Technical Instructions for the Safe Transport of Dangerous Goods by Air. The content of the regulation follows closely Annex 18 to the Chicago Convention on International Civil Aviation. The regulation specifically provides that in packaging of radioactive materials the requirements of ICAO-TI are to be followed and designates the Finnish Centre for Radiation and Nuclear Safety as the competent authority in Finland to test and certify packaging. (NEA).

15577 **TURF Californium facility at Oak Ridge National Laboratory.** King, L.J. (Oak Ridge National Lab., TN). *Transactions of the American Nuclear Society;* **53**: 158-159(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The TURF Californium Facility at the Oak Ridge National Laboratory (ORNL) has been expanded and modified, and the Californium Industrial Sales/Loan Program has been transferred to ORNL from the Savannah River Plant. The TURF Californium Facility has been operated since 1970 by the staff of the ORNL Transuranium Processing Plant (TPP) as part of the Heavy-Element Research Program of the US Department of Energy (DOE) Office of Basic Energy Sciences (BES). The facility was built to provide hot-cell space that is free of ^{244}Cm contamination in which

to recover high-isotopic-purity ^{248}Cm, the alpha decay daughter of ^{252}Cf, for use in research. All ^{252}Cf handling operations for the BES program, including purification, packaging, and neutron source fabrication, are done in the TURF Californium Facility.

15578 **Nuclear data for gadolinium production.** Holden, N.E. (Brookhaven National Lab., Upton, NY). *Transactions of the American Nuclear Society;* **53**: 163-164(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

There has been a marked increase in requests for neutron cross-section data of the rare-earth isotopes, ^{152}Gd, ^{153}Gd, ^{151}Eu, ^{152}Eu, ^{153}Eu, ^{154}Eu, and ^{155}Eu because of the use of natural europium-oxide in reactor production of ^{153}Gd. This gadolinium isotope is needed because of its use as the working ingredient in an advanced medical scanning machine that can detect loss of bone minerals such as calcium, a possible cause of the disease osteoporosis. Hanford's Fast Flux Test Facility plans to begin production of several ^{153}Gd specimens during this autumn's operating cycle. An analysis of various experiments led to recommended values for the cross sections and resonance integrals, which are displayed and compared with the ENDF/B-V values. The detailed data underlying these recommendations are presented.

15579 **Californium-252 neutron calibration flux distribution by Monte Carlo simulation.** West, L.; Stingley, R.M. (Univ. of Arkansas, Fayetteville). *Transactions of the American Nuclear Society;* **53**: 164-165(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the past few years, ^{252}Cf neutron sources have become the primary means of defining a benchmark neutron field. It is the only nuclide with sufficient spontaneous fission neutrons to achieve a useful neutron flux level; and the ^{252}Cf fission spectrum is much better known than any other benchmark employed for reactor dosimetry calibration. Total neutron emission for small sources can be determined by the National Bureau of Standards (NBS) using a 4π manganese sulfate bath. However, dosimetry irradiations are typically performed in a plane perpendicular to the cylindrical axis of the source, not in 4π geometry. Cylindrical encapsulation will certainly introduce some anisotropy; i.e., angular dependence in the total flux and in the flux per unit energy. Any anisotropy of the flux will systematically bias an irradiation result since an isotropic flux distribution is usually assumed if no anisotropy information is available. An anisotropy factor in the flux of ~1.01 can be considered to be a small bias, even if the irradiation result is accurate to 2% or less. The flux anisotropy factor indicated by this work is closer to 1.05 for certain sources, a significant factor.

15580 **(OEFZS—4376) Non-contacting thickness-gauging of fine steel plates.** Frevert, E. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H.). Oct 1986. 36p. (In German). (IA—151/86). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700848.

With plates of 15 different alloys of fine steel the absorption of the gamma rays of /sup 137/Cs was measured as a function of the thickness. In 5 series of measurements the distances source - detector and source - probe were changed. The analysis of the records obtained showed that with a constant distance source - detector of about 250 mm a change of the position of the probe of more than +-20 mm has no influence to the measuring values. A distribution of the probes in 4 groups with average values of the absorption coefficients leads to deviations of the calculated values to the nominal thickness values between +0.18 mm and -0.16 mm, whereat by this distribution systematic errors occure. For exact measurements therefore the alloy specific absorption coefficients must be taken. An accuracy of better than +-0.1 mm must be obtainable.

15581 **Multipurpose prompt gamma facility.** Miller, G.D.; Wehring, B.W. (North Carolina State Univ., Raleigh). *Transactions of the American Nuclear Society;* **53**: 161-162(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper deals with the design, construction, and utilization of a multipurpose Prompt Gamma Facility at the North Carolina State University (NCSU) PULSTAR Nuclear Reactor. Specifically, features of the design that promote multi-use, and test results for various applications are presented.

0703 Isotopic Power Supplies

15582 **(LA—10742-MS) General-Purpose Heat Source Development: Safety Verification Test Program. Flyer plate test series.** Cull, T.A.; Pavone, D. (Los Alamos National Lab., NM (USA)). Sep 1986. Contract W-7405-ENG-36. 36p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87002234.

The General-Purpose Heat Source (GPHS) is a modular component of a radioisotope thermoelectric generator (RTG) that will provide electric power for space missions. The initial RTG applications will be for the NASA Galileo and the ESA Ulysses missions. Each of the 18 GPHS modules in an RTG contains four $^{238}PuO_2$-fueled clads and generates 250 W/sub (t)/. A series of Safety Verification Tests (SVTs) has been conducted to assess the ability of the GPHS fueled clads to contain the plutonia in accident environments. Because a launch pad or postlaunch explosion of the Space Transportation System Vehicle (space shuttle) is one conceivable accident, the SVT plan included a series of tests to simulate the fragment environment that the RTG and GPHS modules would experience in such an event. These tests deal specifically with the flat-on collision of flyer-plate-type fragments with bare, simulant-fueled (depleted UO_2) clads. Results of these tests suggest that the fueled clad is only minimally breached by collision with 3.53-mm-thick flyer-plate-type fragments of space shuttle alloy at velocities up to 1170 m/s. However, collision of a 38.1-mm-thick plate with a bare GPHS clad, at a velocity of 270 m/s, results in a total release of fuel.

15583 **Catalyzed steam gasification of low-rank coals to produce hydrogen.** Sears, R.E.; Timpe, R.C.; Galegher, S.J.; Willson, W.G. (Univ. of North Dakota, Energy Research Center, Box 8213, University Station, Grand Forks, ND 58202). *Preprints of Papers, American Chemical Society, Division of Fuel Chemistry;* **31**: No. 3, 166-175(1986). (CONF-8609181—).

From ACS symposium on syngas conversion catalysis advances in gasification; Santa Clara, CA, USA (7 Sep 1986).

Advance coal gasification technologies using low-rank coal is a promising alternative for meeting future demand for hydrogen. Steam gasification tests conducted at temperatures between 700° and 800°C and atmospheric pressure resulted in product gas compositions matching those predicted by thermodynamic equilibrium calculations, 63-65 mol% hydrogen and less then 1 mol% methane. Steam gasification tests with four low-rank coals and a single bituminous coal were performed in a laboratory-scale thermogravimetric analyzer (TGA) at temperatures of 700°, 750°, and 800°C to evaluate process kinetics with and without catalyst addition. Catalysts screened included K/sub 2/CO/sub 3/, Na/sub 2/CO/sub 3/, trona, nahcolite, sunflower hull ash, and recycled lignite ash. North Dakota and Texas lignite chars were slightly more reactive than a Wyoming subbituminous coal char and eight to ten times more reactive than an Illinois bituminous coal char. Pure and mineral (trona nd nahcolite) alkali carbonates and recycled ash from K/sub 2/CO/sub 3/-catalyzed steam gasification tests substantially im-

proved low-rank coal steam gasification rates. The reactivities obtained using trona and nahcolite to catalyze the steam gasification were the highest, at nearly 3.5 times those without catalysts.

Industrie-Ausruestungen G.m.b.H., Geisenheim (Germany, F.R.). Abt. Neue Technologie - Energie). Dec 1986. 33p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE87751298.

The exploitation of tree bark for energy purposes was investigated in the research project with the goal of producing high-grade charcoal and poor gas suitable for engines. The drying of tree bark with an initial humidity of over 200% abs. dry to the humidity of max. 20% required for the gasification process proved to be very expensive when using mechanical as well as thermal techniques. Besides this, the theoretical and practical investigations showed that the gas quality was unsatisfactory for use in engines despite high preheating of the air, and that charcoal can only be produced in small amount. The attainable charcoal quality hardly promises an economically interesting field of application. With 10 tabs., 2 figs.

15585 **(CONF-860709—3) Development of an advanced anaerobic digester design and a kinetic model for biogasification of water hyacinth/sludge blends.** Srivastava, V.; Fannin, K.F.; Biljetina, R.; Chynoweth, D.P.; Hayes, T.D. (Institute of Gas Technology, Chicago, IL (USA); Florida Univ., Gainesville (USA); Gas Research Inst., Chicago, IL (USA)). Jul 1986. 25p. Institute of Gas Technology, 3424 South State Street, Chicago, IL 60616. File Number TI87900436.

From Conference on research and applications of aquatic plants for water treatment and resource recovery; Orlando, FL, USA (20 Jul 1986).

The Institute of Gas Technology (IGT) conducted a comprehensive laboratory-scale research program to develop and optimize the anaerobic digestion process for producing methane from water hyacinth and sludge blends. This study focused on digester design and operating techniques, which gave improved methane yields and production rates over those observed using conventional digesters. The final digester concept and the operating experience was utilized to design and operate a large-scale experimentla test unit (ETU) at Walt Disney World, Florida. This paper describes the novel digester design, operating techniques, and the results obtained in the laboratory. The paper also discusses a kinetic model which predicts methane yield, methane production rate, and digester effluent solids as a function of retention time. This model was successfully utilized to predict the performance of the ETU. 15 refs., 6 figs., 6 tabs.

15587 **(BNL—39087) Methanol for transportation of natural gas values.** O'Hare, T.E.; Sapienza, R.S.; Mahajan, D.; Skaperdas, G.T. (Brookhaven National Lab., Upton, NY (USA)). Jun 1986. Contract AC02-76CH00016. 11p. (CONF-8606197—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87005391.

From Joint conference on the introduction and development of methanol as an alternative fuel; Columbus, OH, USA (26 Jun 1986).

A new process under development at the Brookhaven National Laboratory departs significantly from current commercial practice for synthesizing methanol from natural gas. The significant innovations in this process are described and the consequences of the changes are outlined. A process flow sheet for the new synthesis is described and a cost estimate, based on the equipment and flow sheet, is presented and compared with cost estimates for conventional, low pressure methanol synthesis. In addition, cost estimates for shipping natural gas values to distant markets as synthesized methanol, or as liquefied natural gas, are compared. The economic advantages of the Brookhaven methanol process indicate that methanol shipping can deliver natural gas values at lower cost than can LNG for the same energy delivery, while decreasing capital investment requirements significantly. 1 fig., 3 tabs.

15588 **(BNL—39088) Low temperature methanol process: The next step.** O'Hare, T.E.; Sapienza, R.S.; Mahajan, D.; Skaperdas, G.T. (Brookhaven National Lab., Upton, NY (USA)). May 1986. Contract AC02-76CH00016. 11p. (CONF-8605223—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87005390.

From 11. annual conference on clean liquid and solid fuels; Palo Alto, CA, USA (7 May 1986).

Gas production is on the increase and international trade even more so, with LNG making most progress. It has been projected that by the year 2000, approximately 190 million metric tons per year of LNG could be moving in worldwide trade. The further penetration of natural gas into distant markets can be substantially increased by a new methanol synthesis process under development at the Brookhaven National Laboratory. The new methanol process is made possible by the discovery of a catalyst that drops synthesis temperatures from about 275°C to about 100°C. The new low temperature liquid catalyst can convert synthesis gas completely to methanol in a single pass through the methanol synthesis reactor. This characteristic leads to a further major improvement in the methanol plant. Atmospheric nitrogen can be tolerated in the synthesis gas, and still the volume of gas fed to the reactor can be smaller than the volume of gas that must be fed to the reactor when accommodating the very low conversions furnished by the best of currently available catalysts. The energy disadvantage of the methanol option must be balanced against the advantage of a much lower capital investment requirement made possible by the new BNL synthesis. Preliminary estimates show that methanol conversion and shipping require an investment for liquefaction to methanol, and shipping liquefied methanol that can range from 35 to 50% of that needed for the LNG plant and LNG shipping fleet. This large reduction in capital requirements is expected to make liquefaction to methanol attractive in many cases where the LNG capital needs are prohibitive. Alternately, the economically viable minimum size can be significantly smaller for the methanol route, which should serve to expand markets distant from the production areas. A significant increase in gas markets may be expected from the introduction of the new methanol synthesis process.

15589 **(BNL—39089) Liquefaction of natural gas to methanol for shipping and storage.** O'Hare, T.E.; Sapienza, R.S.; Mahajan, D.; Skaperdas, G.T. (Brookhaven National Lab., Upton, NY (USA)). Jul 1986. Contract AC02-76CH00016. 11p. (CONF-860904—3). NTIS, PC A02/MF A01; GPO Dep. File Number DE87005389.

From International gas research conference; Toronto, Canada (8 Sep 1986).

The penetration of natural gas into distant markets can be substantially increased by a new methanol synthesis process under development at the Brookhaven National Laboratory. The new methanol process is made possible by the discovery of a catalyst that drops synthesis temperatures from about 275°C to about 100°C. The new low temperature liquid catalyst can convert synthesis gas completely to methanol in a single pass through the methanol synthesis reactor. This characteristic leads to a further major improvement in the methanol plant. As a result of process design factors made possible by the BNL catalyst, the plant required to convert natural gas to methanol is very simple. Conversion of natural gas to methanol requires two chemical reactions, both of which are exothermic, and thus represent a loss of heating value in the feed natural gas. This loss is about 20% of the feed gas energy, and is, therefore, higher than the 10% loss in energy in natural gas liquefaction, which is a simpler physical - not a chemical - change. The energy disadvantage of the methanol option must be balanced against the advantage of a much lower capital investment requirement made possible by the new BNL synthesis. Preliminary estimates show that methanol conversion and shipping require an investment for liquefaction to methanol, and shipping liquefied methanol that can range from 35 to 50% of the capital needed for the LNG plant and LNG tanker fleet. This large reduction in capital requirements is expected to make liquefaction to methanol attractive in many cases where the LNG capital needs are prohibitive. 3 tabs.

15590 **(NP—7770054) Development and modelling of a gas/solid fluidized-bed fermenter for ethanol production from S. cerevisiae.** Roettenbacher, L. (Technische Univ. Hamburg-Harburg (Germany, F.R.). Promotionsausschuss). 1985. 175p. (In German). NTIS (US Sales Only), PC A08/MF A01. File Number DE87770054.

Using the example of ethanol production from S. cerevisiae, the author attempts to provide a basis for the operation and modelling of a novel bioreactor, i.e. the gas/solid fluidized-bed fermentation reactor. Since the performance of this reactor is largely determined by the fluidisation characteristics of the yeast pellets, an optoelectronic measuring system was developed for online monitoring of the fluidisation status. The kinetics of ethanol formation was determined by a novel method of measurement in which the reactions inside the reactor are continuously monitored by means of IR analyzers. The measurements showed a dependence of the ethanol formation rate on the glucose concentration as postulated by Michaelis-Menten. Product inhibition by ethanol can be described by a linear relationship between the specific ethanol formation rate and the ethanol concentration. The optimum reaction temperature was found to be T=36/sup 0/C. A mathematical model linking the mixing properties of the reactor with the transient reaction processes in the individual pellets as derived from the known laws governing the submerged system permits calculations of the ethanol, cell mass and CO/sub 2/ yields, i.e. of the ethanol production efficiency of the reactor. Optimisation of the fermenter performance requires a high solids circulation rate and optimum substrate distribution.

15591 **(PB—87-110532/XAB) Methanol production from indigenous resources in New York State.** (Science Applications International Corp., McLean, VA (USA)). May 1983. 406p. NTIS, PC PC E99.

15592 **(PB—87-110540/XAB) Methanol production from indigenous resources in New York State. Volume 1. Executive summary.** Wan, E.I.; Price, J.D.; Simmons, J.A. (Science Applications International Corp., McLean, VA (USA)). May 1983. 31p. NTIS, PC A03/MF A01.

See also Volume 2, PB87-110557; Also available in set of 3 reports PC E99, PB87-110532.

The three volumes of the report are: Executive Summary, Resource Assessment, and Technical and Economic Evaluation of Conversion Process Plants. The report presents a detailed analysis of New York State's methanol production capacity. Based on a technical and economic analysis of seven major indigenous resources and 11 conceptual methanol process plants designed by SAI, the report indicates that the production of methanol utilizing small-scale conversion plants (30-150-TPD methanol capacity) is technically feasible, but not yet economically competitive at current market prices (60 cents/gallon). In the long term, methanol fuel produced from several indigenous resources has the potential to contribute up to 7,000 TPD (693 million gallons/year) in liquid fuel supplies for New York State. The major resources available for methanol production will most likely be forest biomass, peat, landfill gas and unconventional shale gas.

15593 **(PB—87-110557/XAB) Methanol production from indigenous resources in New York State. Volume 2. Technical and economic evaluation of conversion process plants.** Wan, E.I.; Price, J.D.; Simmons, J.A. (Science Applications International Corp., McLean, VA (USA)). May 1983. 167p. NTIS, PC A08/MF A01.

See also Volume 1, PB87-110540 and Volume 3, PB87-110565; Also available in set of 3 reports PC 99, PB87-110532.

The report includes the following: Introduction and summary; Status of methanol production technology; Process development and design; Cost estimates of methanol production plants; and Methanol production economics and financial analysis.

15594 **(PB—87-110565/XAB) Methanol production from indigenous resources in New York State. Volume 3. Technical and economic evaluation of conversion process plants.** Wan, E.I.; Price, J.D.; Simmons, J.A. (Science Applications International Corp., McLean, VA (USA)). May 1983. 208p. NTIS, PC A10/MF A01.

See also Volume 2, PB87-110557; Also available in set of 3 reports PC E99, PB87-110532.

The report includes the following: Executive summary; Forest biomass; Agricultural residues; Energy plantations; Municipal solid wastes; Landfill gas; Sewage digester gas; Peat; Unconventional natural gas.

0904 Solid Waste And Wood Fuels

REFER ALSO TO CITATION(S) 15599

15595 **(DOE/CE/63487—T2) Study of the feasibility of the commercial production of refuse derived fuel.** (Goldenrod Hills Community Action Agency, Walthill, NE (USA). Tri-County Council). 1986. Contract FG01-86CE63487. 79p. NTIS, PC A05. File Number DE87004906.

In Nebraska, approximately 3.5 pounds of domestic waste is generated per person per day. Most of this waste is not recycled but is being disposed of in either a landfill or an open dump. In the state of Nebraska there are 359 dumps being used by municipalities of less than 5000 people which have been exempt from state control since 1972 as the result of implementation of the Whitney Amendment. A survey at 68 of the 359 sites showed that most of the sites were not supervised and were engaging in activities which are either strictly regulated or prohibited in the state's 63 licensed landfills. The need does exist to develop a different method of disposing of municipal waste. Converting the refuse into biomass pellets would be one way to address this need. It is proposed to establish a business to be incorporated under the name of Progressive Fuels, Inc. and to manufacture refuse derived fuel (RDF) in northeast Nebraska.

1401 Resources And Availability

15596 **(PB—87-103636/XAB) New England solar energy atlas.** Cook, D.L. (Maine Univ., Orono (USA)). 25 Jul 1986. 82p. NTIS, PC A05/MF A01.

The book simplifies the available data on solar energy in New England. It is not intended as a guide on solar collector and/or home design; however, the information should aid the engineer, architect, or layman in using solar radiation as a renewable energy resource.

15597 **(SERI/TR—215-2948) The SERI Resource Assessment Project's plan for collecting spectral-solar-irradiance data.** Riordan, C.; Hulstrom, R. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1986. Contract AC02-83CH10093. 15p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87001134.

This report describes the Resource Assessment Project's plan for collecting spectral-solar-irradiance data. The plan presents a common approach and guidelines for collecting spectral-irradiance and related data to develop an archive that represents different climates and photovoltaic-collector modes. The plan describes the necessary measurements and documentation, the measurement approach, and the data flow/format from the collection sites to the archive.

15598 **(BNL—38870) Thylakoid phosphoproteins.** Coughlan, S.J.; Hind, G. (Brookhaven National Lab., Upton, NY (USA)). 1986. Contract AC02-76CH00016. 25p. (CONF-860808—11). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003203.

From 7. international congress on photosynthesis; Providence, RI, USA (10 Aug 1986).

Thylakoid phosphoproteins were successively fractionated by (1) treatment of ^{32}P-labeled membranes with 1 M NaBr to remove superficial proteins; (2) extraction with octyl glucoside/cholate; (3) precipitation with ammonium sulfate; (4) size exclusion chromatography on BioGel P300, and (5) sucrose density gradient centrifugation. The detergent extract contained $<10\%$ of the original membrane-bound ^{32}P; it was enriched in cytochrome b/f complex and 64-kDa protein kinase. A 20-kDa protein which copurified with the cytochrome complex and was assumed to be the Rieske protein, was partially phosphorylated. The protein kinase, which phosphorylates itself in vitro, appeared on the sucrose gradient as a phosphoprotein, signalling that it had become labeled in the intact thylakoid. A phosphoprotein of $\sim$10 kDa which is seen as a product of directly radiolabeling the BioGel P300 extract, was found to differ from the well documented phosphoprotein of this approximate mass that appears in labeled thylakoids. 30 refs., 3 figs., 2 tabs.

15599 **(CONF-860405—7) Energy from biomass and wastes: 1985 update.** Klass, D.L. (Institute of Gas Technology, Chicago, IL (USA)). Apr 1986. Contract AC02-80CS83004. 102p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE87004018.

From 10. annual symposium on energy from biomass and wastes; Washington, DC, USA (7 Apr 1986).

A comprehensive assessment of renewable technology options has shown that biofuels is the only option capable of making significant contributions to all energy sectors. The total contribution of renewable energy to primary energy demand in the USA today is about 6.8 quad/yr (3.2 million BOE/d); biofuels provide about 40% of the total. Research on SRIC trees and herbaceous and aquatic biomass has targeted specific species for development. Some of these species appear to be near economic feasibility as energy crops now. Commercialization of biomass and waste combustion systems has shown a spurt in growth because of the business opportunities offered by PURPA for cogeneration. Thermochemical gasification research on advanced technology systems has reached the point where scale-up is being considered. Commercialization of state-of-the-art technologies has slowed, but applications for small-scale producer gasifiers, particularly in developing countries, continue to expand. Thermochemical liquefaction research has concentrated mainly on high-temperature pyrolytic conversion methods that can increase yields and selectivities. Significant research achievements have been made in anaerobic digestion, but whatever its future as a large-scale source of methane, it is clear that digestion capacity will have to increase many-fold before biological methane can attain its potential. The reduction in lead content of gasolines by the EPA presents substantial marketing opportunities to alcohol fuel producers. If projections for ethanol fuel markets materialize, conversion of low-cost lignocellulosics will be necessary. Considerable research is now in progress to develop this technology. 256 refs., 32 tabs.

15600 **(CONF-8609228—1) Biological engineering for sustainable biomass production.** Shen, S. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004660.

From National forum on biodiversity; Washington, DC, USA (21 Sep 1986).

A new discipline has evolved in efforts to engineer photosynthetic production systems that produce biomass feedstocks efficiently, economically and with minimal adverse environmental impact. In this talk an overview is given of how biological engineering systems are designed to produce energy and novel material products within the framework of existing market infrastructure. Practical examples of biological engineering systems which employ components based on genetic engineering, species propagation, modern agricultural techniques, chemical engineering, and mechanical engineering are analyzed for worldwide materials application and environmental conservation. 9 refs., 6 figs.

15601 **(CONF-8609243—1) Illinois biotechnology resources: An overview.** Drucker, H. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004682.

From Governor's conference on science and technology in Illinois; Rosemont, IL, USA (3 Sep 1986).

Plant-based biotechnology covers a large number of biological and chemical fields. In most midwestern states agribusiness is either the number one or number two contributor to total state gross product. State and federal governments, industries, and land-grant universities all consider the development of new biotechnology-based agribusinesses as the core of a set of new industries. The midwest and Illinois have many of the principal users, processors, and chemical and biological purveyors of agribusiness. They will be the developers of new products and processes. In local universities, both private and public, and within the federal laboratories, such as Argonne and the Northern Regional Research Laboratory of the US Department of Agriculture, a research community is actively employed in many of the areas considered by industry as most critical to the development of new technologies. To facilitate the transfer of research results to industry, we have been developing, over the past two years, a consortium of major midwestern universities, research institutes, and agribusiness companies who consider biotechnology of some importance to their future. 4 figs., 1 tab.

15602 **(DOE/ER/03231—10) Effect of light and development of photosynthetic cells: Final report.** Gibbs, M. (Brandeis Univ., Waltham, MA (USA)). 1986. Contract AC02-76ER03231. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87005183.

Green algae exposed to an anaerobic environment "adapt" to a hydrogen metabolism and can photooxidize H_2O to H_2 and O_2 as well as carbon compounds to H_2 and CO_2. The products from fermentation of chloroplastic starch included acetate, formate, ethanol, CO_2, H_2, glycerol, and lactate. Light caused an increase in H_2 and CO_2 and decreases in acetate and ethanol. Aerobically isolated algal chloroplasts adapted to a hydrogen metabolism where H_2 was evolved. The oxyhydrogen reaction was not detected in the chloro-

plasts. Acetate is photoassimilated anaerobically by Chlamydomonas cells to lipid, carbohydrate, CO_2, and H_2 with a stoichiometry indicating a light-dependent anaerobic glyoxylate cycle as the primary assimilatory pathway.

15603 **(DOE/JPL—1012-113) Environmental tests of metallization systems for terrestrial photovoltaic cells.** Alexander, P. Jr. (Jet Propulsion Lab., Pasadena, CA (USA)). 31 Dec 1985. Contract AI01-76ET20356. 78p. (JPL-PUB—85-86). NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87005419.

Seven different solar cell metallization systems were subjected to temperature cycling tests and humidity tests. Temperature cycling excursions were -50°C to 150°C per cycle. Humidity conditions were 70°C at 98% relative humidity. The seven metallization systems were: (1) Ti/Ag, (2) Ti/Pd/Ag, (3) Ti/Pd/Cu, (4) Ni/Cu, (5) Pd/Ni/Solder, (6) Cr/Pd/Ag, and (7) Thick Film Ag. All of the seven metallization systems showed slight to moderate decreases in cell efficiencies after subjection to 1000 temperature cycles. Six of the seven metallization systems also evidenced slight increases in cell efficiencies after moderate numbers of cycles, generally less than 100 cycles. The copper-based systems showed the largest decrease in cell efficiencies after temperature cycling. All of the seven metallization systems showed moderate to large decreases in cell efficiencies after 123 days of humidity exposure. The copper-based systems again showed the largest decrease in cell efficiencies after humidity exposure. Graphs of the environmental exposures versus cell efficiencies are presented for each of the metallization systems, as well as environmental exposures versus fill factors or series resistance.

15604 **(DOE/JPL—1012-120) Chemical bonding technology: Direct investigation of interfacial bonds.** Koenig, J.L.; Boerio, F.J.; Plueddemann, E.P.; Miller, J.; Willis, P.B.; Cuddihy, E.F. (Jet Propulsion Lab., Pasadena, CA (USA)). Jan 1986. Contract AI01-85CE89008. 52p. (JPL-PUB—86-6). NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87005424.

This is the third Flat-Plate Solar Array (FSA) Project document reporting on chemical bonding technology for terrestrial photovoltaic (PV) modules. The impetus for this work originated in the late 1970s when PV modules employing silicone encapsulation materials were undergoing delamination during outdoor exposure. At that time, manufacturers were not employing adhesion promoters and, hence, module interfaces in common with the silicone materials were only in physical contact and therefore easily prone to separation if, for example, water were to penetrate to the interfaces. Delamination with silicone materials virtually vanished when adhesion promoters, recommended by silicone manufacturers, were used. With the decrease in use of silicone encapsulates, and the increase in use of hydrocarbon encapsulates such as ethylene vinyl acetate (EVA), the need developed for adhesion promoters specifically developed for these new materials. The adhesion promoters being developed for EVA-type materials are based on organosilanes, which generate primary chemical bonds at the interface, that is, chemical bonding. These adhesion promoters are commonly referred to as "primers". This report describes the activities related to the direct investigation of chemically bonded interfaces.

15605 **(DOE/JPL—1012-121) The aging correlation (RH + t): Relative humidity (%) + temperature (°C).** Cuddihy, E.F. (Jet Propulsion Lab., Pasadena, CA (USA)). 15 Jan 1986. Contract AI01-85CE89008. 20p. (JPL-PUB—86-7). NTIS, PC A02/MF A01; GPO Dep. File Number DE87005425.

An aging correlation between corrosion lifetime and relative humidity RH(%) and temperature t(a)C) has been reported in the literature. This aging correlation is a semi-log plot of corrosion lifetime on the log scale versus the interesting summation term [RH(%) + t(°C)] on the linear scale. This empirical correlation was derived from observation of experimental data trends and has been referred to as an experimental law. Using electrical resistivity data of polyvinyl butyral (PVB) measured as a function of relative humidity and temperature, it was found that the electrical resistivity could be expressed as a function of the term [RH(%) + t(°C)]. Thus, if corrosion is related to leakage current through an organic insulator, which, in turn, is a function of RH and t, then some partial theoretical validity for the correlation is indicated. This article describes the derivation of the term [RH(%) + t(°C)] from PVB electrical resistivity data.

15606 **(DOE/JPL—1012-123) Silicon production in a fluidized bed reactor: Final report.** Rohatgi, N.K. (Jet Propulsion Lab., Pasadena, CA (USA)). Apr 1986. Contract AI01-85CE89008. 70p. (JPL-PUB—86-17). NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87005427.

Part of the development effort of the JPL in-house technology involved in the Flat-Plate Solar Array (FDSA) Project was the investigation of a low-cost process to produce semiconductor-grade silicon for terrestrial photovoltaic cell applications. The process selected was based on pyrolysis of silane in a fluidized-bed reactor (FBR). Following initial investigations involving 1- and 2-in. diameter reactors, a 6-in. diameter, engineering-scale FBR was constructed to establish reactor performance, mechanism of silicon deposition, product morphology, and product purity. The overall mass balance for all experiments indicates that more than 90% of the total silicon fed into the reactor is deposited on silicon seed particles and the remaining 10% becomes elutriated fines. Silicon production rates were demonstrated of 1.5 kg/h at 30% silane concentration and 3.5 kg/h at 80% silane concentration. The mechanism of silicon deposition is described by a six-path process: heterogeneous deposition, homogeneous decomposition, coalescence, coagulation, scavenging, and heterogeneous growth on fines. The bulk of the grown silicon layer appears to be made up of small diameter particles. This product morphology lends support to the concept of the scavenging of homogeneously nucleated silicon. Excellent purity of the silicon product was obtained from an FBR equipped with a quartz liner. The product silicon had metallic contaminants less than the detection limits of spark source mass spectroscopy (e.g., Fe $\leqq$ 0.6 ppMa, Cr $<$ 0.02 ppMa, Zn $<$ 0.04 ppMa, Co $\leqq$ 0.1 ppMa). Solar cells fabricated from this pure silicon product showed encouraging results and the data are described in this report.

15607 **(DOE/JPL/957031—86-Final) Ink jet printing of silver metallization for photovoltaics: Final technical report for the period 10/1/84 through 9/30/86.** Vest, R.W. (Jet Propulsion Lab., Pasadena, CA (USA)). 30 Sep 1986. Contract NAS-7-100-957031. 226p. NTIS, PC A11/MF A01; 1; GPO Dep. File Number DE87004786.

A computer controlled ink jet printing system for depositing any desired pattern of conductor lines was developed. Major changes were made in the ink supply and pressure control systems and in all electronic sub-systems for pulsing the spray head and driving the positioning table. A personal computer was integrated into the system. The preferred ink was identified, and the effects of ink viscosity, drop frequency, pulse voltage and nozzle diameter on line definition and ink flow rate were experimentally determined. A theoretical model for ink flow rate was developed, and the agreement between theory and experiment was determined. The characteristics of solar cells metallized by the ink jet printing system were evaluated. (LEW)

15608 **(N—87-12048) Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program.** Anspaugh, B.E.; Weiss, R.S. (Jet Propulsion Lab., Pasadena, CA (USA)). Nov 1986. 41p. (NASA-CR—179916; JPL-PUB—86-42; NAS—1.26:179916). NTIS, PC A03/MF A01.

The 1986 solar cell calibration balloon flight was successfully completed on July 15, 1986, meeting all objectives of the program. Thirty modules were carried to an altitude of 118,000 ft (36.0 km). The calibrated cells can now be used as reference standards in simulator testing of cells and arrays.

15609 **(PB—87-109153/XAB) Land suitability and availability for energy farming: a regional study Phase 2 report. Final report.** (Kingston, Reynolds, Thom and Allardice Ltd., Auckland (New Zealand)). Jul 1986. 202p. NTIS, PC PC E08/MF E01.

The report comprises Phase 2 of an extensive study into energy farming in the New Zealand context. It follows on from the

Phase 1 Report (NZERDC Publication p75), and is part of a research program aimed at assessing the potential contribution biomass conversion could make to meeting New Zealand's future transport fuel needs. The research considered the conditions necessary to sustain energy-farming implementation, the possible economic, social, and environmental implications, and developed and illustrated an assessment method suitable for adaptation in future regional studies.

15610 **(PNL—6141) Biomass Conversion Task IV 1987 program of work: International Energy Agency Bioenergy Agreement.** Stevens, D.J. (Pacific Northwest Lab., Richland, WA (USA)). Dec 1986. Contract AC06-76RL01830. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005238.

Biomass is a major, renewable energy resource through out the world, and extensive research is being conducted by many countries on bioenergy technologies. In an effort to improve communications and cooperation in the area of biomass energy, several nations have agreed to a cooperative program of work under the International Energy Agency's Bioenergy Agreement (IEA/BA). Three areas of major importance have been identified including Short Rotation Forestry, Conventional Forestry, and Biomass Conversion. This document describes the 1987 Program of Work for cooperative activities in the area of Biomass Conversion. The background of the cooperation and descriptions of specific conversion projects are presented. Details of activity funding are also provided. 3 tabs.

15611 **(SAND—86-2181C) Progress in photovoltaic concentrator research.** Arvizu, D.E. (Sandia National Labs., Albuquerque, NM (USA)). 1987. Contract AC04-76DP00789. 11p. (CONF-870307—10). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003511.

From ASME/JSME/ISES solar energy conference; Honolulu, HI, USA (22 Mar 1987).

This paper reviews the recent progress in photovoltaic concentrator research. In the past 18 months, several exciting new developments have been reported. Record efficiency concentrator silicon cells have been reported at Stanford University, with 28% efficient high resistivity cells, and at the University of New South Wales, with near 25% efficient low resistivity cells. Both groups also report record 22% one-sun efficiencies for these cells. Compound semiconductor cells have also made advances. Research on multijunction devices has led to a mechanically stacked concentrator cell with near 27% efficiency. Module improvements in commercial designs have taken the form of reduced cost and better component reliability. In addition, current research emphasis is on the development of new prototype modules that use the recent laboratory cell advances. Array efforts have centered around improving the tracking and control subsystems in accuracy, durability, and cost. Today, concentrator systems in high insolation areas are being offered at prices near $4/W/sub p/ ac for large MW sizes and at prices below those of flat plate systems ($8/W/sub p/) in hundred kW sizes. This paper will review these achievements and discuss the potential for concentrator technology to become a viable cost-effective bulk electrical power option.

15612 **(SAND—86-7051) Silicon solar cells with polysilicon contacts.** Christel, L.A. (SERA Solar Corp., Santa Clara, CA (USA); Sandia National Labs., Albuquerque, NM (USA)). Jan 1987. Contract AC04-76DP00789. 70p. NTIS, PC A04/MF A01; GPO Dep. File Number DE87005619.

A concentrator cell contact technology with improved minority carrier recombination properties was developed. Polycrystalline silicon (polysilicon) deposited by low pressure chemical vapor deposition and doped by phosphorus furnace diffusion was used in conjunction with a low resistivity base line n + /p silicon concentrator cell process. Test cells with contact coverages of 5, 10, 20 and 40% fabricated on low resistivity substrates showed saturation current densities which increased with increasing contact coverage when simple metal contacts were employed. With polysilicon contacts, the saturation currents were lower and decreased slightly with increasing contact coverage. The data suggest that the effective recombination velocity at the polysilicon/silicon interface is very low. The use of a chemically grown interfacial oxide beneath the polysilicon resulted in a small additional improvement. It is suspected that the saturation current of the best cells is dominated by the base component. Open circuit voltages of 645 to 650 mV were obtained on 0.17 Ω-cm float zone cells using contacts with a 2000 A layer of polysilicon and an interfacial oxide grown by RCA clean. Contact resistance values of 1 to 5 x 10^{-4} Ω-cm^2 were typical for polysilicon contacts doped by diffusion. Values as low as 5 x 10^{-5} Ω-cm^2 were obtained using rapid thermal annealing.

15613 **(SERI/SP—232-3079) Microalgae culture collection, 1986-1987.** Barclay, W.; Johansen, J.; Chelf, P.; Nagle, N.; Roessler, P.; Lemke, P. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1986. Contract AC02-83CH10093. 153p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE87005578.

The SERI Microalgae Culture Collection provides a repository for strains identified or developed for mass culture biomass production and makes these strains readily available to the research community. The strains in the collection have been selected for their potential in biomass fuel applications, and many produce significant quantities of cellular storage lipids. All of the newly added strains have been recently isolated by SERI and its subcontractors in organized screening programs. Many have been tested in outdoor mass culture systems, and several have demonstrated excellent performance as biomass producers. The strains added to the collection this year have been isolated from inland saline waters and marine waters. We believe that the strains in this collection can provide a source of extremely useful organisms, both for laboratory experimentation and for mass culture research. Most of the strains are currently nonaxenic. Again this year, cultures will be shipped free of charge to interested researchers. An important function of the culture collection catalog, in addition to listing the available strains, is to provide culture and performance data for each of the organisms. By collecting a summary of the requirements and characteristics of these organisms, we hope to allow requestors of cultures to begin productive research with a minimum of preliminary work on culture techniques.

15614 **(SERI/STR—211-3053) Research on multi-band-gap solar cells: Annual subcontract report, 1 April 1985-31 March 1986.** Cape, J.A.; Fraas, L.M.; McLeod, P.S.; Partain, L.D. (Chevron Research Co., Richmond, CA (USA); Solar Energy Research Inst., Golden, CO (USA)). Nov 1986. Contract AC02-83CH10093. 85p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87001133.

This report presents results of research on multi-band-gap solar cells. Investigators demonstrated controlled p-doping by carbon using TMGa, eliminating a need for Mg or Zn-doping. High-quality GaSb films were grown on substrates using TEGa and TESb. An EBIC-Schottky barrier technique was developed to characterize threading dislocations to qualify graded film structures. Higher film growth rates with more efficient Group-V utilization were achieved using a thermal cracker. A unique epitaxy technology, vacuum chemical epitaxy (VCE), was developed further. VCE results in good film uniformity from wafer to wafer and utilizes toxic gases much more sparingly and safely and expensive metal-alkyls more efficiently than conventional MOCVD. For some applications, it may be possible to avoid the most toxic gases altogether. These are significant advantages for safe, cost-competitive production of III-V devices in high volume. It was shown that high-quality solar cells can be fabricated using VCE.

15615 **Superlattice photoelectrodes for photoelectrochemical cells.** Nozik, A.J. (to Dept. of Energy, Washington, DC). US Patent 4,634,641. 6 Jan 1987. Filed date 3 Jul 1985. vp.

This patent describes a photoelectrochemical cell apparatus, comprising first photoelectrode means for injecting charge carriers into an electrolyte and second electrode means for injecting oppositely charged carriers into the electrolyte. The first electrode means includes a superlattice semiconductor.

15616 (SAND—85-7018/1) Evaluation of international photovoltaic projects: Volume 1, Executive summary. Eskenazi, D.; Kerner, D.; Slominski, L. (Meridian Corp., Falls Church, VA (USA); Sandia National Labs., Albuquerque, NM (USA)). Sep 1986. Contract AC04-76DP00789. 48p. NTIS, PC A03/MF A01; GPO Dep. File Number DE87005178.

A comprehensive review and financial analysis are provided for photovoltaic power systems for remote applications in developing countries. Volume I, the Executive Summary, provides an overview of all findings; Volume II, the Technical Report, covers the methods of analysis used and the results obtained. Five application areas are included: water pumping, communications, vaccine refrigeration, lighting and home power, and multi-use systems. Findings are based on qualitative reviews of more than 2700 systems in 45 countries. Information was collected from published reports, questionnaires, and interviews with key experts. Site visits were not within the scope of this evaluation. The intended audience of this report are development agency officials, manufacturers, and users. Based on "lessons learned" from past projects, recommendations are provided for project implementation. In addition, financial analyses allow decision makers to use their own assumptions to obtain a first-order indication of the financial attractiveness of photovoltaic systems for each application. This report also provides industry with an assessment of product performance and suggested areas for additional improvements.

15617 (SAND—86-0272C) PVFORM Version 3.2: a PV simulation program for mini and micro computer systems. Second version. Menicucci, D.F. (Sandia National Labs., Albuquerque, NM (USA)). [1986]. Contract AC04-76DP00789. 12p. (CONF-870373—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87002052.

From National conference on microcomputer applications for renewable energy; Honolulu, HI, USA (3 Mar 1987).

PVFORM is a new photovoltaic (PV) system simulation program that integrates improved modelling techniques into a simplified program that can be run on computers ranging in size from a mainframe to a personal computer. PVFORM is designed to simulate the hourly performance of a PV flat-plate grid-interactive, stand-alone or hybrid system for a one year period. The code is based on simple but accurate approaches to modelling the insolation in the plane of the array, array thermal behavior, and power production portions of a PV system. This paper briefly discusses the theory and operation of the major features of PV system modelling and describes how these features have been integrated into the PVFORM model. Also included are results of some of the SNLA field tests being used to verify the accuracy of the PVFORM grid-interactive model. A major portion of the paper is devoted to describing applications of the PVFORM model to the design, testing, and evaluation of PV systems including some examples of how to use PVFORM to optimize the configuration of stand-alone PV/battery systems.

1407 Solar Thermal Power Systems

15618 (BMFT-FB-T—86-087) Technology program 'Gas-cooled Solar Tower Plant' (GAST) - analysis of the potential. Final report. Becker, M.; Dunker, H.; Bucher, W.; Kalt, A.; Sharan, H.N.; Wehowsky, P.; Stahl, D.; Meinecke, W.; Franzke, G.; Leuchs, U. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.); Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.)). Dec 1986. 372p. (In German). NTIS (US Sales Only), PC A16/MF A01. File Number DE87751310.

The goal of the technology program 'Gas-cooled Solar Tower Plant' (GAST), which is carried out in the framework of the bilateral common project between the Federal Republic of Germany and Spain (duration from 1981 to end of 1986), is the determination of technical and economic reliability of the solar specific components heliostat, receiver and hot gas pipes. On the basis of a 20 MW lead concept, technical investigations and laboratory tests were carried out. Experiments, taking local and environmental conditions into consideration, are in progress at the test facilities on the Plataforma Solar in Almeria, Spain. To assess the test results as well as to design future GAST plants with different power and economic optimizations, sufficient auxiliary technical systems with computer programs were developed. Comparing the different systems such as solar tower plants, other solar plants (Farm, PV, Wind) and conventional plants (oil, coal, nuclear), the main investigation is concentrated on the different solar tower plants. The above mentioned different solar plants are defined technically and economically in such a way that the approximate yearly energy production as well as the specific energy costs can be calculated (cash value method, price basis of 1984, start of work: 1990). All different solar plants are considered as first plants. Due to meteorological reasons, California was chosen as the comperative site. The results and analyses of the technological program determine that the GAST concept is technically realistic and can be realized for electric power generation as well as for the utilization of solar thermal heat for high temperature processes. With 88 refs., 94 tabs., 101 figs.

15619 (DOE/JPL/1060—96) Solar Stirling receiver alternatives for the terrestrial solar application. Stearns, J. (Jet Propulsion Lab., Pasadena, CA (USA)). 30 Apr 1986. Contract AI04-80AL13137. 30p. (JPL-PUB—86-13). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005431.

Concept studies have been completed for four dish-Stirling receivers: the solar only and thermal storage receiver, each of which is either directly coupled or indirectly (heat pipe) coupled to the Stirling engine. The results of these studies are to be applied to systems benefit/cost analysis to determine the most desirable development approach.

15620 (SAND—86-8187) 10 MWe Solar Thermal Central Receiver Pilot Plant control system description. (McDonnell Douglas Astronautics Co., Huntington Beach, CA (USA); Sandia National Labs., Livermore, CA (USA)). Dec 1986. Contract AC04-76DR00789. 147p. NTIS, PC A07/MF A01; 1; GPO Dep. File Number DE87005582.

This report describes the control system for the 10 MWe Solar Thermal Central Receiver Pilot Plant located near Barstow, Ca. The plant, called Solar One, is a cooperative activity between the Department of Energy and the Associates: Southern California Edison, the Los Angeles Dept. of Water and Power and the California Energy Commission. This report provides an overview of the plant control system including the rationale for the design approach and the configuration which resulted in response to program requirements.

15621 (ESA-TT—61) Measurement of radiation intensity at the solar tower plant SSPS/CRS of the IEA in Spain. Brinner, A. (European Space Agency, 75 - Paris (France)). Jan 1986. Translated from Strahlungsintensitaets-Messung am Solarturmkraftwerk SSPS/CRS der IEA in Spanien Stuttgart, West Germany. (DFVLR-FB—85-36; ETN—86-98246). 42p. NTIS, PC A03/MF A01; original German version avail. at DFVLR, Cologne, West Germany DM 15.

The Kendall MK9 radiometer was selected to measure the radiation intensity on the IEA SSPS/CRS solar tower plant in Spain. The measuring signal was applied to calibrate a video camera used for measurement of power density distribution in the aperture of the solar absorber. The measurement results were used to show a relationship between the gray values of a video picture of the ASR receiver under radiation and the absolute radiation intensity measured at three points so as to calculate the absolute irradiation in MW. The tests show good reproducibility and high accuracy. The conversion factors were applied to calculate the flux distribution, the maximum flux and the ASR receiver efficiency.

1409 Solar Thermal Utilization

15622 **(ORNL—6359) PCMSOL: Simulation code for a passive solar structure incorporating phase change materials.** Drake, J.; Geist, A.; Martin, J.; Serbin, C.; Solomon, A.; Tomlinson, J.; Grodzka, P.; McCormick, P.; Price, J.; Brown, S. (Oak Ridge National Lab., TN (USA)). Jan 1987. Contract AC05-84OR21400. 40p. NTIS, PC A03/MF A01; GPO Dep. File Number DE87005292.

In order to study the optimum properties, utilization and economics of phase change materials (PCM) in a direct gain passive solar structure a computer simulation, PCMSOL, has been developed. This program, modeling a one room home, permits the incorporation of PCM's and/or other high thermal mass materials in the walls. The theory and basic relations used in the code are given. Some sample runs are discussed. The program is validated by comparison with data from an experimental passive solar structure in Huntsville, Alabama.

15623 **(PB—87-109161/XAB) In-situ performance of solar water heaters: a testing programme. Final report.** (Synergy Applied Research Ltd., Wellington (New Zealand)). May 1986. 63p. NTIS, PC PC E04/MF E01.

The objectives of the study were to (1) design an experimental and monitoring program to determine the in-situ performance of the SWH systems commonly being installed in the field, (2) conduct a comprehensive literature search and to design experiments to determine the performance of the state of the art equipment, i.e., to give an indication of future performance, and (3) design systems instrumentation and research methodology required to provide meaningful long-term performance and systems-reliability data.

1410 Solar Collectors And Concentrators

15624 **(N—87-11838) Effect of hard particle impacts on the atomic oxygen survivability of reflector surfaces with transparent protective overcoats.** Gulino, D.A. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1986. 22p. (NASA-TM—88874; E—3281; NAS—1.15:88874; CONF-870133—3). NTIS, PC A02/MF A01.

From 25. AIAA aerospace sciences meeting; Reno, NV, USA (12 Jan 1987).

Silver mirror samples with protective coatings were subjected to a stream of 27 microns alumina particles to induce pinhole defects. The protective coating consisted of a layer of aluminum dioxide over silver followed by a layer of silicon dioxide over the alumina. Samples were prepared on both graphite-epoxy composite and fused quartz substrates. After exposure to the hard particle stream, the samples were exposed to an oxygen plasma environment in a laboratory plasma asher. The effects of both the hard particles and the oxygen plasma were documented by both reflectance measurements and scanning electron microscopy. The results indicated that oxidative damage to the silver reflecting layer continues beyond that of the erosively exposed silver. Oxidative undercutting of the silver layer and graphite-epoxy substrate continues in undamaged areas through adjacent, particle damaged defect sites. This may have implications for the use of such mirrors in a space station solar dynamic power system.

15 GEOTHERMAL ENERGY

1501 Resource Status And Assessment

15625 **(DOE/ID/12543—2) Low-temperature geothermal assessment of the Santa Clara and Virgin River Valleys, Washington County, Utah.** Budding, K.E.; Sommer, S.N. (Utah Geological and Mineral Survey, Salt Lake City (USA)). 1986. Contract FG07-84ID12543. 48p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004787.

Exploration techniques included the following: (1) a temperature survey of springs, (2) chemical analyses and calculated geothermometer temperatures of water samples collected from selected springs and wells, (3) chemical analyses and calculated geothermometer temperatures of spring and well water samples in the literature, (4) thermal gradients measured in accessible wells, and (5) geology. The highest water temperature recorded in the St. George basin is 42°C at Pah Tempe Hot Springs. Additional spring temperatures higher than 20°C are at Veyo Hot Spring, Washington hot pot, and Green Spring. The warmest well water in the study area is 40°C in Middleton Wash. Additional warm well water (higher than 24.5°C) is present north of St. George, north of Washington, southeast of St. George, and in Dameron Valley. The majority of the Na-K-Ca calculated reservoir temperatures range between 30° and 50°C. Anomalous geothermometer temperatures were calculated for water from Pah Tempe and a number of locations in St. George and vicinity. In addition to the known thermal areas of Pah Tempe and Veyo Hot Spring, an area north of Washington and St. George is delineated in this study to have possible low-temperature geothermal potential.

15626 **(GB—55) Heat flow and regional groundwater flow in the United Kingdom. Investigation of the geothermal potential of the UK.** Gale, I.N.; Downing, R.A. (British Geological Survey, Keyworth. Geothermal Resources Programme). 1986. 22p. British Library, Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

The area-weighted mean background heat flow in the United Kingdom is about 52mW/m^2, but values range from less than 40 to more than 120mW/m^2. The most pronounced heat flow anomalies are associated with granites where the regional heat flow is supplemented by high heat production from the decay of radioactive isotopes. Significant regional anomalies also occur in major sedimentary basins in the East Midlands of England, in Hampshire, in Gloucestershire and in the Midland Valley of Scotland. Thermal springs in Somerset, South Wales and Derbyshire are caused by the deep circulation of meteoric waters in the Carboniferous Limestone. They give rise to small thermal anomalies of local significance and occur in areas that are not part of the regional anomalies.

1502 Geology And Hydrology Of Geothermal Systems

15627 **Geologic and hydrologic research on the Moana geothermal system, Washoe County, Nevada.** Flynn, T.; Ghusn, G. Jr.; Trexler, D.T. (Univ. of Nevada, Las Vegas). *Geo-Heat Center Quarterly Bulletin;* 8: No. 2, 3-6, 17(Win 1984). Contract FC03-80RA50075.

The Moana geothermal area, located in southwest Reno, is the largest single low- to moderate-temperature geothermal resource in Nevada presently employed for direct-use applications. Approximately 150 individual wells, representing a total estimated investment of $5 to $7 million, are presently used to provide heat and hot water to more than 130 private residences, several churches and two large motels. Although most of the wells are constructed to meet the heating needs of individual homes, a large-scale district space heating system, designed to supply heat to 60 houses from a single well, is now being developed. Usable temperatures range from 50 to 99 C; well depths range from 60 to 400 m. Development of the resource has been largely unregulated and questions dealing with reported reservoir temperature and water level declines, loss of artesian flow, and fluid disposal have recently surfaced. In October, 1982, a geologic and hydrologic research program began that was designed to provide detailed geothermal reservoir data to present or prospective developers. The program combines geophysical, geochemical, and geological surveys of the Moana resource area with a drilling program for 5 monitor/observation wells. Data from this program are supplied directly to developers as well as state and local government agencies to provide for prudent resource development. This paper summarizes the program elements and describes the present status. 9 references.

1503 Geothermal Exploration And Exploration Technology

REFER ALSO TO CITATION(S) 15625, 15625

15628 (GB—56) Further investigations of the UK heat flow field (1981-1984). Investigation of the geothermal potential of the UK. Wheildon, J.; Gebski, J.S.; Thomas-Betts, A. (British Geological Survey, Keyworth. Geothermal Resources Programme). 1985. 19p. British Library, Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

Twenty nine new determinations of the vertical component of conductive terrestrial heat flow have been made. The results of this study modify the boundaries of the high heat flow belt across northern England. The belt is not continuous, but consists of a series of isolated regions of above average heat flow. In southern England, three strategically located heat flow sites have demonstrated that the high heat flows in south-west England and the Hampshire Basin occur as separate anomalies and are not linked as a single belt, as was formerly supposed.

1520 Geothermal Data And Theory

15629 (NP—7770053) Experimental investigations of the reaction between albite and acid hydrothermal solutions. Toepfer, U. (Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Bio- und Geowissenschaften). 22 May 1985. 143p. (In German). NTIS (US Sales Only), PC A07/MF A01. File Number DE87770053.

To extract geothermal heat from granite or gneiss, a heat exchange medium must be injected into the rock strata. Flooding with an aqueous solution causes the mineral to react with the solution, inducing dissolution of the mineral or a formation of secondary mineral phases. The dissertation investigates these two possibilities. The author describes the experimental set-up (pH meter, scales, autoclaves, X-ray diffractometer, atomic absorption spectrometer, SEM, and energy-dispersive X-ray analyzer), the experimental acquisition of data, the initial material, and the dissolution of albite at different pH and with additions of different elements. Investigations of the secondary mineral phase are reported, and experimental results are compared. Hints are given on the geothermal application of the experimental findings, e.g. the required acidity of the exchange medium and the necessary time of contact with the rock.

15630 (SAND—87-0073C) Magma energy extraction. Dunn, J.C.; Ortega, A.; Hickox, C.E.; Chu, T.Y.; Wemple, R.P.; Boehm, R.F. (Sandia National Labs., Albuquerque, NM (USA); Utah Univ., Salt Lake City (USA)). 1987. Contract AC04-76DP00789. 9p. (CONF-870136—4). NTIS, PC A02. File Number DE87005068.

From 12. workshop on geothermal reservoir engineering; Stanford, CA, USA (20 Jan 1987).

The rate at which energy can be extracted from crustal magma bodies has an important influence on the economic viability of the magma energy concept. Open heat exchanger systems where fluid is circulated through solidified magma offer the promise of high energy extraction rates. This concept was successfully demonstrated during experiments in the molten zone of Kilauea Iki lava lake. Ongoing research is directed at developing a fundamental understanding of the establishment and long term operation of open systems in a crustal magma body. These studies show that magma solidifying around a cooled borehole will be extensively fractured and form a permeable medium through which fluid can be circulated. Numerical modeling of the complete magma energy extraction process predicts that high quality thermal energy can be delivered to the wellhead at rates that will produce from 25 to 30 MW electric.

16 TIDAL AND WAVE POWER

1608 Wave Energy Converters

15631 (ETSU-WV—1668(P3)) Long spines with appendages. A report to the Wave Energy Steering Committee covering work supported by the United Kingdom Department of Energy. (Edinburgh Univ. (UK); UKAEA Atomic Energy Research Establishment, Harwell. Energy Technology Div.; Department of Energy, London (UK). Wave Energy Steering Committee). 1986. 76p. British Library, Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

Experimental investigations into the effects of adding appendages to the Edinburgh spine model are described. The appendages comprised corners, fins, decks - plastic foam layers added to the top surface of a squared-off spine to give a range of freeboard, skins - plastic foam layers wrapped round the spine to increase radius, and harbours -rectangular plates mounted normal to the spine. The decks were tested in a range of mixed seas in the freeboard experiments. The other configurations were tested for their response to wave frequency and angle, and for their performance in the 46 spectra representing the annual wave climate off South Uist. Tests were performed at two spine stiffnesses. The plain spine was tested under the same conditions for comparison.

17 WIND ENERGY

15632 Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). 540p. (CONF-850834—). American Wind Energy Assoc., 1516 King St., Alexandria, VA Alexandria, VA.

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

This book presents the papers given at a conference on wind turbines. Topics considered at the conference included resource assessment, wind tunnel testing, vertical axis turbines, wind turbine generators, aerodynamics, airfoils, wind loads, Darrieus rotors, economics, legislation, regulations, environmental impacts, national and international programs, fatigue testing, and horizontal axis turbines.

1701 Availability (climatology)

15633 A low cost and easy to reproduce anemometer for basic wind data acquisition. Borja, M.A.; Parkman, P.; Caldera, E. (Instituto de Investigaciones Electricas, Apartado Postal 475, C.P. 62000, Cuernavaca, Morelos). pp 397-401 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

At the Instituto de Investigaciones Electricas (Electrical Research Institute) of Mexico, a commercial calculating machine was used to design a low cost anemometer which is programmable by the simple introduction of a constant of proportionality at the beginning of system's operation. With this equipment one can also get the wind direction in a coded form in 8 different directions. The equipment is called APTI-2-IIE and has 30 day-information capacity. Since it is actually a pulse counter, it is very suitable to the data acquisition of other variables. The equipment has proved to be reliable during continuous operating tests under different and rigorous climatological conditions. Its reproduction, calibration, installation and operation are simple.

15634 Wind characteristics, northwest Texas region. Gilmore, E.H. (Alternative Energy Institute, West Texas State Univ., Canyon, TX). pp 406-410 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

A wind monitoring system of ten stations has been developed over the period 1978-81 and spans a 250,000 sq km(100,000 sq

mi) region of northwest Texas. Wind speeds have been sampled at 10, 20, and 50 meters at frequencies of 0.5 and 1 Hz. Four locations had overall average power densities at 50 meters in the range from 414 to 450 watts/sq meter. These values are about 50% greater than those measured at the next group of sites, namely, Dalhart, Stanton, and Childress. The four locations with highest average power density values lie nearly on a straight line from the southwest Texas panhandle to its northeast corner. Nighttime average windspeeds generally exceed day values at 50 meters, but there is little difference in average power density values. Wind shear exponents range from 1/9 to 1/6 during daylight at these four stations to about twice these values at night. Combined day night values are from 1/6 to 1/4, which are somewhat larger than the values 1/7 to 1/6 most often used.

15635 **Significance of upper air meteorological conditions in Altamont Pass wind resource assessment.** Burda, T.J.; Wilson, J.W.; Hiester, T.R.; Germain, A. (Stone & Webster Engineering Corp., Boston, MA). pp 402-405 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Because a long-term surface wind data base is not available in the Altamont Pass area, it is difficult to judge whether wind data collected at a particular site are representative of the long-term condition. Using a multiple regression technique, a model was developed which predicts the average daily wind speed at a site in Altamont Pass as a function of the zonal (west-east) wind component at approximately 550 m (1800 ft) above Oakland, CA and the daily maximum San Francisco surface air temperature. The model was applied to the July long-term National Weather Service data base to estimate the monthly average wind speed at the Altamont site dating back to 1953. A discussion of the monthly dependence, limitations, confidence limits, and applicability of the model to estimate the long-term representativeness of the Altamont site wind data is presented.

15636 **Missing data: How does it affect the accuracy of key wind statistics.** Baker, R.W.; Chu, P.S. (Wind Resource Assessment Lab., Dept. of Atmospheric Sciences, Oregon State Univ., Corvallis, OR). pp 391-396 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Accurately evaluating the wind power potential at potential wind power development sites is often complicated by the fact that the hourly wind speed records collected are incomplete. Missing data is an unfortunate 'fact of life' in wind resource assessment. Rarely are the annual data recovery rates above 90% and typically they are in the 75-85% range. The question then arises as to the representativeness of the collected data to give an accurate estimate of the actual wind statistics. This paper focuses on the impact of missing data on estimating the wind power resource. Complete wind speed sets of hourly data over a one year period are analyzed at 10 sites. Wind speed data are systematically removed from the data sets and the mean statistics of wind speed, power density, and estimated wind turbine generator (WTG) energy output from the incomplete and complete data sets are compared on an annual basis. The Critical Levels for data recovery at each site are calculated to give an accuracy within +-5%, +-10% and +-15% to the actual mean value with a 90% Confidence Limit. There was a good relationship between the Critical Levels and the variations in the mean monthly wind speed, power density, and estimated WTG energy output (i.e., the annual Coefficient of Variation, COV). The analysis of the mean wind speed COV's at several wind power development areas revealed that the Critical Levels of data recovery ranged from 72% at Goodnoe Hills to 83% at Altamont Pass. With respect to the mean annual power density and WTG energy output the Critical Levels need to be at least 10 percentage points greater that the mean annual wind speed Critical Levels.

1704 Economics

15637 **Beyond 1985: New market development.** Ceci, R.M. (Remy Ceci Consulting, Sacramento, CA). pp 237-241 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

The market for investments in wind energy is changing rapidly. Whether in response to the potential loss of the tax credits and other financial incentives, or driven by the increasing sophistication of the investment community, wind turbine manufacturers and windfarm developers have had to reassess traditional investment vehicles that no longer meet the needs of a growing number of capital resources. In addition, new markets, both domestic and abroad, offer new marketing options that must be addressed with increased flexibility and creativity by the companies aggressively seeking those markets. This paper discusses several of the options available to today's wind energy companies as they meet the challenges inherent in this volatile marketplace.

1706 Wind Energy Engineering

15638 **Wind energy activities in Sweden.** Engstrom, S. (National Energy Administration, Stockholm). pp 348-352 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

In the 1975-1984 period the national Swedish wind energy program concentrated on the construction and evaluation of two large WECS, Maglarp 3 MW and Nasudden 2 MW. A total of MSEK 265 of Government-funds has been used, of which some MSEK 180 was devoted to the prototypes and the remaining MSEK 85 for basic research and general evaluation activities. Substantial sums also were invested by the manufacturing industry. By the end of 1984 the National Energy Administration of Sweden completed an evaluation report on wind power. The main results are presented here. In February 1985 the Government presented a bill on the future energy policy which also covered the future for wind power in Sweden. Presently negotiations concerning the financing of the next development step are taking place.

15639 **Canadian wind energy R & D.** Chappell, M.S. (Div. of Energy, National Research Council, CA). pp 363-368 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

The current status of Canadian wind energy research and development projects is outlined. Resource assessment based on long-term meteorological data is substantially complete. Work continues on analytical and wind tunnel techniques for siting. Technology development remains focused on the Darrieus vertical axis wind turbine. Performance prediction methods are well advanced but better understanding and mathematical modelling of dynamic stall is required. Structural dynamic modelling and fatigue stress analyses have progressed to within acceptable accuracies. 50 kW grid-coupled and wind-diesel field trial projects continue to provide valuable operating experience to both researchers and utilities. Prototype 125 kW and 500 kW VAWT's are undergoing comprehensive performance and structural testing at the Atlantic Wind Test Site. A large waterpumping HAWT is also being evaluated. Components for the experimental 4 MW VAWT are being fabricated and the civil and electrical engineering works at the site in Quebec are nearly completed. The government has recently decreed that NRC will cease activity in wind energy R & D. It is hoped that

beyond April 1986, other Canadian government agencies will continue certain thrusts of the current program.

15640 **Meteorological aspects of the wind farm feasibility study at Cape Blanco, Oregon.** Wade, J.E.; Baker, R.W.; Butler, N.G.; Duncan, A. (Wind Resource Assessment Lab., Oregon State Univ., Corvallis, OR). pp 417-422 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

A wind farm feasibility study was conducted on a 1500 acre site near Cape Blanco, Oregon. This study had five main elements: preliminary site analysis; engineering, environmental impact analysis; licensing; permitting and administrative process and meteorological assessment. This paper describes the meteorological element of this study. The field assessment methodology utilized wind measurements from fixed location meteorological towers, mobile towers and kite anemometers to evaluate spatial and temporal variations in the wind. Turbine performance and energy estimates were evaluated for five different wind turbines. Estimates of energy output for the various wind turbines are compared. Estimates of mean speed on the site when referenced to the 8 year period of record at Cape Blanco were found to be 16% lower than estimates based on a 35 year record that included data from the Coast Guard Light Station at Cape Blanco. This trend of weaker winds from 1976 to 1983 was also noted in several other locations in western Oregon.

15641 **Wind energy utilization status of research and development in the Federal Republic of Germany.** Windheim, R. (Nuclear Research Establishment Julich, P.O. Box 19 13, D-5170 Julich). pp 381-386 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Most of the Wind Energy R & D activities of the Federal Republic of Germany are covered by the Program for Energy Research and Technologies of the Minister of Research and Technology. It follows the general objective to develop reliable and economically viable wind energy conversion systems and to stimulate the commercialization of wind power. Realistic site evaluation shows that the wind energy potential in the Federal Republic of Germany is notable. Many projects are or were supported by the program with a total amount of more than 200 mill. DM. They follow two aims: 1. Electricity generation by small scale (up to 50 kW), medium scale (several 100 kW) and large scale machines (several MW); and 2. Adaptation of small and medium scale machines for special applications. The status of R & D projects is presented. It supports the objective to utilize the wind as one promising way in the scenario of renewable energy sources.

15642 **Windfarm noise issues and impacts.** Allen, G.M. (Michael Brandman Associates, Inc., Costa Mesa, CA). pp 315-322 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Despite its benefits as an alternative energy source, commercial windfarming is losing acceptability because of latent noise and land use compatability conflicts. In the San Gorgonio Wind Resource Area, three issue areas arose: (1) measurement techniques; (2) prediction assumptions and methodology and; (3) acceptability levels. The authors' recommendation for measuring a turbine's noise level for prediction purposes is multifaceted. Measurements should be made at various azimuth positions under a range of operating conditions at distances calculated as functions of the dimensional characteristics of the turbine. A-weighted and one-third octave band measurements should be made with standard equipment with the microphone placed at five feet above ground level. Narrowband measurements in the low frequency and infrasound region should be made with the microphone at ground level to minimize the effects of pseudo noise. The data will still often require processing in a Fast Fourier Transform Analyzer to distinguish turbine from pseudo or background noise. Noise prediction is accomplished via distributed array computer modeling incorporating propagation parameters. To use the model as a planning tool, the authors recommend a divergence loss factor of 20 log of the distance ratio, an atmospheric absorption factor based on the turbine's frequency spectra and local humidity/temperature conditions; and a ground absorption loss of 0.5 - 1.0 dB per 1,000 feet depending on whether it is a horizontal or vertical axis turbine. Acceptability levels should be attached to the ambient noise because of the wind-affected character of a wind resource area. Allowable noise should be no greater than 6 dB less than the ambient and low frequency, impulsive noise should not exceed NASA criteria. Pure tone components should not exceed the California Model Noise Control Ordinance specifications.

15643 **Permitting windfarms in California: Environmental impacts, local regulations, developer responsibility.** McClendon, R.E.; Duncan, R.A. (FloWind Corp., Pleasanton, CA). pp 305-314 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

This presentation is an insight of the state of the industry in regards to the ability of the industry in regards to the ability of the industry to work with the local government and the community it serves. The areas of investigation are: what the local regulations were when wind energy got its start; what the environmental concerns were of the local government and the community it serves; what the developers' responsibilities were to the local community; and who else was the developer responsible to. As the infant industry started developing wind farms the public attitude began to change and their concerns were voiced to the local government. Hence today the development atmosphere has changed and the developers are beginning to take a more active role in shaping their destiny by working with the citizens and the local governments by: addresses the environmental issues; working more closely with the local government; and meeting with citizen groups to reconcile differences.

15644 **Environmental noise considerations for the siting and operation of wind energy farms.** Shepherd, K.P.; Hubbard, H.H. (The Bionetics Corp., Hampton, VA). pp 299-304 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

The basic phenomena of noise generation, noise propagation and the effects of noise are reviewed for wind turbine generators in single machine and multiple machine configurations. The roles of individual machine noise spectra and directivity patterns are discussed along with pertinent frequency weighted noise metrics. Special attention is given to the effects of the wind. The results of sensitivity studies are described to indicate the impact of machine sizes and geometric arrangements on the noise level predictions. Example noise contour calculations are presented to illustrate the effects of changes in machine size and spacing, row length, number of rows and total number of machines as a function of distance and direction from the arrays.

15645 **Wind park electrical testing by Southern California Edison.** Yinger, R.J. (Southern California Edison Co., Rosemead, CA). pp 294-298 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

As part of the Southern California Edison Company (SCE) wind energy program, the electrical characteristics of private developer-owned wind parks and their effects on the local SCE transmission and distribution system are being investigated. Measurements of megawatts, megavars, voltage and current are being made at selected wind park interconnect points. From these data, wind park output fluctuations, voltage regulation and power factor are determined. Synchronous operation of wind turbines are also being investigated. Future studies will include more analysis of existing data and measurements at more wind parks in other regions.

15646 **Integrating wind energy into the electric utility system.** Stock, J.; Cheng, M.L. (Southern California Edison Co., Advanced Engineering Dept., Research and Development, P.O. Box 800, Rosemead, CA). pp 287-293 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

This paper discusses some of the dynamics of wind power generation as it may impact Southern California Edison's planning, transmission and operating functions. The use of a peak power ratio for planning and the effect of dispersed wind energy generating stations (WEGS) are described. Short-term wind power fluctuations are evaluated and related to Edison's operating system capabilities. A wind power prediction model is discussed and a preliminary method for converting wind speed to regional power output is presented.

15647 **Progress and problems in wind energy research and development in Hawaii.** Neill, D.R.; Takahashi, P.K. (Hawaii Natural Energy Institute, 2540 Dole St., Holmes Hall 246, Honolulu, HI). pp 265-279 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Hawaii has one of the best proven wind energy resources in the world. There has been significant progress in the past year by the utilities and wind farm developers toward developing this great wind resource. But wind energy development in Hawaii has not been as aggressive as in California for a number of reasons that are discussed in this paper. This paper reports on the progress in wind energy development in Hawaii, highlighting accomplishments such as the installed wind farms to date and those that should be completed by the end of 1985 (e.g. two 9 MW wind farms at Kahuku, Oahu, using Westinghouse's 600 kW machines and DAF-Indal 500 kW VAWTs, two 10 MW wind farms at South Point, Hawaii, one consisting of Carter Wind System 250 kW machines, and the other using Danish wind machines, etc.). A report is given on the various actions of the utilities, decisions by the Hawaii Public Utilities Commission and the State Legislature, and an avoided cost methodology study by the State of Hawaii Department of Planning and Economic Development. The second part of the paper describes the research programs underway at HNEI on utility interface problems, exploring the role of diesel systems, and other activities, which include a wind energy battery storage pilot demonstration project, studies on other wind energy storage options such as pumped-storage-hydro, compressed air, hydrogen, and research on wind forecasting, and non-utility-dependent uses of wind power.

15648 **Review of standards/codes of practice related to safety and reliability of wind energy conversion systems.** Beurskens, J.; Frandsen, S.; Lundsager, P.; Pedersen, B.M. (Netherlands Energy Research Foundation ECN, Petten). pp 255-264 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Within the framework of the IEA-R&D-WECS Programme a working group involved in establishing recommended practices for wind turbine testing and evaluation has reviewed draft standards/codes of practice related to safety and reliability of WECS. The review was made on the basis of documents from formal national standards committees at the stage of development reached by April 1985. The review is based mainly on documents from Canada, Denmark, Federal Republic of Germany, The Netherlands, USA and Sweden. The documents used in the review are listed and some comments are given. Some standards are based on codes of practice that are currently being enforced by licensing or other authorities, thereby reflecting the design of WECS built today. A general overview of safety standards is given.

15649 **Pacific Gas and Electric Company's wind energy program results.** Smith, D.R.; Steeley, W.J.; Ilyin, M.; Hillesland, T. Jr. (Pacific Gas and Electric Co., San Ramon, CA). pp 280-286 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Pacific Gas and Electric Company (PG and E) has gained valuable experience with wind generation of electricity both by operation of its own 2.5 megawatt turbine, and as the host utility for the output of the privately owned wind farms in Altamont Pass, the largest collection of wind turbines in the world. Since September 1982 PG and E's Department of Engineering Research has been involved in a program to evaluate the Solano wind turbine's performance and environmental impacts. The program was cosponsored by the Electric Power Research Institute. Some of the results are highlighted in this paper. PG and E also tracks the performance of the Altamont wind farms, comprising over 4000 turbines with an installed capacity of about 350 MW. These farms include turbines ranging in rating from 40 to 400 kW and rotor diameters from 10 to 31 meters (33 to 103 ft.). Overall capacity factor has improved each year so far, and results through the first half of 1985 are reported. The performance of the Altamont wind turbines during system peak load times are discussed. Other trends and developments of the Altamont turbines taken as a composite power plant are also reported.

15650 **Wind farm economics from a utility perspective.** Pepper, J.C. (Pacific Gas and Electric Co., San Francisco, CA). pp 248-254 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Purchases from third-party wind developers make up a portion of PG & E's planned resource additions over the next 10 years. Avoided costs, the price paid for energy and capacity deliveries from third-party developers, play a very important part in wind farm economics. Actual avoided costs are shown for the last few years to illustrate their fluctuation. Their calculation is explained. Correlations between the energy output in the peak, partial-peak and off-peak time period are shown by month for 1984. This gives an indication of the pattern of wind energy production within the PG & E system. The resource planning methodology used within PG & E to forecast the amount of wind development by Qualifying Facilities (QFs) from the QF's perspective is explained and the sensitivities to installed cost, wind speed and tax credits are shown.

15651 **Wind energy activities in Denmark.** Nielsen, P. (DEFU, Lundtoftevej 100, DK-2800 Lyngby). pp 353-358 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

So far, the design and erection of the two 40 m/630 kW turbines (A and B) at Nibe has been the main achievement of the Danish wind power programme. In January 1984, three new wooden blades were installed on the B turbine, and since then this machine has operated with higher availability than ever (86%). Recently five turbines of modified Nibe B design (40 m/750 kW) were ordered by ELKRAFT to be built on Zealand with commissioning in 1986. In Jutland, ELSAM is going to install an improved and enlarged version of Nibe B (60 m/2 MW). The scheduled time for commissioning is mid-1987. Between 1200 and 1400 small-scale turbines have been installed in Denmark in recent years. By the end of 1984, the corresponding number of Danish wind turbines in the USA was about 2000 units, and around 2500 are expected to follow in 1985.

15652 **Optimizing output of a wind-driven alternator using microprocessor control.** Soderholm, L.H. (Iowa State Univ., Ames, IA). pp 343-347 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Efficiency of a wind-system rotor is dependent on the ratio of the rotational or tip speed to the wind speed driving it. Unless some provision is made for varying the rotor speed or pitch, optimum tip-speed/wind speed (TS/WS) ratios normally will not be maintained over a wide range of wind speeds, and less than optimum power output will result. Fixed-pitch rotors offer a number of

design and cost advantages but will not provide maximum power output over a wide range of wind speeds unless some provision is made to optimize the TS/WS ratio. An approach for performance improvement of fixed-pitch wind system using microprocessor control of an alternator field is described. Data indicate that such an approach can result in power-output improvements of 12% to 47% over normal operation for a typical wind system and thus enhance the economic viability of fixed-pitch wind systems for many applications.

15653 **Structural dynamics considerations in wind turbine rotor design.** Stoddard, F.S. (Pioneer Wind Power, Inc., Amherst, MA). pp 337-342 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

This paper briefly describes an analytical method for the simple calculation of wind turbine rotor blade dynamic loads due to wind speed, gravity, and perturbations due to yaw rate, crosswind, and wind shear. The method has been developed from the classical helicopter approach of modeling the fundamental blade structural frequencies in flapping and lead-lag with equivalent hinge-spring blade models. An algebraic approach is taken in order to gain physical insight into the dynamic behavior of wind turbine rotors. An example calculation is presented for a 12-meter diameter rigid rotor. The paper ends with a discussion of blade coning, cyclic load response and input, and rotor yaw stability.

15654 **Modal testing in the design evaluation of wind turbines.** Lauffer, J.P.; Carne, T.G. (Sandia National Labs., Albuquerque, NM). pp 323-332 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—). Contract AC04-76DP00789.

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Modal testing of wind turbines can be fairly difficult because placing transducers on tall structures and providing low frequency excitation create problems. Moderate-size turbines are 100 to 200 feet tall, and their modal frequencies are very low, 0.1 to 5.0 Hz. In the mini-modal concept, only a limited number of response measurements are used in conjunction with a reasonably accurate finite element model to determine the modal parameters. Several techniques of low frequency excitation were explored, including impact, wind, step-relaxation, and human input. In tests using the mini-modal concept with human excitation, modal frequencies of large turbines have been determined in less than one day. As one application of these techniques, a prototype turbine was tested and two modal frequencies were found to be very close to integral multiples of the operating speed, which would cause a resonant condition. The design was modified to shift these frequencies, and the turbine was retested to confirm the expected changes in the modal frequencies.

15655 **A proposed method for processing data on wind energy conversion systems testing.** Borja, M.A.; Borja, R.E.; Parkman, P.A. (Instituto de Investigaciones Electricas, Apartado Postal 475, Cuernavaca, Morelos 62000). pp 333-336 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

At present, the "Method of Bins" for processing data on wind energy conversion systems testing is being used as a generalized method. But anybody working in this field has experimented the problem of overevaluation of the low part of the power curve which is evident when trying to determine system efficiency, especially in variable speed wind turbines with high hysteresis near the cut-in speed. In order to reduce this spurious problem, it was considered using the "most probable power" method previously proposed, finding that it is possible to combine both methods with their particular advantages in order to obtain a more reliable power curve. In this paper the authors present a brief discussion about the two mentioned methods, the proposed combined method, an application example for a particular system, and an activity program to determine the validity of the proposed method.

15656 **The Netherlands wind energy research and development program.** Boreel, L.J.; Hack, R.K. (Management Office for Energy Research PEO, P.O. Box 8242, 3503 RE Utrecht). pp 375-380 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

The Netherlands wind energy R&D program covers the period 1976-1990 and consists of four programmes. The first programme (1976-1981) has proven the feasibility of 1000 MW wind power for the Dutch electricity supply, and the second programme (1981-1984) resulted in the elements required for a reliable and cost-effective wind energy technology. The third programme (1985) is dedicated to programming the fourth period (1986-1990) which will concentrate on bringing together technology, industry and market in order to realize 1000 MW of wind power in the year 2000. Since 1984 wind energy R&D is managed by the Management Office for Energy Research PEO. This independent organization controls the funds allocated by the Ministry of Economic Affairs to the development of Renewable Energy in the Netherlands.

15657 **Wind speed variability in the California Altamont Pass area.** Holets, S.H. (Pacific Gas and Electric Co., 215 Market Street, San Francisco, CA). pp 411-416 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Pacific Gas and Electric Company (PG&E) measured hourly wind data at eight hilltop sites in the California Altamont Pass area during the summer of 1981. Considerable spatial and temporal variability of hourly wind speeds occurred between all eight monitoring sites with the degree of variability being a function of atmospheric stability. During early morning hours, two flow regimes often occur in the Altamont area: high wind speeds persist in the northern and central Altamont while speeds are light and variable in the southern Altamont. However, during PG&E's peak load hours (1200 to 1900 PDT), the entire Altamont area is normally in the same general flow regime. During this period, topographic influences cause average wind speed differences between sites to occasionally exceed 3.5 meters per second and speeds at hilltop sites to normally decrease with height above ground. Because wind speed variability likely occurs also in the vicinity of each of the eight monitoring sites, it is concluded that site specific speeds should neither be considered representative of widespread areas of the Altamont nor be used for estimating any detailed wind energy potentials at nearby locations.

15658 **The EEC Wind Energy R&D Programme, 1985-1988.** Rasmussen, B. (ELSAM, DK-700 Fredericia). pp 359-362 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

The paper puts the Wind Program into perspective, regarding both the total R&D Program of the EC and the previous wind programs. The situation in Europe for the market and for the research/industry is analyzed, thus giving the background and the purpose of the program.

15659 **The Italian programmes for wind energy.** Giaquinto, L.; Taschini, A.; Calovolo, M.; Montanari, P.; Rega, A.; Zappala, F. (ENEA, Rome). pp 369-374 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Started relatively late (1979-1980) and with a cautious approach, the Italian effort in the field of wind energy has slowly but continuously progressed to constitute a consolidated and realistic national program. The different public and industrial operators have contributed to create a favorable scenario for a physiologic growth of the wind energy sector: several projects and studies have been (and are being) carried out, under the sponsorship of the Ministry of Industry, by ENEA, ENEL and Industries. The projects developed, or under development in Italy, cover the whole range

of size and applications, from small systems for electrification of rural users to large WTG to be used in connection with national grids. This paper describes the role of the various operators, the various programs and the global strategy of development and exploitation of the wind energy in the framework of the national energy policy.

15660 **Wind energy technology research in the U.S.** Ancona, D.F. (U.S. Dept. of Energy). pp 387-390 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

In 1985, the U.S. Department of Energy formalized its multi-year research program plan for wind energy. The plan sets forth specific goals and objectives for wind technology development which will guide the Federal research program over the next five years. Basic research will be aimed at improving the understanding of the atmospheric physics of the wind, the wind/turbine rotor interactions, and the structural interactions of the entire wind turbine system. Results of the research will advance the technology and aid industry in designing more reliable, cost-effective wind systems.

15661 **Development of the load spectrum for the Westinghouse WWG-0600 wind turbine.** Long, R.S. (Westinghouse Electric Corp., Advanced Energy Systems Div., P.O. Box 10864, Pittsburgh, PA 15236). pp 440-445 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

One of the most challenging problems faced during the design of a large horizontal axis wind turbine is the definition of an appropriate load spectrum. This load basis must encompass steady state operating loads including the effects of turbulence and yaw error, as well as loads due to high winds, startup, shutdown, and emergency shutdown operations. Extensive analyses of the Westinghouse Wind Turbine system were performed using the REXOR II aero-elastic program. The overall model includes the effects of teetering, wind retardation, tower degrees of freedom and three blade deformation modes. These analyses provided detailed loads for the design of major components under a variety of steady state and transient operating conditions. They also provided a basis for assessing the effects of different shutdown scenarios and machine setpoints on component loads. The results of these analyses are presented.

15662 **Preliminary report on the field testing of latest model Campbell Chinese-type windmill.** Campbell, J.S.; Obendorf, D.L. (Conservation Engineering Co., Orinda, CA 94563). pp 434-439 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Since 1974, James Campbell has worked to develop a modern version of the over 2,000 years old Chinese traditional windmill. Now his latest model, a result of many step by step advances and improvements, is completely set up on the campus of Solano Community College. There, with the help of a grant from Pacific Gas and Electric Company, it is now being debugged and it will be thoroughly tested for reliability, durability and cost effectiveness. This windmill is still a research and development project. The authors principle aim is to determine, if possible, whether it can become a competitive commercial product now or possibly in the future. The paper briefly covers the windmill's principle of operation, some important design features, and some troubles recently encountered with the latest model. In addition, some previously observed advantageous features are listed.

15663 **Price targets for wind turbines in utility applications.** Goodman, F.R. (Electric Power Research Institute, Palo Alto, CA). pp 242-247 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

In late 1984, EPRI completed an assessment of the wind turbine size/price relationship. The scope of this effort covered turbines from the small, 50-kW class up to megawatt-scale wind turbines. The approach used was to design utility wind power stations using different turbine sizes. The stations were all sized for comparable overall annual energy production. The turbine price target was treated as an unknown which was to be calculated for each case studied. Each wind power station was assigned a value for energy at the station bus. Using this overall energy value target and known costs for the balance of station (i.e., the wind power station exclusive of the turbines), together with carefully selected assumptions about wind regime, station losses, wind turbine operating characteristics, and operation and maintenance costs, the residual or allowable price of the turbines (or turbine price target) was calculated for each case. Hence, a set of results emerged showing what a user can afford to pay for the turbines in a utility wind power station, as the turbine size varies. This process was repeated for several energy value targets.

15664 **Development of a maintenance free 10 KW windgenerator.** Bautz, R.A. (Panesa S.A., 2035 Corcelles). pp 423-428 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

Wind is a natural, clean, inexhaustible and independent source of energy. It's wide diffusiveness and the possibility of a direct conversion in any other form of energy makes it interesting for local uses such as water pumping, heating or electrical power supply in remote sites. PANENSA windgenerator systems are the result of long years of R & D in collaboration with the Swiss Federal Institute of Technology in Lausanne. First, a horizontal axis upwind and twin bladed machine with a permanent magnet claw type rotor was constructed. After acquiring sufficient experience on this windgenerator and to better serve the market, a new machine was developed, the WINDWATT 10 KW based on the following considerations: to use the tested technology of the 5 KW windgenerator to reduce development costs; to develop a reliable system with the least possible maintenance for remote sites; and to convert the wind energy into electricity with a maximum of efficiency by relying on specifically developed equipment.

15665 **The Taylor 'V' Type Vertical Axis Wind Turbine: Current status.** Boyle, G.A.; Robotham, A.J.; Sharp, D.J.; Taylor, D.A. (Alternative Technology Group, Open Univ., Milton Keynes, MK7 6AA). pp 429-433 of Wind power 85. Alexandria, VA; American Wind Energy Assoc. (1985). (CONF-850834—).

From WINDPOWER '85; San Francisco, CA, USA (27 Aug 1985).

The paper describes the current status of the Taylor 'V' Type Vertical Axis Wind Turbine (VAWT). The turbine which resembles the letter "V", has an inherent simplicity and a number of innovative features which could lead to an inexpensive machine, both in terms of capital and maintenance costs. An aerodynamic performance prediction model, VAWTTAY6, for this wind turbine has been developed and enhanced, and the effects of certain parameter changes on overall machine performance are compared. The results show that power coefficients in excess of 0.30 are achievable. The turbine is also self-starting even at relatively low solidities. Wind tunnel test results are presented for models with two blades, which match closely the values predicted by VAWTTAY6. Experiments on a V-VAWT model with blades which have variable pitch tips have also been carried out and their effects on performance is discussed. An experimental 8.8 metres diameter prototype is being designed and is described.

15666 **(CONF-870203—1) Simulation of geomagnetic currents induced in a power system by magnetohydrodynamic electromagnetic pulses.** Rackliffe, G.B.; Crouse, J.C.; Legro, J.R.; Kruse, V.J. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Systems Technology Div.). 1987. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87002422.

From Power Engineering Society winter meeting; New Orleans, LA, USA (1 Feb 1987).

This paper quantifies the quasi-dc currents induced on a power system by a simulated magnetohydrodynamic pulse (MHD-EMP). The determination of the quasi-dc currents is based upon the similarity between the effects of MHD-EMP and the impact of geomagnetic storms. The paper highlights how the methodology to calculate geomagnetic-induced currents from solar storms was modified to calculate the currents induced by a MHD-EMP event. After specification of the MHD-EMP environment and the selection of a power system to study, the quasi-dc currents induced in the power system were calculated.

15667 **(GEPP-TIS—366d) A bibliography and author index for electrical discharges in vacuum (1897-1984).** Miller, H.C. (General Electric Co., Largo, FL (USA). Neutron Devices Dept.). 20 Aug 1986. Contract AC04-76DP00656. 344p. NTIS, PC A15/MF A01; 1; GPO Dep. File Number DE87004165.

This bibliography covers the field of electrical discharges in vacuum, comprising both electrical breakdown in vacuum and vacuum arcs. A brief review section lists some review papers which would be helpful to the novice in this field. The bulk of the paper consists of bibliographic listings, arranged by year of publication and alphabetically by first author within each year. An author index refers one to all papers authored or coauthored by a particular person. There are 3154 papers listed through December 1984.

15668 **(ORNL/Sub—85-28611/1) Assess the impact of the steep-front, short duration impulse on electric power system insulation: Phase 1, Final report.** Burrage, L.M.; Hettwer, P.F.; Howells, E.; Veverka, E.F.; Smith, I.D.; Nelson, J.K.; Dugan, R.C. (McGraw-Edison Power Systems Div., Franksville, WI (USA). Thomas A. Edison Technical Center; Oak Ridge National Lab., TN (USA)). Feb 1987. Contract AC05-84OR21400. 114p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE87005727.

Concern has been expressed with respect to the dielectric integrity of today's power systems and power system components when subjected to steep front, short duration (SFSD) impulse. Impulses of this type are characterized by voltage rise times of 10 to 250 ns and durations to several μs. A review of the literature on SFSD impulse and its associated impact on the insulating systems used in power system apparatus was completed. SFSD impulse was found to be the result of several sources including both lightning and nuclear electromagnetic pulse (EMP) and may contribute to the so called anomalous behavior or failure of electrical apparatus. The insulation systems used in power system apparatus were ranked with respect to vulnerability to SFSD impulse. The power insulating systems believes to be at greatest risk are the porcelain/air structural insulation (line insulation) and the paper/oil/enamel systems (transformers). Events reported in the open literature as anomalous behavior or failure were cataloged and characterized. The bibliography is available as a separate report.

2001 Power Plants And Power Generation

15669 (CONF-8412124—Exc., pp 41-49) **Technical requirements on refuse-fuelled heat- and-power plants.** Vogg, H. (Kernforschungszentrum Karlsruhe G.m.b.H., Germany, F.R.). Jun 1986. (In German). NTIS (US Sales Only), PC A03. File Number DE87751306.

From Experts discussion on a waste management concept for the south western and southern Palatinate; Pirmasens, F.R. Germany (10 Dec 1984).

Abfallwirtschaft in Rheinland-Pfalz. No. 3.

A waste incineration plant must primarily fulfill the task of waste management and therefore have a high degree of safety of operation, i.e. usually have at least 7,000 service hours per year. Usually it is installed in 2, sometimes even 3 separate incineration units to ensure its permanent readiness. Another requirement of today is the utilization of its heat. Mostly a part of the heat is transferred to power, another part fed into district heating by designing the plant as a dual-purpose power plant. In addition to these 2 main tasks, recently there are increasingly severe prescriptions relating to the protection of the environment which have to be adhered to when operating a waste incineration plant.

15670 **(CONF-8503273—Summ.) Energy supply in communities and industry: Short-distance heat supply - economical and unhazardous to the environment. Documentation.** (Hessisches Ministerium fuer Wirtschaft und Technik, Wiesbaden (Germany, F.R.)). 1985. 175p. (In German). NTIS (US Sales Only), MF A01. File Number DE87751305.

From ISH '85: symposium on short-distance heat within the international trade fair sanitation-heating-air conditioning; Frankfurt am Main, F.R. Germany (22 Mar 1985).

This documentation summarizes the speeches held on a symposium which was organized in Frankfurt on 22 March 1985 on the occasion of the international trade fair 'sanitation-heating-air conditioning'. The central point is the present level of techniques and the possibilities of using cogeneration systems and combustion engine heat pumps. Requirements of profitability are discussed, as well as concepts of energy and short-distance heat supply. Finally, a reference list of cogeneration systems, numerous examples of existing systems, and operational experiences are given. (HAG).

15671 (CONF-8503273—Summ., pp 22, Paper 2) **Systems of short-distance heat supply in modular technique.** Heyne, K.G. 1985. (In German). NTIS (US Sales Only), MF A01. File Number DE87751305.

From ISH '85: symposium on short-distance heat within the international trade fair sanitation-heating-air conditioning; Frankfurt am Main, F.R. Germany (22 Mar 1985).

The author refers to dual purpose power plants consisting of modular components. After taking a critical view back to the systems of the first generation, the progressive modular technique is introduced at the examples of individual modular components. After having also taken a look at the costs, examples of modularized short-distance heat supply systems are discussed, forecasting their future chances. (HAG).

15672 (CONF-8503273—Summ., pp 10, Paper 3) **Strengths and weaknesses of cogeneration units - application of small and medium size cogeneration plants in short-distance heating systems.** Franer, F. 1985. (In German). NTIS (US Sales Only), MF A01. File Number DE87751305.

From ISH '85: symposium on short-distance heat within the international trade fair sanitation-heating-air conditioning; Frankfurt am Main, F.R. Germany (22 Mar 1985).

This article is mainly based on the comparison of strengths and weaknesses of cogeneration systems with regard to their application in short-distance heating systems. As strengths, the author counts especially their profitability, their being near to the consumers, their availability, risk diversification, and the low energy consumption. Besides the resistance on the market, hazards to the environment and various conflicts of interests and learning processes are seen as weaknesses. (HAG).

15673 (CONF-8503273—Summ., pp 6, Paper 4) **Field of application of cogeneration plants with large engines.** Taubert, G. 1985. (In German). NTIS (US Sales Only), MF A01. File Number DE87751305.

From ISH '85: symposium on short-distance heat within the international trade fair sanitation-heating-air conditioning; Frankfurt am Main, F.R. Germany (22 Mar 1985).

The author deals with the large engines being used in cogeneration systems with high performance. After a general explanation,

the decoupling of utilizable electrical energy, the relation of power and heat, the temperature level of the utilizable heat, and the fuels are discussed. Permanent operation of large engines is also dealt with briefly. (HAG).

15674 (CONF-8503273—Summ., pp 15, Paper 5) **Supply-technical, operational, and energy-political assessment of cogeneration plants.** Laistner, H. 1985. (In German). NTIS (US Sales Only), MF A01. File Number DE87751305.

From ISH '85: symposium on short-distance heat within the international trade fair sanitation-heating-air conditioning; Frankfurt am Main, F.R. Germany (22 Mar 1985).

This report deals with the objectives of an offensive local energy-policy and the possibilities of using cogeneration systems. After a brief technical description, district heating and short-distance heating, special ways of application, and the operation of the cogeneration plant are explained. Finally, the author refers to aspects of profitability, including also legal problems. (HAG).

15675 (CONF-8503273—Summ., pp 14, Paper 6) **Short-distance heat supply in Rottweil with cogeneration systems and heat pumps.** Rettich, S. 1985. (In German). NTIS (US Sales Only), MF A01. File Number DE87751305.

From ISH '85: symposium on short-distance heat within the international trade fair sanitation-heating-air conditioning; Frankfurt am Main, F.R. Germany (22 Mar 1985).

The report mainly refers to the short-distance heat supply in the city of Rottweil. In the beginning, the supply volume is shown, followed by the technical solution, and the design of the heating power plant. In addition to investigating whether to prefer heat or power, the author also deals with questions of profitability. After refering to energy savings and mineral oil substitution, the effects of the cogeneration system on the environment are discussed. (HAG).

15676 (CONF-8503273—Summ., pp 13, Paper 7) **Short-distance heat supply in the Ruelzheim recreation center by means of a cogeneration unit and heat pumps.** Jacobowsky. 1985. (In German). NTIS (US Sales Only), MF A01. File Number DE87751305.

From ISH '85: symposium on short-distance heat within the international trade fair sanitation-heating-air conditioning; Frankfurt am Main, F.R. Germany (22 Mar 1985).

This report describes at the example of the short-distance heat supply in a community the excellent possibilities which can be utilized in the planning and designing of energy supply systems. In addition to design and function of the system, the economical advantages are described. Furthermore, the planned profitability is dealt with, giving also suggestions for other possibilities of application. (HAG).

15677 (CONF-8503273—Summ., pp 24, Paper 8) **Experiences made during planning and operation of a big cogeneration unit in a municipal facility.** Wolters, H. 1985. (In German). NTIS (US Sales Only), MF A01. File Number DE87751305.

From ISH '85: symposium on short-distance heat within the international trade fair sanitation-heating-air conditioning; Frankfurt am Main, F.R. Germany (22 Mar 1985).

The author describes the cogeneration unit of Luenen, especially emphasizing the planning and operation. After a brief description of the system, the report deals with the design criteria, the call for tenders, the power and heat credits, and the optimization of energy supply. Furthermore, the maintenance contracts and insurances are discussed in addition to the operational experiences and personnel selection and assignment. (HAG).

15678 (CONF-8503273—Summ., pp 21, Paper 9) **Combination technique: Gas heat pump/cogeneration unit - tandem heating power heat pumps, energy concept of Siemens AG.** Regner, R. 1985. (In German). NTIS (US Sales Only), MF A01. File Number DE87751305.

From ISH '85: symposium on short-distance heat within the international trade fair sanitation-heating-air conditioning; Frankfurt am Main, F.R. Germany (22 Mar 1985).

The author introduces a modern energy concept which is based on the combination of a heat pump and a heating power plant. In addition to the planning, the application of modern modules is discussed. The energy concept of "heat-water-power" and its profitability are discussed. Furthermore, three tandem heating power heat pumps-producer units are discussed, pointing out their positive ecological and economical features. (HAG).

15679 (CONF-8609154—3) **The mechanism of particulate adhesion in coal-fired gas turbine systems.** Ahluwalia, R.K.; Im, K.H.; Hajduk, J.C. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004674.

From Joint PETC/METC direct utilization AR and TD contractors review meeting; Warrendale, PA, USA (22 Sep 1986).

This report presents a model for the adhesive behavior of flyash and focuses on: internal parameterization, e.g., mechanical constitutive relation; external parameterization, such as velocity, temperature, and the effect of glue. The process of deposit buildup, i.e., fouling, depends upon the fundamental interaction between particles and surface (Zimon 1982). Physically, a particle encounters a wall and elastically bounces off; or adhesive energy exceeds rebound energy and the particle sticks; or the particle adheres but later leaves the surface due to drag forces; or the particle adheres but later leaves the surface due to spallation, i.e., other incoming particles erode the surface and knock off the adhering particle. The adhesive energy arises from: Van der Waal's surface-particle attraction; and electrical attraction due to charges on the particle and surface. The presence of moisture negates the contribution of the latter of these two. The rebound energy corresponds to the incoming kinetic energy minus the energy dissipated through: capillary forces due to liquid present on the surface, i.e., glue action; and plastic deformation of either the particle or the surface (embedding). 13 refs., 5 figs., 1 tab.

15680 (DOE/MC/19281—T1) **Select use of coal and natural gas in utility boilers. A manual for evaluating environmental, technical, and legal aspects: one way to overcome foreign-oil dependency.** Price, R.T.; Shah, Y.M. (PEDCo-Environmental, Inc., Cincinnati, OH (USA)). Mar 1984. Contract AC21-82MC19281. 160p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE86004249.

The purpose of this study was to determine the environmental, technical, economic, and legal/regulatory aspects of converting non-coal-fired utility boilers to concurrent or sequential firing of coal and natural gas for presentation in this manual. Technically, the burning of coal and natural gas in a boiler is not difficult, as the two fuels are quite compatible. The consensus of utility operators who have fired the two fuels simultaneously and sequentially in the same boiler is that the natural gas enhances the coal burning, improves boiler operation and reliability, and decreases maintenance costs. Most of these boilers in which coal and gas have been fired, however, were originally designed to burn coal or were units with liberal spacing between boiler convection tubes. Nevertheless, the comments of successful users of this approach are important because of the many boilers with complete or partial coal firing capability that are currently burning oil and have done so for years. It is hoped that this manual will encourage utilities to evaluate the benefits of coal/gas firing in situations where conversion to 100% coal firing is not feasible for technical, regulatory, or economic reasons. Although ascertaining the effects of coal/gas firing in a boiler specifically designed to burn oil and/or gas requires further testing, much of the information in this manual applies to these units as well as those originally designed for coal firing. The hope is that the conversion of these units would not only reduce emissions, but also that the gas portion of the fuel would make complete revamping of these boilers unnecessary for their successful conversion to coal-fired units. It is also possible that this approach could eliminate altogether the need for expensive flue gas desulfurization equipment or greatly reduce the cost of such equipment. 12 figs., 35 tabs.

15681 (EPRI-CS—4748, pp 1.1-1.19) **Current developments in diagnostic monitoring.** Scheibel, J.R.; Armor, A.F. (Electric Power Research Institute, Palo Alto, CA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

In the next 20 years, the utility industry will be faced with maintaining the integrity of power generation and supply with only a very limited number of new plant additions. The difficulty of financing new plants, the cancellation and deferment of many nuclear orders and the uncertain rate-of-growth of the industry, places increasing emphasis on the availability of the existing generation. In particular, many fossil units are approaching the limit of their design lives (typically 30-40 years) and present a challenge to utilities in extending life without impacting availability. It is in this current climate that the techniques of incipient failure detection are beginning to flourish. Early warning of component deterioration is seen as an essential part of any predictive maintenance program for fossil plants. Conversely, the absence of such techniques leads to sudden, and often catastrophic, equipment failure implying extended outages for repair and replacement. When faced with only one day additional downtime on a large unit, the capital cost of monitoring equipment is quickly exceeded so these monitors are viable devices for all utilities to consider. Turbine shaft, disc, or blade failures can be catastrophic, the result being major turbine-generator damage, long outage time and possible safety implications for plant personnel. 13 references, 13 figures.

15682 (EPRI-CS—4748, pp 1.19-1.31) **Periodic vibration monitoring at Georgia Power Company.** Fearing, H.A. (Southern Co. Services, Inc., Birmingham, AL). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

For many years, the Research and Development (R & D) Department of Southern Company Services, Inc., has used vibration analysis to diagnose machine problems at the generating plants of Alabama Power Company, Georgia Power Company, Gulf Power Company, and Mississippi Power Company. It is believed that vibration analysis also shows promise as a preventive maintenance tool that could reduce the number of machine failures and thereby increase plant availability. However, the R & D Department had no experience monitoring machine vibrations for preventive maintenance, and little information was available about the costs and benefits of such a program. Therefore, with the cooperation of Georgia Power Company, R & D initiated a pilot vibration monitoring program at Plant Bowen. The goals of this program are: (1) to determine whether a vibration monitoring program could successfully prevent machine failures; (2) to gain first-hand experience in the installation and operation of a vibration monitoring program at a power plant; and (3) to determine the costs and benefits of various monitoring strategies. With the experience from this program, R & D will have a measure of the effectiveness of vibration monitoring as a preventive maintenance tool. The evidence will be presented to systems plants, and R & D will provide expertise and support to plants interested in starting their own programs. 5 figures, 1 table.

15683 (EPRI-CS—4748, pp 1.33-1.56) **Benefits of switching from a manual to computerized vibration predictive maintenance system.** Catlin, J.B. Jr. (IRD Mechanalysis, Inc., Columbus, OH). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

Vibration predictive maintenance started, perhaps, 30 years ago with portable instruments designed primarily to detect unbalance in machinery. Over the years, however, it was found that other defects such as misalignment, losseness and defective rolling element bearings could also be detected. As these predictive maintenance programs have become more valuable to industry in terms of increased machinery life, reduced machinery downtime, improved productivity, and reduced maintenance costs, they tended to expand in size, often including hundreds and even thousands of machines. Along with the increased effectiveness of these programs has come increased complexity: wider variety of measurement parameters, wider frequency ranges, more precision in measurement, and many more measurements to record and analyze. The net result has been a need for a substantial increase in manpower. As an alternate to increased manpower many industries have searched for ways to automate their programs. Until recently, automation has been limited to the use of automatic permanently installed monitor systems. Now, however, computer based systems have been developed which operate in a manner similar to manual periodic check programs which use portable instruments. The performance of these computer-based systems is discussed.

15684 (EPRI-CS—4748, pp 1.57-1.63) **Evaluation of alternative techniques for machinery vibration monitoring.** Shugars, H.G.; Moore, T.I. (Electric Power Research Institute, Palo Alto, CA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

Electric utilities have for many years monitored equipment vibration to detect machinery failures. The approaches for monitoring machines has varied widely, from computer aided continuous monitoring to periodic hand held monitoring. EPRI has initiated a project to evaluate various machinery monitoring approaches and demonstrate the benefits, costs, and lessons learned from a planned machinery monitoring approach. The project will be completed through the development of a Utility Machinery Monitoring Guide that will address all aspects of planning and implementing a plant machinery monitoring program. This paper describes the Utility Machinery Monitoring Guide and how it will be developed. 1 table.

15685 (EPRI-CS—4748, pp 1.85-1.104) **San Diego Gas & Electric's vibration monitoring/reduction program.** Curran, R.P.; Diggs, R.S.; Linney, E.O.; Reguly, T.M.; Walker, L.E. (San Diego Gas & Electric Co., CA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

The San Diego Gas & Electric Company's (SDG & E's) vibration monitoring program was started in 1971. Hand-held vibration meters were used to take vibration readings on equipment that already had problems. This type of monitoring continued until 1978 when a formal program was established to monitor plant machinery on a regular basis. SDG & E's present vibration program consists of three basic parts: monitoring, diagnostics, and balancing. The intent of the program is to reduce the number of mechanical equipment failures by early detection. This allows maintenance personnel the opportunity to schedule maintenance when they want to, and not when they have to. In addition, an attempt is made to operate the equipment at the lowest vibration level than can be cost-effectively achieved. The SDG & E's vibration monitoring reduction program is described. 9 figures.

15686 (EPRI-CS—4748, pp 1.105-1.122) **Start-up support and trouble shooting for multi-bearing machine.** Bowman, R.M.J. Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

Practice has shown that the rotor bearing system may substantially influence running behavior of a machine. Not only do the bearings transfer the rotor-induced vibrations, they can also cause instability themselves. The running behavior of a machine has been evaluated mainly with the aid of frequency spectra obtained by means of vibration velocities are measured with the aid of a speed-sensitive pick-up, or relative displacements between shaft and bearing casing are established with an inductive pick-up. For optimum start-up support or in case of established bearing trouble, it is well-advised to conduct not only a dynamic measurement, but a static measurement as well and to process the test readings skillfully. Only this procedure permits plan indication of any anticipated or established difficulties. The procedure followed for start-up of a multi-bearing machine is described.

15687 (EPRI-CS—4748, pp 2.1-2.30) **Detection of incipient failure in vertical pumps.** Walter, T.J.; Shugars, H.G.; Wood, J.W. (Shaker Research Corp., Latham, NY). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

This paper summarizes the planned scope of work and results to date of EPRI project RP2338-1, On-Line Monitoring and Diagnostics for Submerged Vertical Shaft Pumps. Also described are several experimental efforts that reinforce the need to accomplish the project goal, that of extending to vertical pumps the capability that now exists to monitor and diagnose problems with horizontal pumps. The project is based on iterative analytical and experimental efforts and is being implemented on three different types of vertical pumps typically found in power plants. Vertical pumps often operate for extended periods with vibration levels and signs of unstable operation that normally dictate immediate shutdown in most machinery. These conditions are often detected during off-normal operation by sensors mounted within the submerged portion of the pump. 13 figures.

15688 (EPRI-CS—4748, pp 2.31-2.50) **Diagnostic monitoring of axial flow fan bearings.** Tuten, J.M.; Kaiser, W.D.; Scheibel, J. (Battelle Columbus Labs., Columbus, OH). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

This paper presents the results to date on an EPRI sponsored project to demonstrate the practicality of using bearing monitoring techniques to predict impending failures of rolling element bearings. Current methods and technology were reviewed and a monitoring methodology was selected and implemented on a number of in-service axial flow fan bearings. These bearings have been monitored for a period of 14 months during which time two bearings were removed from service due to indicated failure. Preliminary analysis of these bearings and correlation of the bearing condition with the monitoring system output are presented. 24 references, 11 figures.

15689 (EPRI-CS—4748, pp 2.51-2.70) **Detection of turbomachine blading problems using on and off-line monitoring.** Boyce, M.P.; Meher-Homji, C.B.; Focke, A.B.; Bowman, J.C. (Boyce Engineering International, Inc., Houston, TX). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

This paper deals with on-line and off-line techniques to detect blade problems before they get to a failure mode. This is achieved by the use of spectrum analysis combined with aerodynamic blade loading analysis. These techniques can result in predictions which save major failures. This paper also discusses the complexities of blading problems for axial and centrifugal compressors and turbines. A case of surge related problems is discussed. A detailed case history of detection of a blading problem on a large single stage, axial flow expander using Fast Fourier Transform (FFT) vibration techniques is presented in detail. 9 references, 9 figures.

15690 (EPRI-CS—4748, pp 2.73-2.94) **Vibration signature analysis at Philadelphia Electric.** Frarey, J.L.; Scheibel, J. (Shaker Research Corp., Latham, NY). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

Monitoring systems for rotating machinery are becoming widely accepted in industry, because their value has been proven in avoiding catastrophic failure. Most of these systems rely heavily on the judgement and experience of well-trained professional vibration analysts. The vibration analyst is the link that is needed between symptoms suggested by a relatively large amount of acquired data and a recommended course of action. In a current EPRI contract, RP 1864-1, Shaker Research Corporation (SRC) undertook the development of a computer-based machinery monitoring and diagnostic system that seeks to incorporate many of the analysis techniques that until recently involved labor-intensive skills possessed by a handful of experts. The intent of this particular program is to replace the vibration analyst up to the point where a cause-and-effect relationship can be established. That is, the human element would not be needed until after all the necessary data had been acquired, the unessential data filtered out - leaving only the significant data for processing, and these data reduced to create the major elements of a symptom-fault matrix. The focus of this work is to ensure that the kind of data needed for analysis is present in the system and that meaningful diagnostic decisions can be made based on the proper interpretation of the data. Once these parallel goals have been satisfied, automation of the decision-making process (i.e., the isolation of the fault) is a relatively straightforward task. 8 figures, 3 tables.

(United Illuminating Co., New Haven, CT). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

An automated system for on-line vibration monitoring of critical machinery in a power plant is described. The system is based on a minicomputer which acquires, processes and stores data from vibration sensors and from other sensors which measure machinery operating conditions. This system is the key element in a predictive maintenance program to increase plant availability through early detection, diagnosis and management of progressive failures in rotating machinery. Data are displayed on a high resolution color CRT under operator control. Display formats for machinery fault detection and diagnosis include vibration time series, spectra and orbits for current data; historical vibration and plant parameters may also be displayed for trend analysis. Other displays show current machine status and vibration levels in an easy-to-read format. During startups and rolldowns, vibration levels are displayed in real time along with data from previous startups or rolldowns for comparison. Historical and reference data are maintained on-line for quick access. Operator controlled functions are accessed through a simple menu structure so the system can be used by plant personnel with a minimum of training. This system has been in operation at United Illuminating Company's New Haven Harbor Station for more than one year. use of the system in the plant maintenance program is described. 11 figures.

As the Power Generation Industry undergoes dramatic operational changes due to increased regulatory pressures and public opinion, renewed emphasis has been placed on the benefits and savings provided by Machinery Condition Monitoring. This paper describes the dramatic physical changes a large steam turbine undergoes while operating from turning gear to full load operations. Also discussed are the various machinery parameters, techniques and instruments currently being used to measure these changes, as well as a basic description of what these measurements mean. 10 figures.

(Westinghouse Electric Corp., Pittsburgh, PA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

This paper describes efforts to develop an unmanned commercial water induction detection system suitable for providing adequate warning of impending water induction incidents in steam turbines. The field testing was primarily aimed at the protection of

low pressure turbines from water backups from feedwater heaters, however, most of the work also has application to higher pressure and temperature parts of the steam cycle. The monitoring system included active ultrasonics, newly developed fast thermocouples, and two electronic level gauge sensors. The sensor outputs are conditioned and presented to a minicomputer which records and analyzes the signals from the various systems and provides warnings of impending water events. The system was installed and operated over several months on the extraction lines of a low pressure feedwater heater at the Pennsylvania Electric Company's Homer City Generating Station. With rigorous attention to turbine protection, controlled water incidents were carried out under representative flow and thermodynamic conditions during normal operation of the power plant. Signatures from these controlled incidents were recorded, analyzed, and used to develop computer algorithms for unmanned monitoring. The system was then successfully tested in the operating power plant with additional controlled water incidents. During several months of unmanned monitoring the system detected and recorded two unexpected water incidents, thus providing valuable system responses under actual field conditions. Based upon this work, general specifications for a commercial configuration of a water induction detection system have been developed. 8 references, 10 figures.

15694 (EPRI-CS—4748, pp 3.19-3.30) **Monitoring of steam turbine environments for detection of stress corrosion cracking.** Chung, P.; Gayley, H. (Taiwan Industrial Technology Research Institute). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

Stress corrosion cracking (SCC) has been a problem of considerable concern for many years as evidenced by many published reports. These references provide extensive further information on the experience gained world-wide concerning the stress corrosion cracking of steam turbine rotors. The studies in these references have examined the important of operating stresses, materials and environment on the SCC of turbine rotors. As a result of this work, actions have been taken to minimize cracking in current and future turbine rotors, but methods for complete protection from cracking have not been evolved. Based on this, detection of cracking and conditions which may lead to cracking, are of continuing importance. This paper describes equipment and test results which may contribute to early detection of steam turbine rotor SCC or the conditions leading to cracking. This work was sponsored by the Electric Power Research Institute. 8 references, 9 figures.

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

Cracking of rotors in large steam turbines can be a significant problem for electric utilities because an undetected rotor crack may lead to major extended outage. An on-line rotor crack detection and monitoring system to detect and evaluate cracks in steam turbine rotors at an early stage, while the machine is operating under load, is being developed at General Electric under an EPRI contract. Both experimental and analytical approaches are being combined to develop this diagnostic system. The major tasks of the four-year project include the development of an analytical nonlinear rotor dynamics crack model and advanced signature analysis techniques, the development of a microprocessor-based multichannel on-line rotor crack detection monitoring system, and the performance of large-scale laboratory and field tests. This paper summarizes the activities of the first year and a half of the program. These activities include development and experimental validation of a 3-D finite-element rotor crack model, performance of the first large-scale laboratory tests, and development of a first-generation on-line rotor crack detection and monitoring system. A significant accomplishment was the successful detection of a fatigue crack in an on-line mode. The crack depth was 1% to 3% of the rotor diameter. The results of the first large-scale laboratory tests are discussed. Plans for the development of the prototype rotor crack detection system are outlined. 12 references, 19 figures.

(Westinghouse Electric Corp., Orlando, FL). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

An Artificial Intelligence (AI) based, on-line Turbine Generator diagnostic expert system which is presently under development is described. Utilizing the inputs from a number of sensors, the diagnostic system evaluates the condition of the equipment and communicates appropriate action. This is an improvement over present monitoring systems which simply apply alarm limits to the value of each sensed variable. In comparison, a diagnostic system identifies equipment and instrument problems earlier with a higher degree of accuracy. 7 references, 2 figures.

15697 (EPRI-CS—4748, pp 3.69-3.78) **Mechanitrack system.** Cleveland, W.E.; Bowman, D.W. (Precision Mechanical Analysis, Inc., Brandon, FL). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

There are four primary ways one can approach the problem or maintaining rotating equipment: (1) operate it until it fails, then repair it at that time; (2) perform periodic inspections and lubrication changes to help avert on-line failures; (3) monitor machinery overall vibration levels and perform investigative maintenance; and (4) perform minimum maintenance and lubrication changes, but precisely when needed through advanced detection and scheduling. The fourth alternative, usually referred to an predictive maintenance would seem to be the only logical choice of every maintenance and operations supervisor. The state of the arts analytical equipment, computer programming, and consulting expertise have been coupled in order to establish the most modern and complete predictive maintenance program possible. In order to establish and implement a complete predictive maintenance program it must utilize four synergistic aspects: (1) real time vibration spectrum analysis; (2) lubrication degradation analysis; (direct reading emission spectrometry); (3) bearing temperature analysis; and (4) inspection schedule aspect. All four aspects need to be computerized for ease of data manipulation and review. The most critical areas incorporated in the mechanitrack program are reviewed.

(Rockwell International Science Center, Thousand Oaks, CA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

Experience over several years with on-line monitoring of steam turbines, supported by relevant laboratory studies, has led to a clearer understanding of the conditions under which acoustic emission (AE) due to turbine shaft cracking can be detected. For optimum detection of AE due to crack growth, the transducers should be placed as close to the location of the cracking and as far from extraneous noise sources as possible. For turbine shafts, this location is inside the rotor bore hole. However, problems in maintaining long-term stability of the transducers in this high temperature environment and with reliability in getting power and the electrical signals to and from the transducers would require a considerable development effort. Instead, in this program, the AE monitoring transducers have been located on the outside of the turbine shaft near its ends. To overcome problems associated with this noisier environment, efforts have been directed at improving the AE signal discrimination capabilities of the monitoring electronics. These efforts have been guided by extensive measurements of the amplitude, frequency and time dependence of normal turbine noises in a variety of operating conditions. Similar measurements have

been made in the laboratory to determine the characteristics of AE due to crack growth in rotor steels with several loading conditions and temperatures. These measurements, along with determinations of the attenuation and wave propagation characteristics of simulated AE in the rotor shafts, have permitted estimates of the detectability of AE due to crack growth under various conditions, should it occur. All of the development efforts have now been completed for initiating long-term monitoring to detect crack growth.

15699 (EPRI-CS—4748, pp 4.23-4.53) **Acoustic leak detection in fossil fueled boilers.** Snow, D.J.; Ball, P.A. (CEGB, Nottingham, England). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

Acoustic leak detection systems were first installed in the CEGB power stations over a decade ago as experimental early warning devices. In the ensuing years the instrument has developed into a prove commercially available device fitted to 67 fossil-fuelled boilers in the UK. Eight boiler systems are operational in Scotland and initial installations are being commissioned elsewhere in Europe and other continents. This paper describes the development of the instrument into its present form, its positioning in the boiler and its method of operation. The key features and latest developments used to achieve extended reliability throughout the boiler are given. The paper goes on to describe the ability of the equipment to detect boiler leaks at an early stage using as examples the records of leaks occurring in different parts of the boiler. Also mentioned are associated benefits not originally envisaged such as early warning of sootblower malfunction and mechanical failure. Finally, the most recent developments including the choice of information display and the prospects for more refined leak location are discussed. 8 references, 17 figures, 2 tables.

15700 (EPRI-CS—4748, pp 4.55-4.78) **Leak detection by acoustic emission monitoring in power plant high pressure preheaters.** Famiglietti, M.; Scandolo, D.; Tonolini, F.; Ghia, S.; Regis, V. (CISE Spa, Milan, Italy). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

The paper presents an acoustic monitoring technique for leak detection in feedwater HP preheaters. The leak detection is based on the ultrasonic noise produced by the turbulent leak outflow and transmitted by the metal of the component. The sensors are piezoelectric acoustic emission transducers, installed on the outer side of the shell of preheaters. The sensitivity of the instrumental system is satisfactory. The main results obtained in about three years of experimental activity both in laboratory and in power plants showed excellent reliability and performances of the AE leak detection monitoring system. The equipment is now under qualification tests in power station. 19 references, 12 figures, 1 table.

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

A leak in any system is in some way detrimental to its operation. In nuclear power plants, a single leak of a sufficient size can force the entire plant to shut down. A leak in a recovery boiler, which is used extensively in the paper industry, can lead to a smelt-water explosion which damages the boiler and jeopardizes the safety of the operators. While a leak in a fossil-fired power plant does not cause such disastrous results, significant expenses can be incurred with leaks. Tube leaks in power plant boilers are frequent failures and are responsible for more forced outages in power plants than any other single cause. The cost to the utility industry is in excess of $500 million a year for replacement power charges and maintenance cost. Leaks may be controllable to some degree, but they are unavoidable and will continue to occur. Although leaks cannot be prevented, early detection of leaks can allow operators to schedule repair work to lessen the impact on production costs and down time. For this reason, efforts have been directed to develop leak detection systems for boilers. Two approaches which have been receiving much attention and evaluation are acoustic and acoustic emission (AE) methods. Both approaches monitor continuous random vibrations produced by the leak. In the acoustic system, the gas-borne sound, which is produced primarily by the eddies in the steam jet issuing from the leak is monitored. Acoustic emission monitoring involves detecting the structure-borne mechanical vibration also produced by the presence of the leak. The basis of each detection approach is discussed and some recent studies involving AE leak detection systems are reviewed. 19 references, 8 figures, 4 tables.

15702 (EPRI-CS—4748, pp 4.109-4.126) **On-line boiler stress and condition analyzer.** Davidson, M.J.; Jones, T.J. Jr.; Siddall, W.F.; Rosard, D.D.; Scheibel, J.R. (Combustion Engineering, Inc., Windsor, CT). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

Combustion Engineering is under contract to EPRI to develop, construct and implement into a utility boiler a prototype on-line Boiler Stress and Condition Analyzer. The objective of the program is to develop and to demonstrate the analyzer's potential to optimize the life of critical boiler components. The analyzer has been designed to assist the operator to warn of damaging transients, to optimize boiler start-up/shutdown rates and to accumulate unit operation data to calculate component life expenditure. The analyzer has been installed at the Consolidated Edison Ravenswood #30 unit, a 1000 MW oil fired unit. This paper will outline the overall program and highlight significant results to date. 4 figures, 1 table.

15703 (EPRI-CS—4748, pp 4.127-4.133) **Initial feasibility study of halogen tracer method for finding boiler tube leaks.** Pelletier, C.A. (Science Applications, Inc., Rockville, MD). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

A feasibility study involving the detection of boiler tube leaks when they are very small is described. The study will assess the feasibility of fossil fueled power plants detecting small leaks in boiler tubes by releasing a gaseous tracer into the feedwater and analyzing the flue gas for the tracer. The plans and expectations for the program. 2 references, 2 figures are discussed.

15704 (EPRI-CS—4748, pp 5.35-5.59) **New approach for diagnostic monitoring of wear, erosion and corrosion in utility applications.** Sioshansi, P.; Blatchley, C.C.; Scheibel, J.R.; Duncan, D.; Fishburn, J. (Spire Corp., Bedford, MA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

Surface layer activation (SLA) is an extremely precise and reliable method for in situ monitoring of material loss due to wear, erosion or corrosion. Progress is reported on two projects which were designed by EPRI and Spire Corporation to investigate the feasibility of applying the SLA technique in utility power generating plants. In one program a Spire/General Electric team is applying the SLA method to monitor the solid particle erosion of a stop valve bypass valve. In the other program a Spire/Combustion Engineering team is evaluating the SLA method as it applies to the study of bearing wear in boiler circulation pumps. While these two projects are aimed at preventing component failure or avoiding unnecessary preventive maintenance, the technique can also be applied as a diagnostic tool combined with a station performance monitoring system. Examples of possible diagnostic applications include: (1) correlating wear in first stage nozzles and buckets with efficiency loss, (2) evaluating methods for reducing solid particle erosion such as boiler chromating or resistant coatings on parts, (3) developing and evaluating new materials and designs to reduce erosion rates, and (4) evaluating and optimizing operating procedures. 13 references, 7 figures, 5 tables.

15705 (EPRI-CS—4748, pp 5.61-5.99) **Laser doppler measurement of torsional vibrations.** Mannava, S.R.; Scheibel, J.R.; Armor, A.F. (General Electric Co., Schenectady, NY). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

A non-contacting laser Doppler instrument is being developed at the General Electric Company under the sponsorship of Electric Power Research Institute (EPRI) to measure vibrations from a wide variety of power plant equipment with a minimal effect on normal plant operations. Ultimately, it should also be useful for applications requiring both short- and long-term diagnostic monitoring. A summary of results from laboratory experiments and subsequent factory testing is presented in this report. Discussed is the program carried out to demonstrate the feasibility of applying the laser Doppler technique to measure the torsional vibrations of rotating shafts. Several laboratory experiments were conducted to evaluate the performance characteristics under simulated operating conditions. This phase of feasibility was followed by a factory test on a production generator in the balance bunker facility of the General Electric Company, Schenectady, New York, to further verify the performance of laser Doppler concept. With the successful completion of the factory test, a significant milestone has been reached in the demonstration of the laser doppler technique to measure torsional vibrations in rotating shafts. Based on this development, a commercial device can be designed and packaged to measure torsional vibrations in a power plant environment. Briefly mentioned will be the current phase of the program to extend the laser Doppler technique to the measurement of linear vibrations. 20 references, 16 figures.

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

The nondestructive testing methods of surface and subsurface regions to a depth of 0.050 inches (0.125 cm) in use at this time are visual inspection, liquid penetrant, magnetic particle, and eddy current (1). In this paper they describe the basis and initial results of work sponsored by the Electric Power Research Institute of Palo Alto, California, on investigation of another technique that will detect surface and subsurface imperfections. This technique, which is physically non-contacting, depends on the discovery of flaws such as surface cracks by monitoring of the thermal radiation emitted from the surfaces. Two difference methods of revealing a crack have been under investigation. In the first of these the surface is heated selectively and surface irregularities are revealed because they affect the heat transfer characteristics. In the second, which requires no heating, cracks are found because the emissivity of the region of a crack differs from that of the rest of the surface. They will concentrate first on the method requiring surface heating, which is applicable to finding both cracks and subsurface imperfections. This is followed by the second method, which is expected to be applicable to finding surface cracks as they might develop on a rapidly rotating shaft, while the shaft is in rotation. 17 references, 15 figures.

15708 (EPRI-CS—4748, pp 5.163-5.183) **Update on an acoustic doppler technique for detecting resonant turbine blades.** Leon, R. (Liberty Technology Center, Inc., Conshohocken, PA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

The Franklin Research Center, and Liberty Technology Center, under EPRI project RP 1854, have been carrying out a test program to verify an acoustic Doppler technique which can be used for locating resonant turbine blades in operation. In this technique, a single sensor located in the casing slightly downstream of the monitored blade row is used to sense the acoustic energy radiating from the vibrating blade. Signal processing procedures, including synchronous averaging, selective blanking and envelope detection are used to uncover this small but highly characteristic waveform from the much larger background noise in the turbine. In the already completed Phase 1 portion of the program, the sensor to be used was selected, the expected Doppler effect was demonstrated, the synchronous averaging procedure was shown to be effective in removing the random flow noise, and using computer simulations a Hilbert transform approach was shown to be far more accurate for localizing multi-blade low-order vibrations than the original envelope detection method. The Phase 2 portion of the program is presently underway on a scaled down L-1 stage of a Westinghouse research turbine. Results to date have shown the selected sensors to be effective and exceptionally reliable. However, blade dimensional variations have resulted in an order-related flow wake pattern that presents unexpected demands on the technique. Two means of dealing with this new problem are being tested. One involves the use of two closely positioned sensors, and the other involves taking advantage of ultra slight speed changes of the turbine. On the plus side, this sensitivity to small dimensional variations might be used to detect such things as shroud section lifting, and this is being explored within the program as well. 10 figures.

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

Scale and deposits in turbines of electric utility plants cause a loss of efficiency whose cost is estimated in this paper. The major causes are listed for forced full and partial outages for the period 1971-80 for fossil fuel and nuclear power plants. The estimated cost of replacement and outage length are given for failures in major pieces of equipment in power plants. 6 references, 3 figures, 4 tables.

15710 (EPRI-CS—4950, pp 2.1-2.19) **Babcock & Wilcox Company water chemistry guidelines for once-through steam generators and drum boilers.** Pocock, F.J. (Babcock & Wilcox Co., Alliance, OH). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

Test facilities and research programs are reviewed which were carried out by Babcock and Wilson Company on water quality requirements for once-through steam generators and drum boilers. Guidelines are given for water quality for drum-type boilers operating at 2000 psig or higher for base-loaded power operation and for cycling service. Further research needed for improving water quality control for cycling operations is listed. 42 references, 12 figures, 4 tables.

15711 (EPRI-CS—4950, pp 3.1-3.18) **Recommended water chemistry practices for high pressure-drum type boilers.** Goodstine, S.L. (Combustion Engineering Inc., Windsor, CT). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

Electric utilities in the United States are placing increasing emphasis on extending the life of their fossil fueled boilers. Many are undertaking Life Extension Studies to determine the necessary maintenance needed to continue operation of older units another 10 or more years. Examination of tube samples taken from units as part of these Life Extension Studies and samples submitted for failure analysis show that internal corrosion and deposition continue to be problem areas. This paper reviews the water chemistry practices recommended by Combustion Engineering for high pressure drum-type utility boilers. Requirements for water chemistry control are based on the need to mitigate the effects of: oxygen corrosion, deposition, and contaminant inleakage. All phases of operation, including standby, startup, and operation are discussed. Additional recommendations for units in cycling duty are also covered. 5 references, 4 figures, 6 tables.

15712 (EPRI-CS—4950, pp 4.1-4.22) **Factors affecting boiler water chemistry.** Amoruso, G.V. (Foster Wheeler Development Corp., Livingston, NJ). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

The control of boiler water purity in power plants is of vital concern to power plant operators because of its crucial impact upon power plant operation, efficiency, and structural integrity of critical components. This paper deals with a contractor's rationale for boiler feedwater purity, some factors affecting boiler water chemistry, and the ramifications of boiler water impurities on structural steel components in power plants. 5 references, 11 figures, 2 tables.

15713 (EPRI-CS—4950, pp 5.1-5.15) **Steam turbine chemistry - a review.** Gould, G.C. (General Electric, Schenectady, NY). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

The turbine acts as a fractional distillation tower concentrating impurities in steam to levels where, as aqueous solutions, they can cause serious problems of fouling or corrosion. The thermodynamic properties of the steam water and impurities are such that the concentrating mechanisms will proceed and deposition problems will occur if the vapor phase concentration of impurities exceed I ppb. Recent experiments show that some relief from the dire predictions of thermodynamics is gained at low concentrations of impurities by the fact that the rate of condensation is apparently too slow at very dilute steam solutions to condensate the concentrated solutions. Concentration of impurities was observed when the level of impurities was in the 5-10 ppb range. Due to the wide variety of potential deposits, and the fact that turbine materials need to have many properties in addition to corrosion resistance, it seems unlikely that a corrosion resistant turbine is realistic solution to the problem of turbine deposits. The primary control of turbine deposits and the concomitant problems of fouling, corrosion and corrosion fatigue still lies in the careful control of impurity levels in the steam. This in turn requires careful control of the water conditioning and treatment procedures. 27 references, 4 figures.

15714 (EPRI-CS—4950, pp 6.1-6.15) **Steam purity recommendations - the Westinghouse experience.** Bellows, J.C. (Westinghouse Electric Corp., Orlando, FL). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

The Westinghouse Steam Purity Recommendations are presented and the rationale for their formulation is discussed. Tentative revisions are given. An extensive monitoring program has shown the recommendations to be measurable and achievable. The chemical control strategy of never exceeding normal operation limits has led to the development of a chemical artificial intelligence diagnostic system to aid in determining the cause of power plant chemistry upsets. Comments on the opportunities and pitfalls of a system approach to chemistry guidelines are made. 11 references, 5 figures, 1 table.

15715 (EPRI-CS—4950, pp 7.1-7.20) **Impact of feedwater chemistry on feedwater heater tubes.** Impagliazzo, A.M.; Bell, R.J.; Conley, E.F. (Heat Transfer Consultants, Hingham, MA). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

Although corrosion is well defined as a generic feedwater heater problem, no single document has been published which provides sufficient information to enable utility engineers to understand the complex materials/environmental interplay that is involved in feedwater heater corrosion. Perhaps what has been the most elusive of all necessary information is a practical guideline which provides definition of feedwater heater susceptibility to corrosion by material, actual environment, and component location within a specific feedwater heater design. Actual environment alludes to the fact that, although, the bulk feedwater composition is high purity, from a corrosion perspective the composition of the feedwater which is immediately adjacent to the locally corroding metal surface is the only water chemistry of significant concern. In other words, feedwater contaminant concentrating factors must be addressed. Some of these factors are feedwater evaporation and contaminant recrystallization on another surface, deposition of entrained contaminants through flashing or contaminant concentration through electrostatic attraction at locally corroding sites. Similarly, the sources of such contaminants must be identified. This paper concentrates on the effect of the feedwater heater environment upon various tube materials. Copper alloys, Monel-400, carbon steel, 304 stainless, and ferritic stainless steels are the materials of interest in this study. 4 references.

15716 (EPRI-CS—4950, pp 8.1-8.13) **Deaerators - design and operation, effect on water chemistry, corrosion problems.** Jonas, O. (Jonas, Inc., Wilmington, DE). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

Deaerators (direct contact deaerating heaters) are used in fossil and some nuclear power plants to remove dissolved gases (mostly oxygen and nitrogen) by mechanical deaeration and to provide water storage capacity to give a residence time at appropriate elevated temperatures for chemical oxygen scavenging to take place. In addition, deaerator storage capacity and hydrostatic head provide flow conditions for the boiler feed pump. A typical location of a deaerator in a drum boiler and once-through fossil cycle is between the low pressure and high pressure feedwater heaters before the boiler feed pump. Most deaerator vessels are fabricated from carbon steel. This paper discusses deaeration and oxygen scavenging mechanisms, corrosion problems and protection, research programs, and emerging options which may replace the oxygen removal function of deaerators. 12 references, 11 figures.

15717 (EPRI-CS—4950, pp 9.1-9.32) **Condenser performance improvements.** Colt, R.L. Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

Laboratory testing and field experience provide persuasive evidence that a high percentage of failures in boilers/steam generators and low-pressure steam turbines are corrosion induced, and that leakage of air and cooling water into the condenser plays a critical role in the mechanisms of these failures. If one concurs with this assessment, the actions that should be taken to minimize the problem include at least the following: (1) ensure essentially zero inleakage of cooling water over the expected life of the plant by selecting corrosion-resistant materials and providing adequate maintenance; (2) minimize air inleakage; (3) provide for improved condenser deaeration at low loads. 21 references, 34 figures.

15718 (EPRI-CS—4950, pp 10.1-10.47) **Transport of chemicals in steam cycles.** Jonas, O. (Jonas, Inc., Wilmington, DE). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

Transport of impurities and water treatment chemicals in steam cycles is described. Chemical species found in water, steam, and deposits are identified, their major sources and removal processes discussed, and effects of cycle design, material selection, steady and transient operation, and water chemistry described. Typical data are given to illustrate that the knowledge of chemical transport is important for the control of scale and corrosion. Such control is successful when the relationships between the measured average bulk concentrations in cycle streams and the localized concentration and corrosion processes on surfaces of cycle components are understood. 64 references, 21 figures, 9 tables.

15719 (EPRI-CS—4950, pp 11.1-11.8) **EEI chemistry committee perspective - current US utility practices.** Blood, F.X. (Union Electric, St. Louis, MO). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

The organization, membership, and technical scope of the EEI Chemistry Committee are described. The technical scope includes all corporate chemistry-related functions, with emphasis directed toward the engineering, operation, and maintenance of fossil and nuclear power plants and electrical apparatus. A listing is given of the subjects of reports which relate to aspects of water chemistry submitted at the meetings held during the last two years. The combined knowledge and experience of EEI Chemistry Committee members is a great resource to call upon in the resolution of problems.

15720 (EPRI-CS—4950, pp 12.1-12.22) **Overview of RP2712-1, interim consensus guidelines on fossil plant cycle chemistry.** Aschoff, A.F.; Sopocy, D.M.; Dooley, R.B.; Coit, R.L. (Sargent & Lundy, Chicago, IL). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

In an effort to establish some degree of standardization in the fossil industry comparable to that now available in the nuclear industry, EPRI has originated a research program, RP2712, to address the various problems related to water chemistry, forced outages, and corrosion and deposit control. The first three phases of RP2712 consist of: RP2712-1, Generation of Interim Consensus Guidelines on Fossil Plant Cycle Chemistry; RP2712-2, Instrumentation and Control for Fossil Plant Cycle Chemistry; and RP2712-3, Monitoring Cycle Water Chemistry in Fossil-Fired Plant. RP2712-1 was recently awarded to Sargent & Lundy and work was begun on April 25, 1985. This paper is devoted to a discussion of the scope of work and progress of RP2712-1.

15721 (EPRI-CS—4950, pp 13.1-13.17) **TUGCO's turbine environment index.** Wadlington, M. (Texas Utilities Generating Co., Dallas, TX). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

In the spring of 1979 TUGCO began experiencing corrosion assisted failures of low pressure turbine blades at two of the lignite-fired plants, Big Brown and Monticello. Eventually similar failures occurred at the Martin Lake Station. Deposition, pitting, and cracking characterized all of our blade failures. The deposits were predominantly silica and iron oxide but smaller amounts of sodium and occasionally chloride were found. A major effort and emphasis was placed on improving the low pressure turbine environment. Corrective actions included: tighter water/steam quality parameters; improved condensate log sheet; implemented condensate log sheet; implemented start-up log sheet; added state of the art sodium and chloride analyzers; conducted steam purity seminars; utilized portable water quality monitors for sampling low pressure steam, heater drains, individual polishing demineralizer vessels, etc.; added ion chromatography instrumentation and routine grab-sample analyses; TOC analyses; U-bend corrosion specimens in the L.P. Turbine; condensate polisher performance testing; hydrazine injection into the lower pressure turbine inlet (crossover) on 7 units; and turbine environment index. The Turbine Environment Index (TEI) is defined as the air leakage (in SCFM) time 0.10 plus the cation conductivity times 10 plus values for the dissolved O_2, Na, and Cl (in ppb).

15722 (EPRI-CS—4950, pp 14.1-14.15) **SCE experience.** Henderson, K.B. (Southern California Edison, Paramount CA). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

This paper discusses the operation of the chemical group associated with the Steam Generation Division of Southern California Edison (SCE). Philosophy of operation, current organization and duties, and one major study improvement effort (factors limiting condensate polisher performance) are discussed. The impact of the group's work on the condition of the equipment is also reviewed. The work in the area of steam purity as discussed in this paper can be reviewed in more depth by referring to EPRI Report CS-4005, Project 1408-3, May 1985. 1 table.

15723 (EPRI-CS—4950, pp 15.1-15.9) **Evaluation and use of iron dispersants in the Con Edison System.** Connick, B.J. (Consolidated Edison Co. of New York, Inc., Astorian). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

Con Edison began using iron dispersants in an attempt to reduce hydrogen embrittlement type failures. By keeping the preboiler corrosion products from accumulating on the boilers high heat input zones, hydrogen embrittlement failures would be reduced. The iron dispersants were used at the 1600 psig boilers at the East River and Waterside stations beginning in 1976. During the period from 1976-1980 tube failures were dramatically reduced and service hours between tube leaks increased from 800 hours to 27,000 hours. As a result of this success, the utility wanted to expand the use of these dispersants to include the higher pressure units. However, a better understanding of the measurement and dynamics of dispersants was still needed. The research program jointly developed by Con Edison, EPRI, and ESEERCO, the test loop design, and preliminary results from the program are described.

15724 (EPRI-CS—4950, pp 16.1-16.5) **EPRI fossil plant cycle chemistry programs.** Dooley, B. (Electric Power Research Institute, Palo Alto, CA). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

In 1984 EPRI formulated a series of projects (RP2712) to address the overall problem of cycle chemistry in fossil plants. The overall project is outlined in three parts: (1) RP2712-1 Interim Consensus Guidelines; (2) RP2712-2 Instrumentation and Control for Fossil Plant Cycle Chemistry; and (3) RP2712-3 Monitoring Cycle Chemistry in Fossil Fired Plant. Three ether related projects are also briefly described: (1) RP1184-9 Corrosion Product Transport in Cycling Fossil Plants; (2) RP1890-1 Boiler Tube Failure Manual; and (3) RP1608-1 Chemical Cleaning Manual.

15725 (EPRI-CS—4950, pp 17.1-17.16) **Cycle chemistry: sampling points and frequencies, presentation, and use of analytical data.** Axley, R.G. (Tennessee Valley Authority, Chattanooga). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

TVA currently has 11 fossil stations in service. These include 47 drum units on a coordinated phosphate boiler water treatment scheme, 5 drum units on an all-volatile boiler water treatment (AVT) program, and 7 once-through units also on AVT. The AVT drum units are higher pressure units (2400 pounds) while the phosphate-treated drum units are lower pressure (1400 to 2000 pounds). In addition, TVA has one fossil station, consisting of 4 low-pressure (850 pounds) phosphate-treated drum units, in a mothball storage status. The type and frequency of cycle monitoring is distinctly different for each of the three types of units described above. Tables are attached describing sampling locations in the cycle, the parameters monitored at each location, the limits specified for each parameter, and the minimum recommended frequencies of analyses of each type of unit. This information, along with analytical procedures, sampling procedures, chemical cleaning procedures, and discussions on various aspects of boiler water treatment, are included in TVA's Division of Fossil and Hydro Power Water Treatment Manual. The plant summaries are of little immediate use to central office personnel because of the time lag in receiving the data. However, they are of importance in evaluating long-term problems such as turbine deposits or unusually heavy amounts of metals removed during boiler chemical cleanings. Undoubtedly, a data base of steam cycle water chemistry with associated software analyses of this data would be of great benefit. However, this is a long-term future project for the central office staff. Initial inroads in this area have been made with NPDES permit analytical data and boiler cleaning data. 5 tables.

15726 (EPRI-CS—4950, pp 18.1-18.23) **Chemical analysis for fossil plant water chemistry.** Allmon, W.E. (Babcock & Wilcox, Alliance, OH). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

High quality analytical chemistry methods are required for both routine plant monitoring and research programs for fossil-fuel power generating plants. Inaccurate results can lead to improper decisions, which may result in expensive repairs and lost operating time. This paper discusses sampling equipment, sampling location and frequency, analytical methodology, and the collection and interpretation of analytical data. Differences between continuous and periodic analyses are also examined. 33 references, 4 figures, 6 tables.

15727 (EPRI-CS—4950, pp 19.1-19.15) **Fossil plant water chemistry - C.E.G.B. approach and experience.** Bates, A.J. (CEGB, Bristol, England). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

The CEGB supplies electricity in England and Wales, where there is a tendency to build power plants on coastal sites. Any condenser leakage, therefore, will involve chlorides so that water chemistry control involves the prevention of chloride-type corrosion. This paper describes approved guidelines, known as Generation Operation Memoranda, for the chemical control of steam/water circuits of power stations in the United Kingdom. Also discussed are on-load corrosion, choice of alkali, current CEGB practice for control of acid chloride corrosion, and an alternative acid chloride corrosion control concept.

15728 (EPRI-CS—4950, pp 20.1-20.18) **Adoption of water chemistry principles in fossil power plant design and operation.** Bursik, A. (Grosskraftwerk Mannheim Ag, West Germany). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

The interrelationships of water chemistry, operation, design, and materials are discussed for fossil fuel power plants in the FRG. Specifically this paper discusses the quality of water for the water/steam cycle, material selection, pre-operational chemical cleaning, water/steam cycle conditioning, condensate polishing, boiler water conditioning, operational chemical cleaning, change of operating mode, layup preservation, and corrosion fatique of turbine blades. 13 references, 17 figures.

15729 (EPRI-CS—4950, pp 21.1-21.17) **Fossil plant water chemistry in Japan.** Mizuno, T. (Central Research Institute of Electric Power Industry, Tokyo, Japan). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

A review is presented which briefly describes the share of fossil fuel power plants in the electric power industry of Japan; water quality specifications; boiler water treatment method; practical water chemistry; management of water chemistry; chemical cleaning; and new techniques. Tables present data on most of these aspects. 5 figures, 12 tables.

15730 (EPRI-CS—4950, pp 22.1-22.22) **Iron oxides in thermoelectric cycles: theoretical aspects and their possible influence on service.** Sturla, P. (ENEL, Piacenza, Italy). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

At the beginning of the 70's, ENEL had to face a problem which is typical of some once-through subcritical units. Rather fast deposition phenomena on partial flow control valves made frequent acid cleaning of the generator necessary, which penalized the service and the units availability. The solution was found in the correct utilization of hot operating pulverized resin filters and in the improvement of water-steam cycle conditioning. But on that occasion the investigation carried out by ENEL Central Laboratory was much more extensive than needed for an immediate solution of the problem; as a matter of fact it developed according to these guidelines: definition of deposition phenomena in its quantitative and qualitative terms; characterization of environment from a physico-chemical point of view; and study of nature of ionic and non-ionic species present in feed water for a correct parameterization of the physico-chemical environment. This paper describes the additional work by ENEL-DCO Central Laboratory, Piacenza, in an attempt to verify the validity of the hypotheses made at that time and extend them to the physico-chemical situation of the whole steam-water cycle. Iron oxides in the steam-water cycle are discussed, and analysis is presented of normal service conditions. 43 references, 3 figures, 2 tables.

15731 (EPRI-CS—4950, pp 23.1-23.17) **Operation and design requirements of cyclic steam turbines.** Silvestri, G.J. Jr. (Westinghouse Electric Corp., Orlando, FL). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

While Westinghouse steam purity recommendations are the same for base loaded and cycling steam turbines, operation outside of the recommended limits is more likely to occur with cycling units unless corrective measures are implemented. Although steam contaminants can result in component failure and plant outages, in some instance the consequences have been more benign. In the 1950s and 1960s, for example, there were problems with silica and copper deposits which resulted in increased operating costs because of efficiency and/or capacity degradation, but did not degrade turbine reliability. Oxygen content can increase markedly with cyclic operation because of (1) vacuum breaking during shutdown, (2) degradation of condenser deaerating performance below 50% load, (3) loss of the protection afforded by the deaerator and (4) high makeup requirements during startup. Excessive oxygen, either singly or in combination with other impurities, can accelerate pitting, lower fatigue strength and accelerate stress corrosion cracking. Phosphate and pH excursions have been experienced during shutdown and startup of cycling units. Control of these two variables is affected by the necessity for trickle feedwater on some boilers and the need to dump water to overcome boiler swell during startup. 19 references, 7 figures, 1 table.

15732 (EPRI-CS—4950, pp 24.1-24.8) **Experience with water chemistry control in cycling units at Detroit Edison.** Gilbert, W.D. (Detroit Edison Co., MI). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

For many reasons, cycling service is the most difficult service a unit may see. This type of service coming at what would normally be considered near the end of life for a unit, coupled with a new look at extending the life of units, presents a very real challenge for the plant chemistry staff. Some of the ways Detroit Edison, and others, are meeting this challenge are described. The areas discussed include: oxygen control on start-up; silica control on start-up; condensate polishing demineralizers; chemical cleaning frequency; continuous blowdown - continuous treatment; boiler layup; and chemistry surveillance.

15733 (EPRI-CS—4950, pp 25.1-25.28) **Water and steam chemistry control experiences with fossil peaking units.** Hagewood, B.T. (Long Island Lighting Co., NY). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

Load management at the Long Island Lighting Company, New York, involves the use of four steam-electric peaking units. Oxygen corrosion control using the following methods is discussed: steam pressure on the steam drum; vacuum on the condenser; dry storage; nitrogen blanketing water and steam contacted surfaces; catalyzed hydrazine; corrosion resistant alloys in the preboiler system. Boiler water silica control and boiler water pH-phosphate limits are also discussed. Recommendations are given. 10 references, 6 figures, 5 tables.

15734 (EPRI-CS—4950, pp 26.1-26.18) **Phosphate and other hide-out.** Stodola, J. (Ontario Hydro, Toronto). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

The majority of fossil fuel fired drum utility boilers in USA as well as a large number of units in Canada and Europe are operating on some form of phosphate boiler water treatment. The phosphate regime is superior for the protection of carbon steel boiler tubes on units experiencing frequent condenser tube leaks and having no or limited condensate polishing facilities. In addition there is statistical evidence showing a lower incidence of stress corrosion cracking damage in turbines coupled with boilers on phosphate chemical control. The in-service hide-out of phosphate and corresponding problems of boiler water alkalinity control has led some operators to switch to other boiler water treatments, namely low level caustic and all volatile treatment (AVT). The switch to AVT was not always without problems and, in fact, phosphate continues to be injected on many units regularly on AVT when a condenser tube leak is detected. The phosphate treatment would be even more popular if the uncertainty connected with hide-out phenomenon was alleviated. This paper describes the characteristics of chemical hide-out phenomenon, the conditions leading to hide-out, and solubilities of dissolved solids. The experimental data from two recent studies on chemical hide-out are presented and discussed. 17 references, 8 figures, 1 table.

15735 (EPRI-CS—4950, pp 27.1-27.16) **Corrosion product transport in a cycling fossil plant.** Hook, T.A.; Sawochka, S.G.; Pearl, W.L.; Scheibel, J.; Pugsley, J. (NWT Corp., San Jose, CA). Dec 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920148. (CONF-8506329—).

From Fossil plant water chemistry symposium; Atlanta, GA, USA (11 Jun 1985).

The objectives of this program are to determine the effect of major chemistry parameters (pH, hydrazine and oxygen) and operating procedures on corrosion and corrosion product transport in cyclic high pressure fossil boilers and to recommend methods that will reduce corrosion product transport thus leading to increased availability of these units. This report presents results from the first of a series of tests conducted at the Port Everglades Station of Florida Power and Light to quantify the effect of chemistry and operational changes on corrosion product transport during cyclic operation. Results are presented on condensate, feedwater, and boiler water chemistry. Corrosion product concentrations and mass transport are discussed. 8 figures.

15736 (EPRI-CS—5013) **Corrosion-resistant coatings for low-pressure steam turbines: Final report.** (Westinghouse Electric Corp., Orlando, FL (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. 261p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920233.

Inexpensive and readily available coatings - such as ion vapor-deposited aluminum and nickel cadmium electroplate - can control corrosion of components in low-pressure steam turbines. These coatings provide increased component life and unit availability without costly changes in turbine design or alterations in water chemistry.

15737 (PB—87-120531/XAB) **Materials for large land-based gas turbines. Final report, 1984-1986.** (National Materials Advisory Board (NRC), Washington, DC (USA)). 1986. 110p. (NMAB—430). NTIS, PC A06/MF A01.

Advanced large land-based gas turbines are expected to be a key component in the generation of electric power based on coal gasification and a combined-cycle gas turbine-steam turbine system. The development of gas turbines in the 120- to 150-MW range with turbine inlet temperatures of 2600°F at pressure ratios up to 16:1 is envisioned over the next 15 to 20 years. Currently available and developing materials technology useful for large machines is reviewed and discussed. Although the primary source of these developments is the aircraft engine field, other sources are also reviewed. Suitable technology appears to be available for the development of higher-power, long-life turbines for utility power generation. Recommendations are made for specific research and development efforts that address the special requirements and environment of these machines.

Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Further progress in the development of techniques for electric stimulation of fabric filtration (ESFF) will require participation of baghouse users in testing the concept and providing valuable feedback from full-scale operation experience. Participation is more likely to be assured if the ESFF system is simple, relatively inexpensive, and easy to maintain. The original system developed at the Textile Research Institute consisted of a bag fitted with alternate live and ground wires spaced an inch apart. An approach to simpler systems has taken the form of a charged axial electrode (or anode) with all bag electrodes grounded. The work described here centers on further simplification and optimization of this arrangement by studying the effect of anode diameter and number of grounded wires in the bag, including a system which requires no bag wires. 13 references, 8 figures, 1 table.

15739 (EPRI-CS—4918-Vol.3, pp 2.1-2.15) **Study of electrostatically stimulated filtration fundamentals.** Vanosdell, D.W.; Viner, A.S.; Carter, K.D.; Hovis, L.S. (Research Triangle Institute, Research Triangle Park, NC). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Electrostatically augmented (EA) filtration has been shown to perform better than conventional filtration. The fundamental causes of the improved performance remain unclear, however, and were the objects of this research. Preliminary results of bench-scale experiments conducted with an EA filter and of a mathematical modeling study of EA filtration are presented below. The performance of the experimental filter was evaluated by recording overall filter pressure drop at the operating face velocity and measuring filter permeability, dust cake mass, and dust cake porosity as functions of position on the filter. From these measurements, the specific resistance of the dust cake was calculated as a function of position on the filter. The mathematical model of the flow field and particle trajectories was used to predict the dust deposition pattern. Also, the dust cake resistance was estimated as a function of position and averaged over the filter surface. The model showed that inertial forces were negligible under most conditions and that gravitational, fluid drag, and coulombic forces controlled the motion of the particles as they approached the filter surface. Coulombic forces dominated the particle trajectories under many conditions and, apparently, caused the visible particle accumulation near the electrodes. Though coulombic forces accounted for the gross distribution of dust on the filter, other forces appear to control the fine structure of the dust cake. Porosity and specific dust cake resistance were relatively constant over most of the filter surface. At high field strengths, a small increase in porosity (and consequent decrease in dust cake flow resistance) was observed near the electrodes. 7 references, 11 figures.

(Research Triangle Institute, Research Triangle Park, NC). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Laboratory and pilot studies have demonstrated successfully that an advanced center-wire Electrically Stimulated Fabric Filter (ESFF) can be operated at a significantly lower pressure drop than a conventional reverse-air fabric filter. A comprehensive mathematical model has been developed to predict behavior and detailed deposition processes of the ESFF. The model incorporates flow modification that results from variations in particle distributions on the bag filter. Time-dependent gas streamlines, particle streamlines, and mass distributions are evaluated, and the corresponding areal mass density, pressure drop ratio (PDR), and modified specific resistance coefficient (K_s^*) are demonstrated for typical ESFF operating conditions. The results obtained from the model study illustrate a significant reduction in the pressure drop and provide an insight into the deposition process. Laboratory and pilot studies, performed for a range of operating parameters, support the model's conclusions. 3 references, 11 figures.

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Advanced electrical stimulation of fabric filtration (AESFF) consists of combining electrical precipitation with the usual process of electrically stimulated fabric filtration (ESFF). Through both laboratory and pilot studies EPA has demonstrated a significant improvement in performance when AESFF is applied. In particular, significant pressure drop reductions occur as a result of the reduced dust loading on the upper portions of the bags. This reduced pressure drop allows for the potential either to operate at a lower pressure drop or to operate at a higher gas flow rate. Areal mass density, cake thickness, and bulk mass density were measured for both resuspended spray dryer material and fly ash. Gas flow redistribution due to non-uniform dust cakes was observed to occur for pressure drops greater than 4 inches of water (996 Pa). Significant reductions in bulk mass density were observed due to deposition under the action of applied electric fields. 11 references, 12 figures.

15742 (EPRI-CS—4918-Vol.3, pp 6.1-6.20) **Advanced electrostatic fabric filtration experience at Southwestern Public Service Company.** Serrurier, R. Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

In October 1985, the advanced electrostatic fabric filtration (A-ESFF) configuration conversion of the pilot baghouse facility at Southwestern Public Service Company's Harrington Station was completed. Since initial start-up, evolutionary changes in both the operation and configuration have occurred. These changes are discussed herein. Results to date confirm the existence of a favorable A-ESFF effect. However, it has not been possible to sustain the effect in a steady-state manner. Reasons to explain this behavior have been proposed but remain to be confirmed by future experimental work. Experimental results to date are presented. 3 references, 12 figures.

(Environmental Protection Agency, Research Triangle Park, NC). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Advanced Electrostatic Stimulation of Fabric Filtration (Advanced ESFF), with its center-wire configuration which produces corona charging in particles to augment an external electrical field, has a performance edge over other electrostatic enhancement methods. Laboratory and pilot plant results show a consistently lower pressure drop and a rate of pressure drop rise that is 70% less than those of conventional filtration. A study of the economics of Advanced ESFF was undertaken to determine if the improved performance would more than compensate for the increased cost of electrical hardware and additional maintenance. The cost model that had been developed for conventional ESFF (parallel external field and no particle charging) was modified to account for the center-wire concept and used to compare Advanced ESFF capital and operating costs with those of conventional filters. The economic advantage of Advanced ESFF is based on its ability to operate at a higher air-to-cloth ratio while maintaining the same pressure drop as a conventional filter. The ability to operate with higher air-to-cloth ratios translates to capital cost savings due to smaller baghouse size. 11 references, 7 figures.

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

A detailed test program was conducted for fabric filter bags procured under the same specification from various bag fabricators, weavers, and finishers of fabric material. The filter bags were inspected for the integrity of the fabric, quality of fabrication and then installed in the same compartment of the N.S.P. Riverside baghouse for field testing. This paper describes the test procedures and presents the results of bag fabrication inspection and field evaluation for this specific type of fabric filter bag. Based on the test results of this test program, specific procedures of bag procurement are recommended. 6 figures, 6 tables.

(General Electric Environmental Services, Inc., Lebanon, PA). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

The catenary-like shapes and the corresponding tensions along a utility-size fabric filter bag during reverse-gas cleaning have been calculated by an iterative technique which ensures consistency between the bag tensions and deflections, including the effect of bag stretch under tension. The maximum bag deflections occurring midway in each bag segment between successive anti-collapse rings are first calculated. The axial gas velocities are then deduced from these deflections assuming a constant reverse gas-to-cloth ratio across the entire bag. Characteristics of a given ring spacing, including curves of calculated deflection and axial gas velocity vs. height are used to compare the effects of reverse-gas pressure drop, dust weight on bag, and springs of variable length and spring constant. This catenary model is useful for optimizing spring design for specialized baghouse operating conditions, such that critical bag parameters and the maximum axial gas velocity during reverse gas cleaning are within design limits. The analysis shows that the spring tension during reverse-gas cleaning is independent of spring constant provided the spring if fully compressed during the reverse flow. The spring tension during reverse-gas is shown to be much larger than its pre-tension value. Fully compressed operation of the bag spring during reverse-gas flow is shown to be advantageous for baghouse operation. A simple model for explaining the observed time-variation of the bag tension due to the fall of the plug-like dust released within the bags, is also presented. The predictions of this model may be used to factor into the catenary analysis of a bag suspension system, the effects of the time-varying spring tension during reverse-gas flow. 4 references, 11 figures.

Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

To study the effects of flue gas from burning eastern, high-sulfur coal on the performance of fabric filters, the Electric Power Research Institute is evaluating the performance of a 10-MW pilot-scale baghouse. Operation over the past 40 months included cleaning by reverse-gas, reverse-gas with sonic assist and shake/deflate. Outlet emissions were below 0.004 lb/million Btu, and collection efficiencies were greater than 99.9%. The pressure drop across the bags was 5.5 in. H_2O or less for filtering times of three hours. For reverse-gas cleaning, residual dustcake weights were about 1.0 lb/ft^2 versus less than 0.5 lb/ft^2 for sonic-assisted and shake/deflate cleaning. Dustcake weight was also sensitive to startup and shutdown procedures, and it increased rapidly with more frequent shutdowns. High bag failure rates occurring during the shake/deflate operation may be attributable to excessive deflation flows or shaking accelerations. 1 reference, 7 figures, 1 table.

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Baghouse performance has been shown to be dependent on both the chemical and physical properties of the ash. Small amounts of ammonia and sulfur trioxide were added to the flue gas as conditioning agents to modify ash characteristics and reduce fine particulate emissions from a pilot-scale coal combustion/baghouse system. Tests were made with three western low-rank coals which produce difficult-to-collect fly ash. Total particulate emissions over several cleaning cycles were substantially reduced and fine particulate emissions were reduced up to four orders of magnitude between the cycles. With conditioning baghouse pressure drop increased at a slower rate and reached a lower operating pressure drop after several cleaning cycles. Ash samples were analyzed to determine physical and chemical changes due to ammonia and sulfur trioxide addition. Several ammonia-sulfur compounds were found indicating a complex chemical mechanism. Changes in the fly ash particle size distribution and bulk ash cohesiveness may help explain the physical mechanism by which both pressure drop and particulate emissions are reduced. 14 references, 7 figures, 4 tables.

The damper, deflation air, shaker, and bag systems of the baghouse of this Texas utility are described. Operation and maintenance of the shake/deflate baghouse controlling flyash emissions in a 360 MW coal-fired plant are discussed. Cost data on the various systems are provided. Discussion of bag life is also presented. 3 figures, 6 tables.

15750 (EPRI-CS—4918-Vol.3, pp 16.1-16.10) **Computer monitoring of pilot plant baghouse performance.** Viner, A.S.; Fickel, L.M.; Hovis, L.S. (Research Triangle Institute, Research Triangle Park, NC). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

A computerized monitoring system was installed on a pilot plant baghouse to permit unattended operation of the unit. Sensors were installed to measure inlet and outlet gas temperatures, pressure drops across flow orifices, tubesheet pressure drops, and electrical conditions in an electrostatically augmented compartment. The signal lines from these sensors were connected to a programmable datalogger which also served as the interface to a microcomputer. Data were recorded on the data logger and stored on a fixed disk in the microcomputer. A modem coupled with computer software allowed researchers to call the microcomputer from long distance and collect data daily. Once retrieved, the data were quickly analyzed to evaluate performance and to identify any problems in operation. In addition, the datalogger could be reprogrammed through the phone link. The strip chart from the datalogger served as a backup of the data recorded on the microcomputer disk. The system worked very well for the duration of the project with the exception of a few minor problems. Daily analysis of the data permitted timely evaluation of the progress of the experiments and the status of equipment. The goal of unattended operation was achieved and would not have been possible without this system. A possible enhancement would be the addition of a relay board to the datalogger, thereby permitting a limited amount of remote control over process variables. 2 references, 4 figures.

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

This paper describes a successful effort to improve performance of three electrostatic precipitators at the Sandow Generating Station, Rockdale, Texas. Their installation in 1973 required an efficiency of 98%. Recent operation has not been satisfactory, allowing emissions in excess of their design value. As part of the Sandow Betterment Program, Bechtel Power Corporation was asked to study the performance of the precipitators and to make recommendations to improve their performance. The study included evaluation of operating data, performance testing, rapping acceleration tests, gas flow distribution tests, and precipitator modeling. Following evaluation of the tests, Bechtel made several recommendations; these included changes to the rapping system and the automatic voltage control system. The modifications, installed by Bechtel, have resulted in the following improvements: emission reductions of greater than 45% and opacity excursion reductions of over 75%. The tests conducted and details of improvements are presented in this paper. 7 figures.

(General Electric Environmental Services, Inc., Lebanon, PA). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Burlington Electric, J.C. McNeil Generating Station is the largest (50MW) wood fired power plant in the US. Mechanical cyclones and an electrostatic precipitator (ESP) are used in series to meet the stringent emission limit of 0.003 grains/acf. During initial operation, the particulate collection system experienced internal fires as well as plugging of cyclone and ESP hoppers. The cause of this problem was determined to be a combination of high combustible content of the fly ash, low cyclone efficiency resulting from lower than design gas flow rate, and improper operation of the fly ash removal system. A detailed system analysis was performed to identify operational modifications which were implemented with minimal disruption to plant operation. The corrective measures improved cyclone collection efficiencies, eliminated the fires and significantly improved performance and reliability of the fly ash removal system. Since the modifications were completed in October 1984, the particulate collection system has been operating smoothly, and has consistently exceeded particulate emission reduction requirements. 8 figures, 3 tables.

15753 (EPRI-CS—4918-Vol.3, pp 23.1-23.20) **Measurement of fugitive emissions in a coal-fired power plant.** Muleski, G.E.; Pendleton, F.J.; Rugenstein, W.A. (Midwest Research Institute, Kansas City, MO). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Coal-fired power plants contain several potential sources of airborne fugitive emissions, and utilities and regulatory agencies face an increasing need to estimate these emissions. This paper presents the methodology and results of a field testing program designed to characterize size-specific emissions from two sources at a modern power plant - the loading of fly ash into truck/trailer combinations and wind erosion of various surfaces within the plant's coal yard. Test results are used to determine annual emission rates which are compared to estimates using models available in the literature. 10 references, 7 figures, 8 tables.

Today's power systems often operate under stressed conditions. The tools contained in this software package will help utility personnel determine safe loading and operating procedures under such conditions. They will also be useful in designing future systems that can withstand major disturbances.

15760 (LBL—22261) Development of large high-voltage pressure insulators for the Princeton TFTR [Tokamak Fusion Test Reactor] flexible transmission lines. Scalise, D.T.; Fong, E.; Haughian, J.; Prechter, R. (Lawrence Berkeley Lab., CA (USA); Princeton Univ., NJ (USA). Plasma Physics Lab.). Oct 1986. Contract AC03-76SF00098. 8p. (CONF-861114—27). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87002544.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

Specially formulated insulator materials with improved strength and high-voltage properties were developed and used for critical components of the flexible transmission lines to the TFTR neutral beam ion sources. These critical components are plates which support central conductors as they exit the high-voltage power supply and enter the ion source enclosure. Each plate acts both as a high-voltage insulator and as a pressure barrier to the SF_6 insulating gas. The original plate was made of commercial glass-epoxy laminate which limited the plate voltage capacity. The newly developed insulator is made of specially-formulated cycloaliphatic Di-epoxide whose isotropic properties exhibit increased arc resistance. It is cast in one piece with skirts which greatly increase the breakdown voltage. This paper discusses the design, fabrication and testing of the new insulator.

15761 (BARC—1288) Low incremental control worth reload patterns for BWRs. (Bhabha Atomic Research Centre, Bombay (India)). 1985. 26p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701255.

A new scheme for constructing reload patterns for BWR cores has been developed. This scheme is obtained essentially by rotating the axes of reflective symmetry of reload patterns through 45 deg. As compared to the current scheme, this scheme results in a more uniform distribution of worths among the control elements during their in-sequence withdrawal for taking the core to criticality. This new scheme also leads to improved safety characteristics like higher shut down margin, higher thermal margins during operation, and reduction in thermal shocks to the fuel assemblies. 6 refs., 12 tables, 5 figures.

15762 (BARC—1298) Tarapur dual cycle BWR - analysis of steam generator bypass incident. (Bhabha Atomic Research Centre, Bombay (India)). 1986. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701261.

The falling of the cover plate located on the partition plate of the Secondary Steam Generator (SSG) of one of the Tarapur Atomic Power Reactors caused the bypass of the SSG tubes resulting in a reactor trip. Steady state flow analysis shown the hydraulic characteristics in the recirculation loop after the incident. Transient analysis shows the cause for the trip and the safety implications. 7 figs.

15763 (CONF-8610135—43) Flaw density examinations of a clad boiling water reactor pressure vessel segment. Cook, K.V.; McClung, R.W. (Oak Ridge National Lab., TN (USA)). 1986. Contract AC05-84OR21400. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004077.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

Flaw density is the greatest uncertainty involved in probabilistic analyses of reactor pressure vessel failure. As part of the Heavy-Section Steel Technology (HSST) Program, studies have been conducted to determine flaw density in a section of reactor pressure vessel cut from the Hope Creek Unit 2 vessel [nominally 0.7 by 3 m (2 by 10 ft)]. This section (removed from the scrapped vessel that was never in service) was evaluated nondestructively to determine the as-fabricated status. We had four primary objectives: (1) evaluate longitudinal and girth welds for flaws with manual ultrasonics, (2) evaluate the zone under the nominal 6.3-mm (0.25-in.) clad for cracking (again with manual ultrasonics), (3) evaluate the cladding for cracks with a high-sensitivity fluorescent penetrant method, and (4) determine the source of indications detected.

15764 (CONF-8610135—55) BWR pipe crack remedies evaluation. Shack, W.J.; Kassner, T.F.; Maiya, P.S.; Park, J.Y.; Ruther, W.E. (Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 18p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004934.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

This paper presents results on: (a) the influence of simulated BWR environments on the stress-corrosion-craking (SCC) susceptibility of Types 304, 316NG, and 347 stainless (SS); (b) fracture-mechanics crack-growth-rate measurements on these materials and weld overlay specimens in different environments; and (c) residual stress measurements and metallographic evaluations of conventional pipe weldments treated by a mechanical-stress-improvement process (MSIP) as well as those produced by a narrow-gap welding procedure. Crack initiation studies on Types 304 and 316NG SS under crevice and non-crevice conditions in 289°C water containing 0.25 ppM dissolved oxygen with low sulfate concentrations indicate that SCC initiates at very low strains (<3%) in the nuclear grade material. Crack growth measurements on fracture-mechanics-type specimens, under low-frequency cyclic loading, show that the Type 316NG steel cracks at a somewhat lower rate (~40%) than sensitized Type 304 SS in an impurity environment with 0.25 ppM dissolved-oxygen; however, the latter material stops cracking when sulfate is removed from the water. Crack growth in both materials ceases under simulated hydrogen-water chemistry conditions (<5 ppB oxygen) even with 100 ppB sulfate present in the water. An unexpected result was obtained in the test on a weld overlay specimen in the impurity environment, viz., the crack grew to the overlay interface at a nominal rate, branched at 90° in both directions, and then grew at high rate (parallel to the nominal applied load). Residual stress measurements on MSIP-treated weldments and those produced by a narrow-gap welding procedure indicate that these techniques produce compressive stresses over most of the inner surface near the weld and heat-affected zones.

15765 **(CONF-8610135—59) Aging degradation of cast stainless steel.** Chopra, O.K.; Chung, H.M. (Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 42p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004939.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

A program is being conducted to investigate the significance of in-service embrittlement of cast duplex stainless steels under light-water reactor operating conditions. Microstructures of cast materials subjected to long-term aging either in reactor service or in the laboratory have been characterized by TEM, SANS, and APFIM techniques. Two precipitate phases, i.e., the Cr-rich α' and Ni- and Si-rich G phase, have been identified in the ferrite matrix of the aged steels. The results indicate that the low-temperature embrittlement is primarily caused by α' precipitates which form by spinodal decomposition. The relative contribution of G phase to loss of toughness is now known. Microstructural data also indicate that weakening of ferrite/austenite phase boundary by carbide precipitates has a significant effect on the onset and extent of embrittlement of the high-carbon CF-8 and CF-8M grades of stainless steels, particularly after aging at 400 or 450°C. Data from Charpy-impact, tensile, and J-R curve tests for several heats of cast stainless steel aged up to 10,000 h at 350, 400, and 450°C are presented and correlated with the microstructural results. Thermal aging of the steels results in an increase in tensile strength and a decrease in impact energy, J/sub IC/, and tearing modulus. The fracture toughness results show good agreement with the Charpy-impact data. The effects of compositional and metallurgical variables on loss of toughness are discussed.

15766 **(CONF-8611120—1) Technical basis for normal water chemistry guidelines: Review of laboratory studies of water chemistry effects on SCC [stress corrosion cracking].** Kassner, T.F.; Maiya, P.S.; Park, J.Y.; Ruther, W.E.; Shack, W.J.; Soppet, W.K. (Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004701.

From Seminar on BWR corrosion, chemistry, and radiation control; Palo Alto, CA, USA (10 Nov 1986).

The influence of dissolved oxygen, hydrogen, and various impurity anions on the stress corrosion cracking (SCC) susceptibility of sensitized Type 304 stainless steel (SS) and alternative piping materials such as Types 316NG and 347NG SS is being investigated in constant-extension-rate-tensile (CERT) tests and in cyclic loading experiments on fatigue precracked fracture-mechanics-type specimens at 289°C. In these experiments, the crack growth behavior of the materials is being correlated with the impurity concentration and the electrochemical potentials of Type 304 SS and platinum electrodes in simulated BWR normal operating environments ($\sim$ 200 to 300 ppb oxygen and $<$ 100 ppb of various oxyanions of halides added as acid or salts, at a total conductivity of <1 μS/cm).

15767 (EPRI-CS—4748, pp 4.1-4.22) **BWR control rod drive scram pilot valve monitoring program.** Soden, R.A.; Kelly, V. (NDT International, Inc., West Chester, PA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

The control rod drive system in a Boiling Water Reactor is the most important safety system in the power plant. All components of the system can be verified except the solenoid operated, scram pilot valves without scramming a rod. The pilot valve mechanical works is the weak link to the control rod drive system. These pilot valves control the hydraulic system which applies pressure to the insert side of the control rod piston and vents the withdraw side of the piston causing the rods to insert during a scram. The only verification that the valve is operating properly is to scram the rod. The concern for this portion of the system is demonstrated by the high number of redundant components and complete periodic testing of the electrical circuits. The pilot valve can become hung-up through wear, fracture of internal components, mechanical binding, foreign material or chemicals left in the valve during maintenance, etc. If the valve becomes hung-up the electrical tests performed will not indicate this condition and scramming the rod is in jeopardy. Only an attempt to scram a rod will indicate the hung-up valve. While this condition exists the rod is considered inoperative. This paper describes a system developed at a nuclear power plant that monitors the pilot valves on the control rod drive system. This system utilizes pattern recognition to assure proper internal workings of the scram pilot valves to plant operators. The system is totally automatic such that each time the valve is operated on a half scram, a printout is available to the operator along with light indication that each of the 370 valves (on one unit of a BWR) is operating properly. With this monitoring system installed, all components of the control rod drive system including the solenoid pilot valves can be verified as operational without scramming any rods.

15768 **(EPRI-NP—4222-Vol.5) Compilation of corrosion data on the CAN-DECON process: Volume 5, Influence of the CAN-DECON process on stress corrosion cracking: Summary of testing, 1984-1985: Final report.** Smee, J.L.; Turner, V.C. (London Nuclear Ltd., Niagara Falls, Ontario (Canada); Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. 24p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920217.

This report summarizes those studies conducted in 1984 and 1985 which dealt with intergranular attack and intergranular stress corrosion cracking in sensitized specimens of stainless steel 304 and Inconel 600 after exposure to the CAN-DECON LND-101A dilute chemical decontamination process. During this period London Nuclear initiated 3 test programs, 2 under BWR conditions and 1 under PWR conditions. In none of the programs was there any indication that the test specimens were more susceptible to SCC than the controls. The failure times for those specimens that were pulled to failure were essentially the same for the test specimens and controls. None of the specimens exhibited IGA.

15769 **(EPRI-NP—4817) Properties of colloidal corrosion products and their effects on nuclear plants: Final report.** Matijevic, E. (Clarkson Univ., Potsdam, NY (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Dec 1986. 68p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920218.

A number of different solid particles found in nuclear reactor coolant have been produced in the laboratory. Such particles result from corrosion processes at metal piping and component surfaces. The particles produced and studied in this work differ from those observed in power plant water in two respects: (1) they are all of one narrowly controlled particle diameter and particle shape; (2) they are all of one simple composition - such as magnetite or hematite. The methods for making new supplies of these particles are provided for use by those wishing to study, for example, how best to dissolve surface oxides during a decontamination of plant piping surfaces. The model oxides aid in sorting out the proper dissolution procedures by providing a well-defined simulation of each separate constituent of plant surfaces in a form where dissolution rates are easily measured. Measurements of the properties of magnetite, hematite, and nickel-iron-cobalt ferrites relevant to radioactive cobalt-60 transport have been made and are reported in summary form. Some of these properties studied are (1) cobalt adsorption as a function of temperature and pH; (2) magnetic properties to assess the ease of magnetic filtration; (3) dissolution rates by the commonly employed decontamination chemicals. Copies of 41 separate scientific journal publications resulting from this work are reproduced in microfiche in the back cover pocket.

15770 **(EPRI-NP—5001) Characterization of the performance of major LWR components: Final report.** Koppe, R.H.; Olson, E.A.J.; LeShay, D.W.; DeAngelis, D. (Stoller (S.M.) Corp., Boulder, CO (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. 82p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920224.

This report presents results of a project conducted by The S.M. Stoller Corporation for EPRI. The purpose of the project was to characterize historical experience of US light water reactor units with respect to major component failures and modifications. This characterization can then be used as a benchmark for projections of

the impact of problems and refurbishments on units nearing or past the end of their original design life.

15771 **(EPRI-NP—5008) Evaluation of sulfur hexafluoride and helium for steam generator leak location: Final report.** Kassen, W.R. (NWT Corp., San Jose, CA (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. 70p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920225.

Since the use of sulfur hexafluoride as a tracer for identifying sources of primary to secondary leakage in PWR steam generators appeared to offer significant sensitivity advantages, the thermal stability of sulfur hexafluoride in water was evaluated at steam generator operating temperature. Significant decomposition was observed after 2 to 4 hours at temperature. Key decomposition products were fluoride and sulfide ions. Based on this observation and these limited test results, the use of SF_6 for PWR steam generator leak location can not be recommended at this time. A survey of 15 utilities was conducted in regard to their application experience with the helium tracer-mass spectroscopy technique for steam generator leak location. Although several successful steam generator integrity programs do not include use of this technique, it has proven to be a useful addition to the inspection program at some plants. No corrosion concerns appear to be associated with this technique.

15772 **(EUR—10043) Decontamination by water jet, chemical and electrochemical methods.** Gauchon, J.P.; Mordenti, P.; Bezia, C.; Fuentes, P.; Kervegant, Y.; Munoz, C.; Pierlas, C. (Commission of the European Communities, Luxembourg). 1986. 87p. (In French). NTIS (US Sales Only), PC A05/MF A01. File Number DE87750543.

The decontamination tests have been carried out on samples coming from representative specimens from primary circuit of the PWR and on samples coming from the emergency feed water piping of the German BWR (Isar). The oxide found in PWR primary loops can only be removed by a two steps process. The initial embrittling step is particularly effective in hot alkaline permanganate medium. Oxidation by ozone treatment is less effective. The second step involves chemical erosion of the metal in nitrofluoric acid in conjonction with ultrasonic agitation. Among the reagents used, only oxalic acid is suitable for electrolytic decontamination. Among the reagents possible for decontamination of the Isar specimens (ferritic steel lined with hematite) halogenous acid in mixture without or with oxygenated water, sulfuric acid, the formic acid/formaldehyde mixture are chosen. Metal erosion with high pressure jet as well as the decontamination efficiency on parts lined with hematite have made possible to determine the best conditions. 33 figs, 29 refs.

15773 **(NUREG/CR—4300-Vol.3-No.2) Acoustic emission/flaw relationship for in-service monitoring of nuclear pressure vessels: Progress report, April 1986-September 1986.** Hutton, P.H. (Pacific Northwest Lab., Richland, WA (USA); Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering Safety). Jan 1987. Contract AC06-76RL01830. 13p. (PNL—5511-Vol.3-No.2). NTIS, PC A02/MF A01 - GPO. File Number TI87005635.

This report discusses technical progress for the period April 1986 to September 1986 for the NRC-sponsored research program concerned with "Acoustic Emission/Flaw Relationships for Inservice Monitoring of Nuclear Reactor Pressure Boundaries." Included in the discussion are the topics of AE monitoring of primary piping during reactor operation, substantiation of the AE signal identification method, development of AE/IGSCC relationships, and progress in establishing an ASTM AE standard and an ASME code appendix for on-line AE monitoring.

15774 **(EPRI-NP—4574-CCM-Pt.2-Ch.7-Vol.1) ARMP-02 documentation: Part 2, Chapter 7, MICBURN-E computer code manual: Volume 1, Theory and numerics manual.** Jones, D.B. (Levy (S.), Inc., Campbell, CA (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Dec 1986. 61p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920228.

MICBURN-E is a multigroup pin cell lattice physics computer code designed for the burnup analysis of light water reactor fuel rods. It was specifically developed to handle fuel rods containing an initially homogeneous mixture of fuel (UO_2) and burnable absorber (Gd_2O_3) compositions. MICBURN-E features a fine mesh geometry model which makes it particularly suitable for the analysis of fuel rods which burn according to the phenomenon for "onion-skin" depletion effects. MICBURN-E employs integral transport theory based upon the method of collision probabilities to calculate neutron flux distributions and eigenvalues for cylindrical geometries. The primary application of MICBURN-E is to generate a burnable absorber data file containing effective microscopic absorption cross sections as a function of burnup for a pseudo nuclide. This file is then supplied as input to various assembly lattice physics codes including CPM-2, EPRI-CPM and CASMO-1. MICBURN-E is written entirely in FORTRAN and is supplied with a Nuclear Data Library which contains basic microscopic cross sections and burnup parameters for several nuclides.

15775 **(EPRI-NP—4574-CCM-Pt.2-Ch.12-Vol.3) ARMP-02 documentation: Part 2, Chapter 12, NORGE-B2 computer code manual: Volume 3, Programmer's manual.** Jones, D.B.; Anderson, M.J. (Levy (S.), Inc., Campbell, CA (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Dec 1986. 128p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920248.

NORGE-B2 is a computer code which provides linkage between the assembly lattice physics codes CPM-2, EPRI-CPM and CASMO-1 and the nodal simulation code SIMULATE-E. NORGE-B2 produces card image data files for hot and cold SIMULATE-E models. These cards contain cross-sectional data tabulated as functions of several operational parameters. The important parameters include exposure, moderator densities, control rod presence and power (Doppler). NORGE-B2 is run for each assembly fuel type in the SIMULATE-E model. It also generates card images containing kinetics data for the SIMTRAN-E computer code which links these same assembly lattice physics codes to the RETRAN code. NORGE-B2 is written entirely in FORTRAN.

15776 **A reduced-order model of boiling water reactor linear dynamics.** March-Leuba, J. (The Univ. of Tennessee, Dept. of Nuclear Engineering, 315 Estabrook Drive, Knoxville, TN 37916). *Nuclear Technology;* **75**: No. 1, 15-22(Oct 1986).

The development of a reduced-order linear model of the linear dynamic behavior of boiling water reactors (BWRs) is reported. The model is based on a detailed study of the various physical dynamic processes involved. The major results of the work are (a) the pole-zero configuration of the transfer function of this type of reactor has been determined, (b) a minimum of three zeros and four poles is needed to properly represent this transfer function, (c) these poles and zeros have been associated with reactor physical processes such as fuel heat transfer dynamics, and (d) a reduced-order linear model composed of only five equations has been developed. With the appropriate parameters, the model very accurately represents the dynamic behavior of BWRs predicted by fine-mesh computer calculations.

15777 **(EPRI-NP—4574-CCM-Pt.2-Ch.2-Vol.2) ARMP-02 documentation: Part 2, Chapter 12, NORGE-B2 computer code manual: Volume 2, User's manual.** Jones, D.B.; Anderson, M.J. (Levy (S.), Inc., Campbell, CA (USA); Electric Power Research Inst., Palo Alto, CA (USA)). 1986. 135p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920247.

NORGE-B2 is a computer code which provides linkage between the assembly lattice physics codes CPM-2, EPRI-CPM and CASMO-1 and the nodal simulation code SIMULATE-E. 15778 **Nuclear fuels accounting interface: River Bend experience.** Barry, J.E. (Gulf States Utilities Co., Beaumont, TX). *Transactions of the American Nuclear Society;* **53**: 76(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This presentation describes nuclear fuel accounting activities from the perspective of nuclear fuels management and its interfaces. Generally, Nuclear Fuels-River Bend Nuclear Group (RBNG) is involved on a day-by-day basis with nuclear fuel materials accounting in carrying out is procurement, contract administration, processing, and inventory management duties, including those associated with its special nuclear materials (SNM)-isotopics accountability oversight responsibilities as the Central Accountability Office for the River Bend Station. As much as possible, these duties are carried out in an integrated, interdependent manner. From these primary functions devolve Nuclear Fuels interfacing activities with fuel cost and tax accounting. Noting that nuclear fuel tax accounting support is of both an esoteric and intermittent nature, Nuclear Fuels-RBNG support of developments and applications associated with nuclear fuel cost accounting is stressed in this presentation.

15779 **LWR Fuel failure detection using the grip sipping method.** Savolainen, K. (Imatran Voima Oy, Helsinki, Finland). *Transactions of the American Nuclear Society;* **53**: 87-88(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the case of fuel leakages, the sipping of the fuel assemblies to be reloaded often directly affects the length of the outage period. In this investigation the aim has been to develop a sipping method that can be used during normal fuel discharge. Hence, the sipping would not cause any substantial extension of the shutdown. Some experimental sipping equipment has been built and tested in the Loviisa pressurized water reactor power plant run by the Imatran Voima Power Company.

15780 **Performance of boiling water reactor fuel lead test assemblies to 35 MWd/kg U.** Rowland, T.C.; Ikemoto, R.N.; Gehl, S. (General Electric, San Jose, CA). *Transactions of the American Nuclear Society;* **53**: 89-90(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This joint Electric Power Research Institute/General Electric (EPRI/GE) fuel performance program involved thorough preirradiation characterization of fuel used in lead test assemblies (LTAs), detailed surveillance of their operation, and interim site examinations of the assemblies during reactor outages. The program originally included four GE-5 LTAs operating in the Peach Bottom-2 (PB-2) reactor. The program was later modified to include the pressurized fuel rod test assembly in the Peach Bottom-3 (PB-3) reactor. The program modification also included extending the operation of the PB-2 and PB-3 LTA fuel beyond normal discharge exposures. Results are summarized in the paper.

15781 **Optimization of spent-fuel storage equipment with extended burnup.** Anderson, C.K.; Burns, W.J.; Klotz, R.J. *Transactions of the American Nuclear Society;* **53**: 104-105(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Most utilities are pursuing extended fuel burnup for reasons attributable to the front end of the fuel cycle, however, increased burnup has several influences on the back end of the fuel cycle as well. For example extended burnup is one of the easiest and most economical ways to reduce storage requirements. As shown in the paper maximum at reactor (AR) storage requirements can be reduced by as much as 50% by the year 2000 by increasing fuel exposure ~ 3% per year from 1985 through 2000 [e.g., to ~45,000 MWd/ton heavy metal (HM) for pressurized water reactors and 38,000 MWd/ton HM for boiling water reactors], which in turn extends the useful life of existing storage capacity. A design objective of cask manufacturers is to simplify and minimize the maintenance and monitoring requirements for long-term storage. Taking credit for the known irradiation history in discharged fuel and the fact that this fuel has low residual reactivity is one way to achieve this objective.

15782 **Application of high-burnup experience to consolidation equipment design.** Matheson, J.E. (Babcock & Wilcox). *Transactions of the American Nuclear Society;* **53**: 108-109(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Fuel consolidation equipment being designed and built for use at repositories or reactor sites have the common design objectives of maximizing packing and throughput while minimizing contamination and personnel exposure. In establishing design parameters for these systems, it is necessary to consider limiting cases. The effects of burnup could impact adversely on the operation and throughput of consolidation equipment. If proper consideration is given during the design process to high-burnup fuel, however, these impacts can be minimized. For the limiting cases of 60 GWd/ton U for pressurized water reactor (PWR) fuel and 50 GWd/ton U for boiling water reactor fuel, the impact of burnup on equipment design is assessed and equipment design applications are suggested.

15783 **Steady-sate and load-follow characteristics of various BWR fuel designs.** Takei, K.; Kogai, T.; Matsumoto, T.; Umehara, H.; Uchida, M. *Transactions of the American Nuclear Society;* **53**: 219-220(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper describes the results of an irradiation study carried out in the Halden boiling water reactor (HBWR). The objective of this irradiation was to clarify the performance of various BWR fuel designs - helium prepressurization (0.3 MPa), pellet shape modification (annular and short-length annular) and barrier cladding (copper and zirconium) - under steady-state and load-follow operations.

15784 **Improved numerical method for subchannel cross-flow calculations.** Kaya, S.; Anghaie, S. (Oregon State Univ., Corvallis). *Transactions of the American Nuclear Society;* **53**: 263-265(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

COBRA-OSU is a fast running computer code for coupled kinetic and thermal-hydraulic analysis of nuclear reactor core subchannels, currently under development at Oregon State University. This code is a modified version of COBRA-IV with two major improved features. First, COBRA-OSU uses the Gaussian elimination method instead of Gauss-Seidel iteration for subchannel cross-flow calculation. Second, COBRA-OSU has an additional model for regionwise point reactor kinetics which includes all major feedback reactivity effects on calculation of the axial power profile during the course of a transient. This paper summarizes the improved numerical features of the COBRA-OSU code.

15785 **Equipment and procedural modifications to improve the reliability of Terry turbines used in nuclear service.** McNeill, H. *Transactions of the American Nuclear Society;* **53**: 380-381(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Terry turbines are used to drive auxiliary feedwater and emergency cooling water pumps for pressurized water (PWR) and boiling water reactor (BWR) nuclear power plants. The record indicates that of all nuclear plants in service or under construction, ~95% of the installations using turbo pump systems have called for Terry solid wheel turbines. A case study has been completed by the US Nuclear Regulatory Commission (NRC) to review past operating experience involving overspeed trips of PWR auxiliary feedwater (AFW) turbine-driven pumps, and BWR high-pressure coolant injection (HPCI) and reactor core isolation cooling (RCIC) turbine-driven pumps. As this study pointed out, that although the reliability of PWR AFW systems was of primary concern, the operational problems of AFW, HPCI, and RCIC systems were quite similar. Similarly, this paper is concerned with the PWR AFW systems with extension possible to BWR HPCI and RCIC systems.

Data are presented to show how modifications can be made to the AFW turbine system to improve reliability and address the deficiencies resulting from spurious overspeed trip, water induction, and delayed restart of PG governor systems. The effect of water induction has been evaluated and data are presented from tests conducted at Terry. Procedural improvements are discussed briefly.

15786 **Development and implementation of visual weld acceptance criteria for Brunswick Steam Electric Plant.** Williamson, K.; Hologa, J. (Carolina Power and Light, Southport, NC). *Transactions of the American Nuclear Society;* 53: 401(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of this paper is to describe the development and implementation of visual weld acceptance criteria (VWAC) that provide design integrity and allow some imperfections in welds. The goal was to reduce the cost of welding at nuclear power plants. The Nuclear Construction Issues Group (NCIG) was initially conceived to address certain technical and administrative nuclear plant construction issues. In February 1985, NCIG issued a draft of Visual Weld Acceptance Criteria for Structural Welding at Nuclear Power Plants (NCIG-01). After numerous working sessions with the US Nuclear Regulatory Commission (NRC), comments were resolved and NCIG-01 Revision 2 was conceptually approved by the NRC in June 1985. The conceptual NRC approval of NCIG-01 triggered the Brunswick Steam Electric Plant (BSEP) engineering staff of Carolina Power and Light to develop VWAC specification. The specification included the basic requirements of NCIG-01. It is an inspection document defining the acceptability of welds. Full implementation began December 18, 1985. Estimates prior to VWAC established 2 h of post-weld preparation for every 1 h of welding. After field surveys it became apparent that with BSEP VWAC, 1 h of welding would require only 1/2 h of post-weld preparations.

15787 **Long-range goal setting in the nuclear utility industry.** Beard, P.M. (Institute of Nuclear Power Operations, Atlanta, GA). *Transactions of the American Nuclear Society;* 53: 431-432(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Institute of Nuclear Power Operation's (INPO's) programs support the industry's efforts to improve performance in nuclear plant safety and reliability. The success of these programs can best be measured by the progress of the industry. As utilities focused their attention on nuclear plant performance, the Institute's goal was to make sure its programs and activities provided the best possible support for these efforts. INPO continues to coordinate an industry-wide plant performance indicator program to assist member utilities in assessing station performance. Closely related to this effort is the nuclear industry's establishment of long-range plant performance goals. The US nuclear utility industry currently sends INPO quarterly data on 28 key performance indicators. INPO analyzes these data and provides periodic reports to its members and participants. Selected highlights of INPO's Performance Indicators for the US Nuclear Utility, dated June 1986, are discussed. Throughout 1985, INPO interacted with members, participants, and three external ad hoc review groups to refine the overall performance indicators and to develop background for each unit. By April 1986, each utility had developed long-term goals for each unit. By April 1986, each utility had developed long-term goals for most of the overall indicators. These goals represent a commitment to achievement of excellence when applied to the day-to-day conduct of plant operations, and provide a framework for action.

15788 **Startup range neutron monitor period-based transient monitor.** Chao, F.C.; Rowe, W.S. (General Electric Co., San Jose, CA). *Transactions of the American Nuclear Society;* 53: 440-441(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Current boiling water reactors use an intermediate-range neutron monitor (IRM) that covers neutron flux monitoring from $\sim 10^8$ to 10^{13} n/cm^2 s during reactor startup. This IRM provides multiple level ranges to cover the many decades of flux increase through manual up-range by the operator. Abnormal flux excursion transients are protected against by upscale trips (for both rod block and scram) on each range. The IRMs thus place high demand on operator action to avoid scram trip caused by normal flux increase. This new design was developed to substitute the IRM range switches to simplify plant operation and to improve plant availability. This design utilizes a linear amplifier and an RC-type filter. The neutron flux signal is led to pass through this amplifier/filter circuit, with the output compared to the original flux. The RC value and the amplifier gain can be so chosen and coordinated to correlate to a specific stable reactor period, designated as the setpoint.

15789 **Algorithms for the solution of the mixture drift-flux equations on multi-CPU vector pipeline machines.** Sills, E.D.; Doster, J.M. (North Carolina State Univ., Raleigh). *Transactions of the American Nuclear Society;* 53: 258-260(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Current codes used for best-estimate reactor thermal-hydraulic analysis such as transient reactor analysis code (TRAC) and RELAP require long run times on large mainframe computers. The run times have been reduced using vectorized versions on supercomputers and parallelized versions on multi-CPU machines. However, these efforts have dealt with modifying the present algorithms to run on the new architectures rather than developing new specialized algorithms. In particular, the numerical solution of equations governing heat transfer and fluid flow in reactor systems involves the solution of large sparse matrix equations. The work being presented here involves the development and evaluation of algorithms to solve these large sparse matrix equations on parallel and vector machines. The objective of this work is to solve the matrix equations rapidly enough so that the reactor system simulation will run in real, or better than real time. With this real-time simulation ability using state-of-the-art thermal-hydraulics codes the models used in training simulators could be upgraded, complex reactor system design and analysis could be performed interactively on engineering workstations, and the run times required for licensing calculations could be significantly reduced. A three-equation drift-flux code named FLOC was written for use in evaluating algorithm performance.

15790 **LWR system simulation and transient analysis package on the Oregon State cyber-VE.** Greek, K.; Anghaie, S. (Oregon State Univ., Corvallis). *Transactions of the American Nuclear Society;* 53: 51-52(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the fall of 1985, the Control Data Corporation (CDC) awarded the OSU College of Engineering with a CDC 180/810 mainframe. The CDC 810 features an extremely large user-available address space (up to 2^{43} bytes) for each task, a new and versatile operating system (NOS/VE), and a dual state function that allows concurrent execution of NOS/VE and NOS/170 operating systems. Management of this facility ensures time and capability dedicated to the largest engineering codes. Modified from the latest CDC 7600 or Cray coding, the following nuclear power plant advanced simulation codes were selected for implementation due to their wide acceptance and specialization: RAMONA-3B, COBRA/TRAC, VIPRE. Benchmarking the 810 codes above against cases performed in FORTRAN IV demonstrated the conversion effort had been a success. Today, the OSU nuclear engineering department is the largest user of the 810 among all engineering departments at OSU. The current and projected demand on resources has prompted CDC to consider upgrading the 810 to an 830 system and to provide unlimited access to parallel processing.

15791 **Thermal-hydraulic issues in nuclear training.** Burchill, W.E.; Yackle, T.R. (Combustion Engineering, Inc.). *Transactions of the American Nuclear Society;* 53: 56-57(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Thermal-hydraulic phenomena that occur in liquid-cooled nuclear power reactors are a dominant subject addressed by nuclear training programs. The most dramatic illustration of the importance of this training, or conversely the consequences of its absence, was

the Three Mile Island accident. During that accident, many personnel, including plant operators and engineers failed to recognize the thermal-hydraulic phenomena that were taking place in the reactor coolant system. This failure can be largely attributed to inadequate training of all personnel in several fundamental thermal-hydraulic phenomena and their importance in a pressurized water reactor (PWR) coolant system. This paper addresses two major areas of consideration: (a) thermal-hydraulic phenomena which must be understood by various personnel in order to operate a nuclear power plant, and (b) thermal-hydraulic modeling, which must be included in real-time simulators used to train personnel. The degree of analytical sophistication involved in each of these training areas is strongly dependent on the training objective and the trainee group that is involved. All training applications, however, require that the symptoms of numerous thermal-hydraulic phenomena be understood.

15792 **Abnormal transients in nuclear power plants, Atlanta, Georgia, April 12-15, 1987.** Sheron, B.W. (Nuclear Regulatory Commission, Washington, DC). *Transactions of the American Nuclear Society;* **53**: 57(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Research on the thermal-hydraulic performance of light water nuclear reactors in the US has been performed by both industry and government since commercial nuclear power first began. The purpose of this paper is to examine the history of thermal-hydraulic research in terms of changing regulatory needs, assess the current status of thermal-hydraulic knowledge and information deficiencies, and discuss those areas where future thermal-hydraulic testing will most likely be needed from a regulatory perspective.

15793 **Countercurrent flow and flooding with abrupt area changes.** Salim, T.; Yeung, W.S. *Transactions of the American Nuclear Society;* **53**: 535-537(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper presents a model and results for countercurrent flow through straight-tube and abrupt-area-change geometries. The model is reduced for the special case of flooding at the latter geometry and compared to data. Applications to light water reactor thermalhydraulics are noted.

15794 **Prediction of transient axial power distribution for calculation of the DNBR limit.** Samuels, J.N.; Anghaie, S. (Oregon State Univ., Corvallis). *Transactions of the American Nuclear Society;* **53**: 546-547(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Thermal-hydraulic margins are key determinants of plant operating flexibility and maximum attainable power rating, and can therefore impact on plant availability and capacity factor. Operating limits are established to ensure acceptable fuel conditions under normal operations as well as during abnormal operational transients or accident events. Examples of parameters that are limited to achieve these ends are linear heat generation rate, departure from nucleate boiling ratio (DNBR) in pressurized water reactors, and minimum critical power ratio in boiling water reactors. A region-wise point reactor kinetics (RWPRK) model has been incorporated into the COBRA-IV code which allows the axial power profile to vary during the transient event according to local thermal-hydraulic conditions and reactivity coefficients. The RWPRK model, a nodal model with the coupling coefficients set to zero, has been compared to other kinetics models by Lin et al. The results of this comparison indicate that the model can be employed under a variety of operational and accident conditions, and show that the result of calculations obtained by using this model are better than those obtained by using a single point reactor kinetics model and comparable to the results obtained using a one-dimensional space-time-dependent diffusion model.

15795 **Dual loop jet pump model for BWR stability analysis.** Peng, S.J.; Podowski, M.Z.; Lahey, R.T. Jr. (Middle South Services, New Orleans, LA). *Transactions of the American Nuclear Society;* **53**: 549-551(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Most of the existing computer codes for the stability analysis of boiling systems in general, and boiling water nuclear reactors (BWRs) in particular, employ a single-loop model in which the heater is treated as a single channel. Such an approach is sufficient as long as these codes are used to investigate the stability of rather simple experimental facilities equipped with a single electrically heated channel and a single recirculation pump. In the case of BWRs, however, more sophisticated models are necessary to properly model a multibundle core combined with a two-loop recirculation system. A new dual-loop model of the BWR recirculation system has been developed. The purpose of this paper is to present this model, in which two recirculation loops are considered individually, each consisting of a recirculation pump and bank of identical jet pumps. The dual-loop jet pump model has been developed and has been used to improve the modeling in NUFREQ-NP. The resulting code, NUFREQ-NP MOD.1, has been extensively tested and verified against the experimental data of the Peach Bottom-2 stability tests. Among others, the following conclusions can be drawn from the results: 1. The operation mode of recirculation pumps noticeably affects stability. 2. Dual-loop operating conditions are more stable than single-loop operation; also, symmetric operation is more stable than asymmetric operation.

15796 **Water reactor fuel element performance computer modelling.** Gittus, J. New York, NY; Elsevier Science Pub. Co. Inc. (1983). 703p. Elsevier Science Pub. Co. Inc., 52 Vanderbilt Ave., New York, NY New York, NY.

This book presents papers on the computerized simulation of fuel elements in water cooled reactors. Topics considered include fission product release, fuel rod irradiation, the creep deformation of Zircaloy 4, fuel pellet fracture, the mechanical properties of uranium dioxide, friction, computer codes, fuel pins, fuel-cladding interactions, loss of coolant accidents, fuel sheath oxidation, fuel rod behavior predictions, and fuel bundle analysis codes.

15797 **(CONF-8611109—5) Characteristics of corrosion behaviour of Zr 1% Nb WWER fuel claddings within 700 to 1000°C on long-term exposures.** Solyany, V.I.; Bibilashvili, Yu.K.; Dranenko, V.V.; Izrailevsky, L.B.; Levin, A.Ya.; Morozov, A.A. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Neorganicheskikh Materialov, Moscow (USSR); Vsesoyuznyj Nauchno-Issledovatel'skij Teplotekhnicheskij Inst., Moscow (USSR)). Nov 1986. 15p. NTIS (US Sales Only), PC A02. File Number DE87900497.

From IAEA technical committee meeting on water reactor fuel behaviour and fission products release in off-normal and accident conditions; Vienna, Austria (10 Nov 1986).

Under accident conditions at NPP corrosive interaction between fuel clads and water steam can proceed rather intensively and significantly affect the safety and after-accident dismantling of a reactor core. In the USSR extensive studies have been performed into the corrosion behavior of Zr1%Nb WWER fuel clads in steam at 700 to 1500°C and exposure time 5 to 600 min. The data obtained are a basis for design modeling and estimates of the feasibility of the safety criteria. In the course of the program some features of the oxidation kinetics have been established that can influence the results of those estimates. This paper discusses one of the effects found in the course of the investigations, viz., multiple transitions on the weight gain curve for a high temperature corrosion of Zr1%Nb alloy.

15798 **(EDF-DER-RA—1985-1) DER 85: main facts.** (Electricite de France, 75 - Paris). 1986. 196p. (In French). NTIS (US Sales Only), PC A09/MF A01. File Number DE87750539.

This report presents the important facts among the studies carried out by the "Direction des Etudes et Recherches" (E.D.F.): new applications of electric power for customers, protection of environment, classical equipments for power plants and nuclear equipments, monitoring and control of power plants, electrical equipments, development and operation of electrical networks, informatics and office automation.

15799 **(EPRI-NP—5015) Hideout and return of chloride salts in heated crevices prototypic of support plates in steam generators: Topical report.** Mann, G.M.W.; Castle, R. (Central Electricity Research Labs., Leatherhead (UK); Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. 81p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920244.

Solutions of NaCl (7 μg/kg - 70 mg/kg Cl) were pumped into an autoclave at 280°C and boiled in an annular crevice 50% filled with carbon fiber. The weight of NaCl concentrated in the crevice was monitored from the increase in salt concentration at the autoclave outlet after switching off the crevice heater. Salt accumulated initially in the crevice at a constant rate given by the product of the bulk concentration and the evaporation rate. Hideout continued until an equilibrium weight of salt was reached. The equilibrium weight depended primarily on the superheat in the crevice and weakly on the bulk concentration. On reducing power or bulk concentration, salt was released as long as the weight of salt in the crevice exceeded the equilibrium weight corresponding to the altered condition. Very little salt was released from the crevice during pressure changes. Subsequently the crevice was corroded using NH_4Cl solutions and some hideout tests with NaCl were repeated. The corroded crevice was less efficient at concentrating salt due to the presence of a steam blanket. A model of the concentration process was developed and applied to the tube/support plate crevice in PWR steam generators.

15800 **(GEND—058) Drop tests of the Three Mile Island knockout canister.** Box, W.D.; Aaron, W.S.; Shappert, L.B.; Childress, P.C.; Quinn, G.J.; Smith, J.V. (Oak Ridge National Lab., TN (USA)). Jan 1987. Contract AC07-76ID01570. 103p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE87005195.

A type of Three Mile Island Unit 2 (TMI-2) defueling canister, called a "knockout" canister, was subjected to a series of drop tests at the Oak Ridge National Laboratory's Drop Test Facility. These tests confirmed the structural integrity of internal fixed neutron poisons in support of a request for NRC licensing of this type of canister for the shipment of TMI-2 reactor fuel debris to the Idaho National Engineering Laboratory (INEL) for the Core Examination R & D Program. This report presents the data generated and the results obtained from a series of four drop tests that included two drops with the test assembly in the vertical position and two drops with the assembly in the horizontal position.

15801 (IAEA-TECDOC—376, pp 51-58) **Small and medium power reactors in the Soviet power-generating industry.** Veretennikov, G.A. (Ministry of Power Engineering and Electrification, Moscow, USSR). May 1986. NTIS (US Sales Only), PC A06/MF A01. File Number DE87700889. (CONF-8509366—).

From IAEA general conference on small and medium power reactors; Vienna, Austria (25 Sep 1985).

In the two decades following the introduction of industrial-scale power-generating units at the Novo Voronezh and the Beloyarsk nuclear power plants, two main lines in the development of nuclear power stations emerged in the USSR nuclear power industry, based on the use of water-cooled, water-moderated vessel-type reactors and water-cooled, graphite-moderated channel-type reactors. In 1984, Soviet nuclear power plants accounted for 9.5% of the electric power generated. Over 140,000 million kW/h were generated (a growth of 27.5% compared with 1983), which is evidence of the significant, ever-increasing role of nuclear power stations in the overall picture of the country's power production. A substantial contribution to the USSR's nuclear power generation is made by stations with reactors of small and medium size (<= 440 MW(e) gross). Reactors of the WWER type, with an output of 440 MW(e) gross are installed at the Novo Voronezh, Armenia, Rovno and Kola nuclear power plants. At the Bilibino station four low-power (EGP-6 type) are installed. The installed power utilization factors of the units of these stations are in the range of 78-90%. The main characteristics of the two types of reactors mentioned above are given. The article includes a description in broad lines of the Soviet experience in using nuclear electric power and heating plants. The rigorism of the Soviet reactor safety regulations is stressed.

15802 **(KFKI—1986-40/G) Measurement of reactivity temperature coefficient by noise method in a power reactor.** Aguilar, O. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jul 1986. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700820.

The temperature reactivity coefficient was estimated on the basis of noise measurements performed in a PWR. The magnitude of the coefficient was evaluated by relating the values of the APSD and CPSD between ex-core neutron detector signals and fuel assembly outlet thermocouple in the low frequency range. Comparison with $\delta rho/\delta T$ measurements performed in PWR by standard methods supports the validity of the results. 8 refs.; 4 figs.

15803 **(NUREG—1237) Technical specifications, Vogtle Electric Generating Plant, Unit No. 1 (Docket No. 50-424): Appendix "A" to license No. NPF-61.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). Jan 1987. 456p. NTIS, PC A20/MF A01 - GPO. File Number TI87900482.

This technical specifications report presents information concerning the Vogtle Electric Generating Plant in the following areas: safety limits and limiting safety system settings; limiting conditions for operation and surveillance requirements; design features; and administrative controls.

15804 **(NUREG—1240) Technical specifications (Docket No. 50-400): Appendix "A" to License No. NPF-63.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). Jan 1987. 470p. NTIS (US Sales Only), PC A20/MF A01 - GPO. File Number TI87900474.

This report presents specifications concerning the Shearon Harris Nuclear Power Plant in the areas of: safety limits and limiting safety system settings; limiting conditions for operation and surveillance requirements; design features; and administrative controls.

15805 **(NUREG/CR—4788) An analytical and experimental investigation of natural circulation transients in a model pressurized water reactor.** Massoud, M. (Maryland Univ., College Park (USA). Dept. of Chemical and Nuclear Engineering; Nuclear Regulatory Commission, Washington, DC (USA). Div. of Reactor Systems Safety). Jan 1987. 270p. NTIS, PC A12/MF A01 - GPO. File Number TI87900512.

Natural Circulation phenomena in a simulated PWR was investigated experimentally and analytically. The experimental investigation included determination of system characteristics as well as system response to the imposed transient under symmetric and asymmetric operations. System characteristics were used to obtain correlation for heat transfer coefficient in heat exchangers, system flow resistance, and system buoyancy heat. Asymmetric transients were imposed to study flow oscillation and possible instability. The analytical investigation encompassed development of mathematical model for single-phase, steady-state and transient natural circulation as well as modification of existing model for two-phase flow analysis of phenomena such as small break LOCA, high pressure coolant injection and pump coast down. The developed mathematical model for single-phase analysis was computer coded to simulate the imposed transients. The computer program, entitled "Symmetric and Asymmetric Analysis of Single-Phase Flow (SAS)," were employed to simulate the imposed transients. It closely emulated the

system behavior throughout the transient and subsequent steady-state. Modifications for two-phase flow analysis included addition of models for once-through steam generator and electric heater rods. Both programs are faster than real time. Off-line, they can be used for prediction and training applications while on-line they serve for simulation and signal validation. The programs can also be used to determine the sensitivity of natural circulation behavior to variation of inputs such as secondary distribution and power transients.

15806 **Low-leakage fuel management in Sequoyah.** Strange, J.E. (Tennessee Valley Authority). *Transactions of the American Nuclear Society;* 53: 84-85(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Sequoyah is a two-unit nuclear power station. Each unit is a four-loop Westinghouse pressurized water reactor with 193 fuel assemblies and a rated thermal output of 3411 MW. Unit 1 has been refueled for cycle 4 and unit 2 is in the middle of cycle 3. Both cycles employ low-leakage loading patterns. A contractual commitment made it desirable to establish the enrichment needed for unit 1, cycle 5, even though cycle 4 had not begun operation. The TVA decided to use this opportunity to determine whether further reductions in radial leakage would be desirable. Thus two goals were set for the project. The first was to determine the reload enrichment requirements for unit 1, cycle 5. The second was to reduce the radial leakage by the maximum amount without exceeding the licensing limits for local power peaking. This paper includes a description of methodology, design criteria and guidelines, results for in-out-in fuel management, and results for in-in-out fuel management. Both objectives for the project were met. Vendor calculations verified that the cycle 5 in-out-in pattern was licensable.

15807 **Extended burnup: ex-core and accident considerations.** Snow, A.L.; Thornton, J.R. (Duke Power Co., Charlotte, NC). *Transactions of the American Nuclear Society;* 53: 103(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Original design-basis cycle average burnup referenced for fuel discharged from Duke Power Company's Catawba and McGuire units in safety analysis calculations is 11 450 MWd/ton U. Due to changes in the fuel cycle that have developed since the initial design of these units, significant economic benefits can be realized by extending cycle burnup beyond 11 450 MWd/ton. These benefits include decreases spent-fuel discharge rates, increased plant capacity factors, reduced spent-fuel storage and disposal requirements, and reduced worker radiation exposures. In order to achieve the benefits of extended burnup, numerous in-core thermal-hydraulic and reactivity safety analyses must be performed and documented in a Reload Safety Evaluation Report submitted to the US Nuclear Regulatory Commission NRC. Other technical concerns associated with extending fuel discharge burnups not addressed as part of the reload reports include fuel storage capability (both fresh and spent) and safety analysis report (SAR) off-site accident dose calculation impacts. This paper describes Duke Power Company's approach in addressing these accident and ex-core concerns in support of the McGuire and Catawba extended burnup programs.

15808 **Impact of high-burnup fuel cycles on fuel storage systems.** Massey, J.V.; Thomas, B.D.; Ferguson, B.W. (Nutech, San Jose, CA). *Transactions of the American Nuclear Society;* 53: 105-108(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The utility industry's trend toward higher burnup fuel cycles [50,000 MWd/ton heavy metal (HM)] will change the design parameters used in the development of fuel storage systems. The overall significance of these changes (in terms of technology and economics) is not completely understood. The intent of this paper is to investigate the effects of increased initial enrichment and burnup on typical high density pool storage, consolidated fuel storage, and dry storage. System capacity, shielding requirements, thermal hydraulics, criticality control, and cost are addressed, as applicable. Specific systems were selected for evaluation. The pool selected holds 1500 pressurized water reactor (PWR) storage sleeves in high-density racks.

15809 **Primary side stress corrosion cracking and remedial measures.** Theus, G.J. (Babcock & Wilcox, Alliance, OH). *Transactions of the American Nuclear Society;* 53: 207-208(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Primary side stress corrosion cracking (SCC) of Alloy 600 stream generator tubing in some recirculating pressurized water reactor steam generators has usually occurred in two locations: at the roll transition and expansion locations within the tube-sheets and at the apex and tangent areas of the tight radius U bends. Occasionally, other highly stressed areas have also suffered primary side SCC: at support plate tube intersections where secondary side denting has occurred and at the steam generator tube transition areas of explosively installed mini-sleeves. Laboratory data and operating performances of Alloy 600 tubing indicate that the factors affecting the susceptibility to this type of SSC, in decreasing order of importance, are high stresses, material microstructures, and operating temperatures. Remedial measures to correct these problems in newer plants include changing design and fabrication procedures, thus avoiding highly stressed areas of tubing, and changing tube manufacturing heat treating requirements, thus improving the microstructures. Alternate tube materials, such as Alloy 800, Monel 400, or austenitic stainless steels, have not suffered this type of failure.

15810 **Steam generator vessel and feedwater line integrity issues.** Bamford, W.H. *Transactions of the American Nuclear Society;* 53: 208-209(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Pressurized water reactors have now been operating commercially for over 25 yr, and during this time much has been learned about establishing and maintaining reliable operation. One of the best examples of this progress is the steam generator. A typical steam generator is shown, a large-diameter (10-ft) thin-walled (3- to 5-in.) pressure vessel. The heat transfer from the primary loop, which circulates water through the reactor vessel, to the secondary loop, which circulates water and steam through the turbine cycle, is accomplished through a large number of thin-walled tubes made of Inconel 600 or stainless steel. The primary loop is clad with stainless steel to minimize formation of corrosion products, and the water chemistry and operation are highly standardized and tightly controlled. The design and water chemistry control of the secondary systems are not standardized and are generally the responsibility of the utility and architect engineer. Guidelines for design and chemistry control have been issued by the nuclear power plant vendors and the Electric Power Research Institute. This paper chronicles three operational issues that have occurred in the steam generator pressure boundary and discusses the improvements that were developed to help protect against future occurrence. The issues are feedwater line cracking, water hammer, and girthweld cracking of the steam generator shell.

15811 **Improved water chemistry controls for minimizing degradation of materials.** Sawochka, S.G. (NWT Corp., San Jose, CA). *Transactions of the American Nuclear Society;* 53: 209-210(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Electric Power Research Institute and the Steam Generator Owners Group have sponsored several efforts to develop secondary water chemistry guidelines to minimize pressurized water reactor (PWR) steam generator tubing degradation. To develop these guidelines, chemical species known to accelerate corrosion of Alloy 600 were identified, and values for normal and abnormal chemistry situations were established. For example, sodium hydroxide was known to accelerate Alloy 600 intergranular attack stress corrosion cracking; thus, guidelines were developed for blowdown sodium concentrations in recirculating steam generator systems. Similarly, formation of acidic solutions, particularly as a result of chloride ingress at seawater sites, was known to accelerate denting; thus, chloride guidelines were established. A blowdown cation conductivity limit was established to minir.. ze concentrations of other anionic species. Guidelines also were developed for condensate and feedwater chemistry to minimize general corrosion

of system materials, thereby minimizing sludge and deposit buildup in the steam generators.

15812 **Review of secondary side tube degradation processes in PWR steam generators.** Hall, J.F. (Combustion Engineering, Inc., Chicago, IL). *Transactions of the American Nuclear Society;* 53: 210-211(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The NiCrFe Alloy 600 is the pressurized water reactor (PWR) steam generator tube material used in essentially all US PWRs, in most foreign PWRs, and thus is the tube material with the greatest service experience. Numerous laboratory investigations and service experience have demonstrated that Alloy 600 has good corrosion resistance in the steam generator secondary side environments expected under normal operating conditions. Experience in the laboratory and in the field, however, has demonstrated that even low levels of contaminants may concentrate in tubesheet crevices, in deep tubesheet sludge piles, and in tube support structure crevices to levels that promote several types of corrosion [pitting, intergranular attack, stress corrosion cracking, wastage] of the tube material. Low levels of contaminants, such as chlorides, sulfates, and oxygen, in the secondary system result from condenser cooling water and air in-leakage and from impurity releases from condensate polishers. This discussion reviews the corrosion-related secondary side tube degradation processes that have affected steam generator tubes in recent years and also mechanical tube damage resulting from fatigue and wear of the tube material.

15813 **Understanding and protecting steam generator materials.** Ballinger, R.G. (Massachusetts Institute of Technology, Cambridge). *Transactions of the American Nuclear Society;* 53: 211(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Solid solution-strengthened nickel base alloys have been used for nuclear stream generator tubing in pressurized water reactors since the beginnings of commercial nuclear power. The purpose of this paper is to recap and update the authors understanding of the relationship between processing, resulting structure, and properties for Alloy 600 and to discuss the requirements for optimized performance in both primary and secondary environments. Potential replacement materials and their performance will be discussed. Also discussed is the role and importance of system chemistry, bulk and local, and control and its relationship to performance. A discussion of potential mechanisms of environmentally assisted failure is also discussed.

15814 **O/M ratio measurements of $(U,Gd)O_2$ solid solutions by gravimetry.** Yato, T.; Hagino, S.; Kawashima, Y.; Kamei, Y.; Honda, Y. (Mitsubishi Metal Corp.). *Transactions of the American Nuclear Society;* 53: 218-219(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Fuel of UO_2 containing a high content of gadolinia is planned to be used in pressurized water reactor high-burnup fuels. The UO_2-Gd_2O_3 fuel is in the state of solid solution in which a part of the uranium atoms in UO_2 are substituted by gadolinium atoms. The oxygen-to-metal (O/M) ratio of the solid solution is one of the most important factors affecting fuel properties and irradiation performance. The M represents metals of uranium and gadolinium. The oxygen-to-uranium O/U ratio of UO_2 fuel is usually measured by gravimetric analysis during oxidation of UO_2 to U_3O_8. In contrast with UO_2, it is difficult to measure the O/M ratio of $(U,Gd)O_2$ solid solution by gravimetry, because it is not clear whether the oxidation product of the solid solution is U_3O_8-Gd_2O_3 mixture, $(U,Gd)_3O_8$, or others. In this study, the measuring method of the O/M ratio of the solid solution by gravimetry has been developed and evaluated by examining oxidation behavior and oxidation products of the solid solution.

15815 **Pin Power prediction in the Westinghouse Advanced Nodal Code.** Liu, Y.S.; Meliksetian, A.; Casadei, A.L. *Transactions of the American Nuclear Society;* 53: 246-247(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Westinghouse has employed a nodal code, PALADON, for core design for many years. The code has been used in conjunction with a fine-mesh finite difference code to provide benchmarking of power distribution and, if necessary, a basis for albedo adjustments. An Advanced Nodal Code (ANC) has been developed employing the nodal expansion method for nodal coupling coefficients, the equivalence theory for cross-section homogenization, and a group theory method for pin power recovery. This methodology enables the use of a single three-dimensional core model for all design applications and eliminates the need for development of redundant core models for benchmarking and albedo adjustment. A key factor to the success of the ANC is its accurate and efficient prediction of the local pin power and thimble flux.

15816 **Method of baffle/reflector region homogenization.** Rathkopf, J.A.; Liu, Y.S. *Transactions of the American Nuclear Society;* 53: 247-249(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Albedo boundary conditions are commonly used in coarse-mesh nodal codes as a substitute for the baffle and reflector, thereby reducing the size of the problem and the corresponding computational expense. Analytical expressions for one-dimensional albedos are easily obtained, but, in the case of two-dimensions, more complicated models are used with limited success. The Westinghouse Advanced Nodal Code (ANC) allows representation of the baffle and reflector region by homogeneous nodes beyond the fuel assemblies. This summary describes a procedure developed to obtain baffle/reflector constants that will reproduce the results of fine-mesh diffusion theory analysis of cores with explicitly modeled baffles and reflectors. The method does not attempt to reproduce transport effects - the emphasis of other recent work. These homogenized baffle/reflector constants, which incorporate the discontinuity factor of Koebke's equivalence theory of homogenization, have been applied to nodal calculations with great success.

15817 **Improvement in steam generator level control.** Masuda, J.; Ohtake, M.; Haneda, T. (Mitsubishi Atomic Power Industries, Inc., Tokyo, Japan). *Transactions of the American Nuclear Society;* 53: 376-377(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Statistics of the scram events of Japanese pressurized water reactor (PWR) plants show that unnecessary scrams due to failures in the steam generator feedwater system contribute about one-fourth of the total scrams. To reduce scram frequency due to those failures, measures have been taken for operating plants as well as new plants. Expansion of automation in steam generator water level control is one of the measures, since the failure of the feedwater control at lower power, mostly on manual control, contributed about 40% of total unnecessary scrams due to feedwater system failures. This paper discusses the improvements that have been made, especially automation of steam generator water level control for Japanese PWR plants.

15818 **Evaluation of feedwater systems for reactor scram reduction.** Knell, K.C.; Hanley, N.E.; Banerjee, A.K. (Stone & Webster Engineering Corp., Boston, MA). *Transactions of the American Nuclear Society;* 53: 377-378(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Deficiencies in the feedwater and condensate system were identified as the cause or contributor to 28% of all reactor scrams in 1985. A number of options are currently available to enable nuclear utilities to increase plant availability and reliability through a reduction in reactor scrams and by limiting secondary plant transients that challenge safety systems. Options for identifying areas of improvement include performing precise engineering evaluations of feedwater pumps, control systems, control system upgrades, and performing transient analysis. This paper outlines and describes three areas the nuclear industry can pursue to evaluate the feedwater system for improved plant performance and a reduction in

reactor scrams. Problem areas in the secondary plant with the potential to cause reactor scrams include misoperation of feedwater components and instrumentation, as well as secondary system transients resulting from condensate and condenser system failures.

15819 **Palo Verde full-range feedwater control system operating experience.** Singh, G.; Elimar, R. (Combustion Engineering, Inc.). *Transactions of the American Nuclear Society;* 53: 378-380(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

High and low steam generator level trips are significant contributors to plant unavailability during low-power operation. This is caused by the destabilizing characteristics of the steam generation process and the lack of accurate steam flow and feed flow indications. The process is further complicated by simultaneous change of plant parameters like steam flow and primary power which affect the steam generators' response. To eliminate this problem, the Arizona Public Services' Palo Verde Nuclear Power Station has installed Combustion Engineering's Full-Range Feedwater Control System. This system has been designed to automatically control steam generator level at low powers, high powers, during feedwater valve transfers, and during the post-trip steam generator refill mode. The control system has passed all acceptance tests during startup warranty tests and is currently in commercial operation at Palo Verde Unit 1. Operating experience with the system in automatic has allowed operation of Unit 1 during 1985 without any reactor trips associated with steam generator level control. This has contributed to scram reduction and improvement of plant availability. The operating experience associated with the system is outlined in this paper.

15820 **Bechtel automated control of design document data.** Hollingshaus, H. *Transactions of the American Nuclear Society;* 53: 384(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Concern for nuclear power plant safety has resulted in many design features that complicate the licensing, operation, and maintenance of nuclear plants. To manage and control the design effectively, Bechtel has developed an integrated design document data base that provides efficient support of the plant during all phases of its life. The program runs on the IBM System 38, but can also be downloaded to an IBM PC to save storage and connect time. It is interactive and can accommodate multiple users at various locations. Although primarily developed to manage design changes resulting from the regulatory process and use of a fast track construction schedule, the data base will provide operations and maintenance personnel with qualifications status and pertinent data for each piece of equipment, including all electrical devices and a list of all associated design documents.

15821 **Baseline characterization of electrical circuits to support plant life extension.** Phelps, R.L. Jr.; Wells, K.P.; Dinsel, M.R.; Quinn, E.L. Jr.; Meininger, R.D. (Southern California Edison Co.). *Transactions of the American Nuclear Society;* 53: 395-396(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

To (a) provide data on the relative condition of certain electrical cable in use on one of its nuclear plants, and (b) gain experience with state-of-the-art equipment and procedures for obtaining these data under the US Department of Energy (DOE) technology transfer to industry program, Southern California Edison Company (SCE) performed a program in association with EG & G Idaho, Inc., at the San Onofre Nuclear Generating Station (SONGS), Unit 1 during the Cycle IX Refueling Outage in April and May 1986. The program obtained baseline data for characterization of electrical circuits utilizing the Electrical Circuit Characterization and Diagnostic (ECCAD) System, developed by EG & G Idaho, Inc. under contract to the DOE. The ECCAD system and the SONGS 1 program to utilize it are described to show a method for characterizing electrical circuits by comparison to baseline data or to data from similar circuits. This demonstrates a capability to identify the effects of environment and aging on electrical circuits. This technique was shown to have both short-term (diagnostic) potential and long-term (characterizing aging effects) potential for use in applications where electrical circuits may be subjected to environmental conditions that can lead to cable degradation.

15822 **Fast neutron fluxes in pressure vessels using Monte Carlo methods.** Edlund, M.C.; Thomas, J.R. (Virginia Polytechnic Institute and State Univ., Blacksburg). *Transactions of the American Nuclear Society;* 53: 396-397(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The objective of this project is to determine the feasibility of calculating the fast neutron flux in the pressure vessel of a pressurized water reactor by Monte Carlo methods. Neutron reactions reduce the ductility of the steel and thus limit the useful life of this important reactor component. This work was performed for Virginia Power (VEPCO). VIM is a continuous-energy Monte Carlo code which provides a versatile geometrical capability and a neutron physics data base closely representing the EDNF/B-IV data from which it was derived.

15823 **Vibration monitoring/diagnostic techniques, as applied to reactor coolant pumps.** Sculthorpe, B.R.; Johnson, K.M. (Florida Power & Light Co., Ft. Pierce). *Transactions of the American Nuclear Society;* 53: 397-398(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

With the increased awareness of reactor coolant pump (RCP) cracked shafts, brought about by the catastrophic shaft failure at Crystal River #3, Florida Power & Light Company, in conjunction with Bently Nevada Corporation, undertook a test program at St. Lucie Nuclear Unit #2, to confirm the integrity of all four RCP pump shafts. Reactor coolant pumps play a major roll in the operation of nuclear-powered generation facilities. The time required to disassemble and physically inspect a single RCP shaft would be lengthy, monetarily costly to the utility and its customers, and cause possible unnecessary man-rem exposure to plant personnel. When properly applied, vibration instrumentation can increase unit availability/reliability, as well as provide enhanced diagnostic capability. This paper reviews monitoring benefits and diagnostic techniques applicable to RCPs/motor drives.

15824 **Plant experience with temporary reverse osmosis makeup water systems.** Polidoroff, C. (Pacific Gas & Light). *Transactions of the American Nuclear Society;* 53: 402(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Pacific Gas and Electric (PG & E) Company's Diablo Canyon Power Plant (DCPP), which is located on California's central coast, has access to three sources of raw water: creek water, well water, and seawater. Creek and well water are DCPP's primary sources of raw water; however, because their supply is limited, these sources are supplemented with seawater. The purpose of this paper is to discuss the temporary, rental, reverse osmosis systems used by PG & E to process DCPP's raw water into water suitable for plant makeup. This paper addresses the following issues: the selection of reverse osmosis over alternative water processing technologies; the decision to use vendor-operated temporary, rental, reverse osmosis equipment versus permanent PG & E-owned and -operated equipment; the performance of DCPP's rental reverse osmosis systems; and, the lessons learned from DCPP's reverse osmosis system rental experience that might be useful to other plants considering renting similar equipment.

15825 **Secondary-side chemical cleaning of Oconee nuclear station steam generators.** Snow, A.L. (Duke Power Co., Charlottesville, NC). *Transactions of the American Nuclear Society;* 53: 403-404(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

From as early as 1977, the Oconee Unit 1 once-through steam generators (OTSGs) have experienced tube defects traceable to the presence of magnetite (Fe_3O_4) debris lying primarily on the tube support plates. Likewise, the Oconee Unit 2 steam generators began to experience an increase in pressure drop in 1982, also at-

tributable to secondary-side magnetite deposits. The chemical cleaning system serves to mix and heat the cleaning, rinse and passivation solutions, and then inject and circulate the solutions in the steam generator. Next, the solutions are drained and transferred to temporary waste storage tanks.

15826 **Neutron and gamma-ray flux calculations for the VENUS PWR engineering mockup.** Fero, A.H. (Westinghouse NTSD). *Transactions of the American Nuclear Society;* 53: 405-408(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper describes the analysis of neutron and gamma-ray fluxes in the VENUS pressurized water reactor (PWR) engineering mockup benchmark experiment (SCK/CEN Mol, Belgium). This mockup is unique in two ways. It is the first mockup to correctly represent the heterogeneities which exist in the PWR core peripheral fuel assemblies, core baffle, core barrel, and neutron pad. This is accomplished by using low-enrichment (3.3 and 4.0 wt% ^{235}U) fuel pins and a representative PWR fuel assembly geometry (15 x 15) with full thickness Type 304 stainless steel reactor internals structures located with representative water gap spacing. The VENUS mockup also represents locally the stairstep geometry of the core periphery. Second, the VENUS mockup is extremely well characterized in terms of as-built dimensions, material compositions, and pin-by-pin core power distributions. Analysis of VENUS was performed using the methods and procedures used to analyze commercial PWRs. Specifically, two-dimensional discrete-ordinates transport theory calculations were performed using the DOT-IIIW code.

15827 **Calculations for determining appropriate key radionuclides for failed fuel analysis.** Harris, R.D.; Binney, S.E. (Oregon State Univ., Corvallis). *Transactions of the American Nuclear Society;* 53: 429-430(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The US Nuclear Regulatory Commission requires that a group of key radionuclides that may be indicative of the extent of core damage be analyzed under abnormal core conditions. However, establishing this group of radionuclides is left to the discretion of the licensee. The purpose of this work was to evaluate the effectiveness of the key radionuclide concept and to determine if this type of analysis would aid the licensee in establishing this group of key radionuclides. A design-basis accident in a pressurized water reactor (PWR) was chosen for this evaluation. This study has shown that an appropriately selected group of key radionuclides can provide information on the state of the reactor core during and after an accident situation. The method used could aid the licensee of a nuclear power plant in the selection of key radionuclides. The pertinent factors in key radionuclide selection are the background count rate, the interference-free photopeak energy resolution, the minimum count time required for detection, and the necessary count rate reduction factor.

15828 **Search of excellence: the problems of material aging and reliability in an older nuclear unit at the Southern California Edison company.** Ray, H.B. (Southern California Edison Co., San Clemente). *Transactions of the American Nuclear Society;* 53: 435-437(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Southern California Edison Company (SCE) is the majority owner and the operator of the three-unit San Onofre Nuclear Generating Station (SONGS) located on the Pacific coast between Los Angeles and San Diego. Its major goals for SONGS are reflected in the motto, Safety, Compliance and Excellence, which follow the company initials, SCE. The goal of excellence in unit operations includes the need to ensure that incidents that challenge plant safety systems do not occur. On November 21, 1985, an incident occurred at San Onofre Unit 1 which involved two separate material condition deficiencies. This incident represented a challenge to plant safety systems which was avoidable, but which had not been prevented by the authors existing programs for monitoring plant material condition. With input and suggestions from the US Nuclear Regulatory Commission (NRC) regional management, SCE developed and implemented two programs that are intended to achieve specific goals for reestablishing and systematically maintaining the material condition throughout the plant in safety-related and in nonsafety-related areas at a standard which will maintain for the next 20 yr the record of safe operation of San Onofre Unit 1 which it has accumulated in its first almost 20 yr.

15829 **PC-based flux mapping data collection system.** Fahley, J.M. (Pacific Gas and Electric, Avila, Spain). *Transactions of the American Nuclear Society;* 53: 443(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Diablo Canyon Power Plant if owned and operated by Pacific Gas and Electric Company of California. The plant consists of two Westinghouse design pressurized water reactors (PWRs). Unit 1 began commercial operation in May 1985, Unit 2 in March 1986. Many personal computer (PC)-based engineering applications have been developed at the site to perform calculations required by plant operations and surveillance testing. This paper addresses the development and implementation of a PC-based system which collects and transmits data for meeting Technical Specification surveillance requirements on reactor core conditions.

15830 **Use of the DSNP simulation language in high-seed dynamic simulation of nuclear power plants.** Yeh, H.C.; Kastenberg, W.E.; Catton, I. (Univ. of California, Los Angeles). *Transactions of the American Nuclear Society;* 53: 46-48(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper focuses on two possible DSNP applications in high-speed dynamic simulation of nuclear power plants. Because of the high-level language drawback, it is not designed for high-speed simulation purposes, which was stated very clearly in its development objective. To overcome this shortcoming by using parallel processing, and considering the advantages of a high-level reactor simulation language and the supporting language for the array processor, it will be profitable to use DSNP to generate backbone FORTRAN programs and then to tailor the FORTRAN programs to accommodate the calling program to the array processor. The preliminary results of this approach are shown. Another possible way of exploring the features of SEASNET with the application of DSNP is to (a) prepare the DSNP source program on a PC/AT or PC/RT (more preferable); (b) compile, link, and execute on the server machine, IBM 4381 or FPS-164; and (c) receive the computing results and display graphically with the aid of a graphics package running on a PC/AT or PC/RT. The dynamics of a preasurized water reactor (PWR) nuclear power plant are simulated.

15831 **U-tube steam generator model for the DSNP language.** Welch, G.E.; Dugan, E.T.; Vernetson, W.G. (Univ. of Florida, Gainesville). *Transactions of the American Nuclear Society;* 53: 49-50(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A U-tube steam generator (UTSG) model has been developed for the dynamic simulator for nuclear power plants (DSNP). The model is designed to predict the behavior of UTSG variables during transients that are at least as severe as those which may be anticipated during normal power plant operation, while maintaining those features that make DSNP an attractive method for transient simulation in the university environment. The relatively simple models currently available in the DSNP code package are suited to predicting the tendency of global power plant parameters economically, both in computer execution time and man-hour investment per simulation.

15832 **Sound measures feedwater temperature within 1°F consistently.** Imai, M.; Bistrian, J.; Erickson, G. (Consolidated Edison Co. of New York, NY). *Transactions of the American Nuclear Society;* 53: 523-524(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The speed of sound can be used to measure the temperature of feedwater in a power plant. This method is accurate and can be

better than thermocouples (T/Cs) or resistance temperature detectors (RTDs). It can measure to an accuracy of +/- 1.0°F, is very reliable, and has demonstrated that drift is far less than existing RTDs. Sonic temperature should be used for plant calorimetrics. One advantage of using the speed of sound in water to measure temperature is that the same instrument, the ultrasonic leading edge flowmeter (LEFM), can be used to measure both feedwater flow and temperature. Since the LEFM was first installed at Indian Point Unit 2 in 1979, it has been used to measure feedwater flow. Drift problems seen in RTDs or T/Cs have not been exhibited by the LEFM. Data obtained during a plant startup were used to generate the temperature-velocity relationships and additional data were obtained over two months to demonstrate the reliability of this new method to obtain feedwater temperature. Excellent accuracy, reliability, and repeatability of this method have been demonstrated by this study.

15833 **Calculation of once-through steam generator performance using RELAP5/MOD2.** Nithianandan, C.K. (Babcock & Wilcox Engineering Corp., Boston, MA). *Transactions of the American Nuclear Society;* **53**: 524-526(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Three steam generator performance tests from the Babcock & Wilcox (B & W) 19-tube, once-through steam generator (OTSG) test facility were simulated using RELAP5/MOD2 - cycle 36.10, and the results were compared with the experimental data. RELAP5 predicted the steam generator steady-state performance reasonably well. However, further refinements to the boiling and the post-critical heat flux (CHF) heat transfer would improve the capability to correctly predict OTSG behavior.

15834 **Turbulence force correlation of PWR steam generator tube bundle flow.** Hu, M.H.; Alemberti, A. *Transactions of the American Nuclear Society;* **53**: 543-544(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Westinghouse Model D4 steam generator uses a counterflow preheater in the lower bundle. A 2/3-scale test model simulated the full 180 deg of the first pass of the preheater, including the feedwater nozzle, water box, Plates, A, B, and D and the vertical partition plate. The test model consists of the full complement of 4578 straight tubes in the cold-leg side of the steam generator, they are of square pitch, and 49 tube rows by 114 tube columns. The tube outside diameter is 0.5 in. with a tube pitch of 0.7083 in. The 2/3-scale model is part of a program to modify counterflow preheat steam generators to reduce flow-induced vibration and wear level in the preheater.

15835 **Streamlined one-pass modelling.** Jones, J.H.; Harne, R.L.; Firth, K.J.; Meyer, G.A. (Babcock & Wilcox Engineering Corp., Boston, MA). *Transactions of the American Nuclear Society;* **53**: 545-546(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Streamlined one-pass models provide an alternative to the standard type of one-pass models for departure from nucleate boiling ratio (DNBR) studies, which require a large number of computer simulations. The standard one-pass models simulate the limiting subchannel (subchannel in which minimum DNBR occurs), a ring of subchannels around the limiting subchannel, the remainder of the limiting bundle, and the remainder of the core. Typically, these standard models use from 8 to 12 channels and ~20 cross-flow gaps. Babcock & Wilcox (B & W) has developed streamlined one-pass models that require approximately one-half the number of channels and ~20% of the computer resources as the standard one-pass models. These streamlined models are applicable in one-pass analysis codes such as the B & W code LYNXT and the Electric Power Research Institute VIPRE code. Streamlined one-pass models are particularly suited to extensive studies wherein computer cost and turnaround are critical, without sacrificing DNBR accuracy. Examples of such studies are reactor protection operating limit determination, limiting transient selection, and scoping studies. Moreover, streamlined one-pass models make it possible to perform DNBR studies on personal computers (PCs) using PC-adapted codes such as COBRAPC.

15836 **(IAE—4067/4) Experimental investigation of closed-type convective thermosyphon thermal performance as applied to a molten salt power reactor.** Ignat'ev, V.V.; Kersnovskij, S.V.; Novikov, V.N.; Smirnov, Yu.B.; Surenko, V.I.; Shcherbanyuk, O.P. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1984. 33p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700702.

The technique for studying integral thermal characteristics of a closed thermosyphon (CT) using a model fluid (distilled water) permitting to determine peculiarities and possibilities of CT as applied to a molten salt power reactors are suggested. Regularities of heat exchange in vertical and inclinated thermosyphon are considered. Dependences to determine heat exchange efficiency are obtained. It is pointed out that vertical thermosyphons can transfer thermal power of > 100 kW at the average difference in temperatures of internal surface of thermosyphon wall in heating and cooling zone equal to 200 deg C. 15 refs.; 12 figs.; 6 tabs.

15837 **(BARC—1295) BOXER3: a three dimensional integral transport code for PHWR supercell.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 38p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701260.

This report describes BOXER3, three dimensional computer code for solving the integral transport equation. The code uses a combination of the collision probability and the interface current methods. It uses mixed rectangular and cylinderical coordinates and can therefore treat cylindrical fuel channels and reactivity devices within a rectangular 'supercell' of a Candu PHWR. The report describes the details of computation of collision probabilities and the solution of the neutron balance equations. The latter can be done iteratively or by direct matrix inversion. It is shown that the iteration scheme is convergent. Comparisons of the results of BOXER3 and those obtained by other transport and diffusion codes in one, two and three dimensional geometries are also presented. 12 refs., 7 tables, 5 figures.

15838 (EPRI-CS—4748, pp 1.1-1.18) **Rotating equipment vibration monitoring and diagnosis experience at CANDU nuclear power plants.** Loewen, T.; Perricone, F. (Ontario Hydro, Toronto). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

This paper describes rotating equipment vibration monitoring and analysis systems used in Ontario Hydro Nuclear Plants. The approaches to monitoring vary from periodic manual methods with portable equipment to on-line computer managed systems. The main function of the monitoring systems is the detection and diagnosis of rotating equipment defects at an early stage. The main objective is to provide information to plant personnel for maintenance planning and assessment, resulting in substantial savings in maintenance costs, improved equipment reliability, and reduced maintenance personnel exposure to radiation. Also, case histories are presented to illustrate the application of vibration monitoring methods and their effectiveness. 3 references, 6 figures.

15839 (IAEA-TECDOC—378, pp 165-175) **Financial risk assessment for nuclear generation expansion planning. A utility view.** Titus, G.L. (New Brunswick Electric Power Commission, Fredericton, Canada). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

In this paper the author gives a utility view of the nuclear generation expansion planning and financial risk assessment done by the New Brunswick Electric Power Commission in order to enter the nuclear power generation age, when its first reactor became critical (July 25, 1982). The system development philosophy, as well as the economic, technical, and environmental considerations of New Brunswick Power are mentioned. The risk/benefit optimization and the unit as such are described. The conclusions for future expansion planning are drawn. 2 figs, 1 tab.

15840 **Search for excellence - goal setting, Ontario Hydro Nuclear Generation experience.** Niitenberg, A.; Andersen, W.J. (Ontario Hydro, Canada). *Transactions of the American Nuclear Society;* **53**: 432-433(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Ontario Hydro, a provincial government-owned utility which supplies electrical energy to the province of Ontario provides over 40% of the total generation from nuclear units. Much of its success in operating nuclear generating stations is attributed to the use of a highly developed, well-proven Management by Objectives program. This program is based on a systematic approach involving establishment of objectives, measurement of results, identification and resolution of problems, and continuous feedback of operating experience to designers, manufacturers, and researchers. The established objectives are as follows: 1) worker safety objectives; 2) public safety objectives; 3) environmental protection objectives; 4) reliability objective; and 5) product cost objective. Wherever practical, the above objectives have been quantified as standards and targets. Quantified standards are defined to help in assessing the Ontario Hydro performance compared with relevant performance outside of Ontario Hydro. Quantified targets are defined to help put a handle on the effectiveness of each station for a specified year. An annual review of performance compared with standards and targets is mandatory.

15841 **Development and applications of core simulation for the Hanford N Reactor.** Meriwether, G.H.; Skeen, D.R.; Erickson, D.G. (UNC Nuclear Industries, Richland, WA). *Transactions of the American Nuclear Society;* **53**: 462-463(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Efforts to implement improved operating strategies at the Hanford N Reactor required that a sophisticated core physics analysis technique be developed. The code developed had to model the complex geometry of N Reactor, incorporate the control and safety systems, account for radial and axial fuel enrichment variation, provide the necessary reactivity feedbacks, and allow for fuel burnup and xenon tracking. A three-dimensional, two-group, finite difference diffusion code, DELPHI, was developed, tested, and placed in use for this purpose. The size of the model forced the code to be developed on a Class VI computer (CRAY). The overall agreement with observable core data such as flux profiles, power maps, and core excess reactivity predictions confirm that the DELPHI code is a very reliable analytical tool for studying N Reactor core conditions for life-extending core operating strategies.

15842 **Flux flattening in a graphite-moderated core.** Burnside, R.J.; Skeen, D.R.; Finfrock, S.H.; Robinson, A.H.; Toffer, H. (UNC Nuclear Industries, Richland, WA). *Transactions of the American Nuclear Society;* **53**: 463-464(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The N Reactor is a 4000-MW(th), graphite-moderated, pressurized water reactor operated by UNC Nuclear Industries for the US Department of Energy. A flux flattening program was instituted to lower the peak-to-average flux from 1.45 to the 1.25 to 1.30 range. The N Reactor fuel is metallic uranium with discrete enrichment for each element. Element enrichment ranges from 0.71 to 1.15 wt% ^{235}U and lengths from 15 to 26 in. Axially varying fuel element enrichments in a process tube are being used to accomplish the reduced peaking. Development of numerical methods and computer models to provide design information was key to the program's success. The program objectives are to improve operational constraints, safety margins, nuclear material production, and to homogenize fluence impacts over the graphite for the rest of the reactor's life.

15843 **Cobalt processing - flask positioner location sensing system.** Braun, P.F. (AECL, Sheridan Park, Ontario). *Transactions of the American Nuclear Society;* **53**: 520-522(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Canada deuterium uranium (CANDU) reactors offer unique opportunities for economical production of ^{60}Co in the adjuster rods used for xenon override and maximization of core output. Cobalt is effectively a by-product in CANDU reactors with the standards stainless steel adjuster rods replaced with cobalt adjuster rods. The Flask Positioner unit is a part of the cobalt adjuster element processing system (CAEPS) equipment which is used for removing irradiated cobalt adjuster elements from the reactor and safely transporting them to the irradiated fuel bay, where they are dismantled and prepared for shipment. The flask positioner equipment is similar to a crane, carries the CAEPS flask and locates it in an accurate position concentric with any adjuster site centerline. This enables the required operations for safe transfer of the irradiated adjuster element into the flask. The positioner is located above the reactivity mechanism deck. The CAEPS system has been made operational on several CANDU reactors. The location sensing system has been demonstrated to work very satisfactorily on all installations.

15844 **Modeling of drift effects in CANDU reactors.** Sami, S.M. (Univ. of Sherbrooke, Quebec). *Transactions of the American Nuclear Society;* **53**: 551-553(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the most of the Canada deuterium uranium (CANDU) reactor thermohydraulic codes, the two-phase fluid is assumed to be both homogeneous and in thermal equilibrium. However, to account for the unequal velocity effects, several slip and drift correlations are incorporated within these codes. These correlations are in many respects nonmechanistic and inadequate since they do not account for countercurrent or gravity-dominated flow effects. The model described in the paper is the most realistic approach that can be used to describe slip in a transient multipurpose code. Simplified assumptions are made such that only four differential equations must be solved in the code. They are the code continuity, momentum and energy equations for mixture, and one additional equation which describes the spatial- and temporal-dependent behavior of the velocity difference. This latter equation is an arrangement of the two-fluid model equations. The resultant equation gives a time-dependent relation between the phase velocities which are a function of the pressure gradient, phase inertias, volume fraction, the flow regime, and additional constitutive relations.

15845 **Development of a PCMI analysis code for the Fugen MOX fuel rod.** Domoto, K.; Yokouchi, Y.; Kaneko, M.; Shakudo, T. (Power Reactor and Nuclear Fuel Development Corp., 9-13 Akasaka, Minato-ku, Tokyo 107). pp 429-440 of Water reactor fuel element performance computer modelling. Gittus, J. New York, NY; Elsevier Science Pub. Co. Inc. (1983).

Fugen, a 165 MWe prototype of a heavy-water moderated, boiling light-water cooled reactor, has been in operation since March 1979. The reactor power is controlled by 49 control rods and boron concentrations in heavy water. In order to clarify PCMI phenomena and to optimise the Fugen reactor operation, the following research and development is underway: (1) in-pile tests and post-irradiation examinations for clarifying PCMI; and (2) develop-

ment of design and analysis codes, based on the above experiments. The skeleton of the computer model is reported in another paper in this meeting. The applicability of the developed model for PCMI analysis of Fugen fuel was checked by comparing calculations and instrumented irradiation data from the Halden reactor. With the aid of this analysis code, the authors hope to characterise the PCMI phenomena during various kinds of power changes, such as load-follow operation.

15846 **(CONF-860906—21) Transient bowing of core assemblies in advanced liquid metal fast reactors.** Kamal, S.A.; Orechwa, Y. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 14p. NTIS MF A01; 2; GPO Dep. File Number DE87004995.

From Advances in reactor physics and safety meeting; Saratoga Springs, NY, USA (17 Sep 1986).

Two alternative core restraint concepts are considered for a conceptual design of a 900 MWth liquid metal fast reactor core with a heterogeneous layout. The two concepts, known as limited free bowing and free flowering, are evaluated based on core bowing criteria that emphasize the enhancement of inherent reactor safety. The core reactivity change during a postulated loss of flow transient is calculated in terms of the lateral displacements and displacement-reactivity-worths of the individual assemblies. The NUBOW-3D computer code is utilized to determine the assembly deformations and interassembly forces that arise when the assemblies are subjected to temperature gradients and irradiation induced creep and swelling during the reactor operation. The assembly ducts are made of the ferritic steel HT-9 and remain in the reactor core for four-years at full power condition. Whereas both restraint systems meet the bowing criteria, a properly designed limited free bowing system appears to be more advantageous than a free flowering system from the point of view of enhancing the reactor inherent safety.

15847 **(CONF-860908—38) On-line wear monitoring in liquid metal reactors.** Van Echo, A.; Keyvan, S.; King, R.W. (USDOE, Washington, DC; Technology International, Inc., Laplace, LA (USA); Argonne National Lab., Idaho Falls, ID (USA)). 1986. Contract W-31109-ENG-38;AC05-84ER80121. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004714.

From Operability of nuclear power systems in normal and adverse environments meeting; Albuquerque, NM, USA (29 Sep 1986).

Program presented here addresses the design of a Wearout Monitor (WONITOR) for application in Liquid Metal Reactors (LMRs). The WONITOR is based on adaptation of parameter identification techniques to analyze fluctuation data from measurements of parameters related to the equipments of interest. Such parameters are identified as flow rate measurements, temperature, and pressure. Considering the case of EBR-II, fluctuation data from such measurements are evaluated and found adequate for providing information on the state of the selected equipment. No additional instrumentation or sensors seemed to be necessary for the information required for implementation of the WONITOR. The present development of the WONITOR design can be directly applied to other equipment in LMRs. The system can be easily adopted for light water reactors. Also, the wear monitor is suitable for wear detection of equipment operating in hostile environments or in operation environments inaccessible to humans.

15848 **(CONF-860931—9) Recent irradiation tests of uranium-plutonium-zirconium metal fuel elements.** Pahl, R.G.; Lahm, C.E.; Villarreal, R.; Hofman, G.L.; Beck, W.N. (Argonne National Lab., Idaho Falls, ID (USA); Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 17p. NTIS MF A01; 2; GPO Dep. File Number DE87004980.

From International conference on reliable fuels for liquid metal reactors; Tucson, AZ, USA (7 Sep 1986).

Uranium-Plutonium-Zirconium metal fuel irradiation tests to support the ANL Integral Fast Reactor concept are discussed. Satisfactory performance has been demonstrated to 2.9 at.% peak burnup in three alloys having 0, 8, and 19 wt % plutonium. Fuel swelling measurements at low burnup in alloys to 26 wt % plutonium show that fuel deformation is primarily radial in direction. Increasing the plutonium content in the fuel diminishes the rate of fuel-cladding gap closure and axial fuel column growth. Chemical redistribution occurs by 2.1 at.% peak burnup and generally involves the inward migration of zirconium and outward migration of uranium. Fission gas release to the plenum ranges from 46% to 56% in the alloys irradiated to 2.9 at.% peak burnup. No evidence of deleterious fuel-cladding chemical or mechanical interaction was observed.

15849 **(CONF-860931—15) Fission gas retention and axial expansion of irradiated metallic fuel.** Fenske, G.R.; Emerson, J.E.; Savoie, F.E.; Johanson, E.W. (Argonne National Lab., IL (USA)). May 1986. Contract W-31109-ENG-38. 29p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004759.

From International conference on reliable fuels for liquid metal reactors; Tucson, AZ, USA (7 Sep 1986).

Out-of-reactor experiments utilizing direct electrical heating and infrared heating techniques were performed on irradiated metallic fuel. The results indicate accelerated expansion can occur during thermal transients and that the accelerated expansion is driven by retained fission gases. The results also demonstrate gas retention and, hence, expansion behavior is a function of axial position within the pin.

15850 **(CONF-860931—16) Factors controlling metal fuel lifetime.** Porter, D.L.; Hofman, G.L.; Seidel, B.R.; Walters, L.C. (Argonne National Lab., Idaho Falls, ID (USA); Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004756.

From International conference on reliable fuels for liquid metal reactors; Tucson, AZ, USA (7 Sep 1986).

The reliability of metal fuel elements is determined by a fuel burnup at which a statistically predicted number of fuel breaches would occur, the number of breaches determined by the amount of free fission gas which a particular reactor design can tolerate. The reliability is therefore measured using experimentally determined breach statistics, or by modelling fuel element behavior and those factors which contribute to cladding breach. The factors are fuel/cladding mechanical and chemical interactions, fission gas pressure, fuel phase transformations involving volume changes, and fission product effects on cladding integrity. Experimental data for EBR-II fuel elements has shown that the primary, and perhaps the only significant factor affecting metal fuel reliability, is the pressure-induced stresses caused by fission gas release. Other metal fuel/cladding systems may perform similarly.

15851 **(CONF-861211—22) The development of a cavitation free sodium pump for the breeder reactor.** Baladi, J.Y.; Nyilas, C.P. (Westinghouse Research and Development Center, Pittsburgh, PA (USA); Westinghouse Electric Corp., Cheswick, PA (USA). Electromagnetic Div.). Dec 1986. Contract W-31109-ENG-38. 37p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004826.

From American Society of Mechanical Engineers winter meeting; Anaheim, CA, USA (7 Dec 1986).

The sodium pumps for a liquid metal fast breeder reactor must be designed for exceptionally high reliability and long life. The principal adverse factor which tends to limit the primary pump life is cavitation which becomes potentially severe under off-design flow conditions caused by the requirement of two loop operations which resulted in a large operating flow range. This problem prompted an extensive study which included experimental investigations of scaled down and full size pumps. The investigations involved visual observations, acoustic signature recordings, and physical characteristic measurements of the model and full size impellers. The blade configuration of the model was modified several times. After each modification intensive testing was conducted with feedback to established design criteria. The results obtained from

the final configuration showed excellent cavitation performance. This configuration was then machined on the full scale impeller and tested. The results confirmed acceptable performance in the entire range of operating conditions. This paper describes the test facilities erected for this study, discusses the experimental techniques employed, and presents the experimental techniques employed, and presents a sample of the experimental results.

15852 **(HEDL-SA—2939-A, pp 133-137) Decontamination process for hot leg LMFBR components.** Lutton, J.M.; Maffei, H.P.; Colburn, R.P.; Brehm, W.F.; Anantatmula, R.P.; Bechtold, R.A.; Hall, M.B.; Steele, O.P.; Hill, E.F. May 1983. NTIS. (CONF-840411—). Contract AC06-76FF02170.

From 3. meeting on liquid metal in energy applications; Oxford, UK (9 Apr 1984).

Bench scale tests showed the glycolic-citric acid process to produce acceptable metal removal rates on cast and wrought austenitic stainless steels, provided the dissolved oxygen content of the solution was maintained at < 10 parts per billion. Diffusion studies showed nuclide penetration greatest in CF-8 (304 cast) followed by 304 wrought, CF-8M, and 316 wrought, however the same decontamination treatment applied to the four steels simultaneously showed the metal removal to be greatest in CF-8 and smallest in 316, in the same order. (In other words, the material showing the greatest nuclide penetration had the highest removal rate in the decontamination solution). Feature tests showed the process to be easily integrated with the water vapor nitrogen sodium removal process. Process control, including methods for sampling, for producing and measuring < 10 ppb dissolved oxygen, and for terminating the process - was achieved without difficulty. A 14 day treatment at 90°C effectively decontaminated all materials. Longer treatments did not improve the decontamination effectiveness and damaged one of the heats of 316 stainless steel. Colmonoy bearing materials were severely damaged by the treatment; Stellite bearing materials were unaffected.

15853 **(HEDL-SA—3336-FP) Performance of liquid metal reactor fuel pins with D9 cladding.** Makenas, B.J.; Hales, J.W. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1985. Contract AC06-76FF02170. 6p. (CONF-851115—52). NTIS, PC A02/MF A01; GPO Dep. File Number DE87005456.

From American Nuclear Society winter meeting; San Francisco, CA, USA (10 Nov 1985).

The use of 316 stainless steel (SS) for Liquid Metal Fast Reactor applications is limited because of its tendency to swell significantly under neutron irradiation. Consequently, a number of alloys have been proposed as advanced cladding materials including precipitation hardened alloys, ferritic materials, and titanium modified versions of austenitic 316 SS. One of the latter type of alloys is called and is similar in composition to 316 SS but with titanium additions of ~0.25%. Three mixed-oxide $(U,Pu)O_2$ fuel tests containing D9-clad pins have been successfully irradiated in EBR-II. They have demonstrated significantly lower swelling for D9 than for the reference 316 SS cladding and have shown that the behavior of D9 is very similar to 316 SS with respect to other properties important to reactor design. In two of the tests (designated P43 and P44), D9 was irradiated side-by-side with various other cladding materials. Two different variations of D9 (differing primarily in molybdenum), two cladding cold work levels, and two fuel smeared densities (85% and 89% TD) were explored. The third test, P45, was made up exclusively of 20% CW D9-clad pins.

15854 **(HEDL-SA—3475-FP) SIEX3: A correlated computer code for prediction of fast reactor mixed oxide fuel and blanket pin performance.** Baker, R.B.; Wilson, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1986. Contract AC06-76FF02170. 12p. (CONF-860931—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004346.

From International conference on reliable fuels for liquid metal reactors; Tucson, AZ, USA (7 Sep 1986).

The SIEX3 computer program was developed to calculate the fuel and cladding performance of oxide fuel and oxide blanket pins irradiated in the fast neutron environment of a liquid metal cooled reactor. The code is uniquely designed to be accurate yet quick running and use a minimum of computer core storage. This was accomplished through the correlation of physically based models to very large data bases of irradiation test results. Data from over 200 fuel pins and over 800 transverse fuel microscopy samples were used in the calibrations.

15855 **(HEDL-SA—3484-FP) Design limits for HT9 cladding using stress-induced aging data.** Fox, G.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1986. Contract AC06-76FF02170. 7p. (CONF-860931—8). NTIS, PC A02/MF A01; GPO Dep. File Number DE87004348.

From International conference on reliable fuels for liquid metal reactors; Tucson, AZ, USA (7 Sep 1986).

Stress-temperature design guidelines are developed for the ferritic/martensitic cladding material HT9. High temperature operation for HT9 may cause microstructural changes/aging which softens the structure and causes increased creep rates. Higher creep strains means cladding breech becomes more probable before the end of the expected pin lifetime. Tertiary creep is considered an indication of microstructural changes and is to be avoided in fuel pin operation. The creep rate correlation, which includes tertiary creep, is examined for information on stress-temperature relationships which promote aging. This approach leads to design limits for HT9 which are compared with expected hot channel conditions for fuel pins in the Core Demonstration Experiment (CDE) planned for FFTF. The results show aging should not be significant for CDE.

15856 **(INIS-mf—10560) Advances in sodium technology, testing and diagnostics of fast reactors.** Sulc, V. (ed.). (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). 1984. 286p. (In Czech and Russian). NTIS (US Sales Only), PC A13/MF A01. File Number DE87700741.

Selected papers from three international specialists' meetings held in April 1983, September 1982 and April 1977.

The collection contains a selection of 29 papers from three international specialists' meetings: the CMEA conference "Control and measuring instruments and diagnostic systems of fast reactors" held in the GDR in April 1983; the IAEA conference on nuclear power experience held in Austria in September 1982; and the conference "Problems of technology and corrosion in sodium coolant and protective gas" held in the GDR in April 1977. Three papers on operating experience with Soviet fast reactors and their safety have a general character; they are followed up by three papers on sodium technology. Five papers deal with the diagnostics of fast sodium cooled reactors and nine papers are devoted to the diagnostics of steam generators. Eight papers relate to detectors for the diagnostics of fast reactors. Safety regulations for work with alkali metals are added. (A.K.).

15857 **(WAPD-TM—1548) In-pile and out-of-pile corrosion behavior of thoria-urania pellets (LWBR [Light Water Breeder Reactor] Development program).** Clayton, J.C. (Bettis Atomic Power Lab., West Mifflin, PA (USA)). Jan 1987. Contract AC11-76PN00014. 59p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87005621.

The out-of-pile corrosion behavior of ThO_2 and ThO_2-UO_2 fuel pellets was studied in high temperature, flowing, oxygenated water. Weight changes of the specimens were determined periodically during the corrosions exposures, some of which were as long as 265 days; in addition, ceramographic examinations were carried out on selected specimens. Both ThO_2 and homogeneous ThO_2-UO_2 (2 to 30 wt % UO_2) fuel showed excellent corrosion resistance, the former intrinsically because it cannot be oxidized and the latter because oxidation creates a mechanically stable surface phase. These out-of-pile results predicted favorable corrosion stability in defected irradiated fuel elements. The maintenance of ThO_2 and ThO_2-UO_2 fuel integrity in defected fuel rods was confirmed by an irradiation test program. Both the in-pile and out-of-pile test results support the conclusion that LWBR-type fuel rods containing ThO_2 and ThO_2-UO_2 pellets can successfully operate in the defect condition with limited radioactivity release to the coolant.

15858 Monte Carlo narrow resonance calculational techniques for treating double-heterogeneity effects. Gelbard, E.M.; Chen, I.J. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* **53**: 245-246(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Reliable methods already exist for computing resonance intergrals (RIs) in regular lattices. But lattice structures always contain irregularities; e.g., in liquid-metal fast breeder reactor hexagonal steel walls (wrappers) surrounding subassemblies, and adjacent zones with excess sodium. Such effects have been called double-heterogeneity effects. A method has recently been proposed for computing double-heterogeneity effects on RIs. This method (method 1) uses group-averaged cross sections to get collision probabilities from a (cylindricized) sodium-wrapper region to the various (cylindricized) rings of pins, and thus involves very nontrivial approximations. Method 1 is based on the NR (or IR) approximation. The authors develop a diagnostic Monte Carlo method (method 2) which retains the NR-IR approximation, but treats cross-section variations and geometry in great detail. The NR-IR approximations also cause errors but (a) a full ring-by-ring Monte Carlo RI calculation would be very expensive, and (b) separation of errors into NR-IR errors and errors of other types may prove useful for diagnostics. After describing method 2, the authors illustrate its use by testing the method 1 calculations of a reference problem.

15859 Validation of an intermediate heat exchanger model for real-time analysis. Tzanos, C.P. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* **53**: 255-257(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In earlier work, a new method was presented for liquid-metal fast breeder reactor intermediate heat exchanger (IHX) analysis in real time for purposes of continuous on-line data validation, plant state verification, and fault identification. For validation of this methodology, the Experimental Breeder Reactor-II (EBR-II) IHX transient during Test 8A was analyzed. This paper presents the results of this analysis.

15860 Complete sodium removal from equipment. Huebner, M.F.; Abrams, C.S. (Argonne National Lab.-West, Idaho Falls, ID). *Transactions of the American Nuclear Society;* **53**: 404(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Proving that metallic sodium could be successfully removed from the complex internal and external geometries of equipment (such as breeder reactor components) was one goal of the US Department of Energy's (DOE's) Sodium Waste Technology Program. A pilot-plant facility was designed and built for sodium removal at the Argonne National Laboratory-West (ANL-W) site. The pilot plant is called the Sodium Process Demonstration (SPD) Facility. It uses a combination of melt-drain-evaporate-calcine (MEDEC) processes to remove metallic sodium from large (up to 1.4-m-diam x 2.2-m-long) nonradioactive-sodium-bearing equipment. The sodium-free equipment can then be reused or disposed of using normal waste disposal methods. The sodium can be converted to storable sodium monoxide or disposed of by other means. Evaluating the effectiveness of this MEDEC process was the object of a methodical test program. After this test program proved successful, the MEDEC process was used on a production scale to remove metallic sodium from a variety of sodium-bearing items as described.

15861 Reactivity worth of gas expansion modules (GEMs) in the fast flux test facility. Campbell, L.R.; Nelson, J.V.; Burke, T.M.; Rawlins, J.A.; Daughtry, J.W.; Bennett, R.A. (Westinghouse Hanford, Richland, WA). *Transactions of the American Nuclear Society;* **53**: 457-458(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A new passive shutdown device called a gas expansion module (GEM) has been developed at Hanford Engineering Development Laboratory to insert negative reactivity during a primary system loss of flow in a liquid-metal reactor (LMR). A GEM is a hollow removable core component which is sealed at the top and open at the bottom. An argon gas bubble trapped inside the assembly expands when core inlet pressure decreases (caused by a flow reduction) and expels sodium from the assembly. The GEMs are designed so that the level of the liquid-sodium primary system coolant within a GEM is above the top of the core when the primary pumps are operating at full flow and is below the bottom of the core when the primary pumps are off. When a GEM is placed at the boundary of the core and radial reflector, the drop in sodium level increases core neutron leakage and inserts negative reactivity. The results of these measurements confirm the effectiveness of GEMs in adding negative reactivity in loss-of-flow situations. It follows, therefore, that the inherent safety of LMRs, comparable in size to the FFTF, can be enhanced by the use of GEMs.

15862 Physics considerations in the design of long-life cores. Orechwa, Y. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* **53**: 458-459(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This study quantifies the neutronic requirements for a long life core design. These requirements center about the achievement of a high internal conversion ratio. This especially in the case of oxide fuel, requires extremely aggressive designs, both from the high fuel volume fraction requirement and the demands on materials behavior under the high fast fluences.

15863 Delineations of power and power-to-flow feedback components of EBR-II. Meneghetti, D.; Kucera, D.A. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* **53**: 459-460(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The detailed contributions of feedback components by regions for various experimental breeder reactor-II (EBR-II) configurations have been reported assuming given values for the coolant flows. The separation of these components into power dependent and power-to-flow dependent parts if reported here for EBR-II run 93A. The power-reactivity-decrement (PRD) can then be expressed as the sum of parts which enables the PRD for other values of coolant flow to be estimated. The delineations of the components also enhance the understanding of the contributions of the various components and regions in the feedback process in EBR-II. Separation of the components into power and power-to-flow delineations were made by calculations of the components of the PRD assuming infinite coolant flow and comparing with results previously reported for finite flow. Subtractions of the infinite-flow feedback values from the corresponding finite-flow values give the power-to-flow portions. These linear and Doppler components of the PRDs were calculated using the EBRPOCO program together with an addition to the program (RODCO) which accounts for the effects of axial positionings of control rods.

15864 Qualification of an LWBR-irradiated fuel assay gauge. Tessler, G.; Beaudoin, B.R.; Beggs, W.J.; Freeman, L.B.; Goldberg, I.; Hecker, H.C.; Kahler, A.C.; Schick, W.C. Jr.; Simon, C.J.; Raab, H.F. (Bettis Atomic Power Lab.). *Transactions of the American Nuclear Society;* **53**: 464(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A production-irradiated fuel assay gauge (PIFAG) has been developed with the capability of determine, nondestructively, the total fissile fuel content (loading) of an irradiated fuel rod with a precision of 0.5% or better. This gauge was developed by the Bettis Atomic Power Laboratory under the technical direction of the US Department of Energy's Office of Naval Reactors to be used for proving breeding in the light water breeder reactor (LWBR). This paper presents nondestructive and destructive data that demonstrate the high precision, accuracy, and stability of the PIFAG. The PIFAG is being qualified by comparison of PIFAG results with destructive assay results for 17 rods, repeated assay at long time intervals of a selected number of rods of each type, and

continuous monitoring with a normalization rod. These data demonstrate that the PIFAG meets the precision objectives of the fissile loading determination.

15865 **Bowing of elements and changes in radial coolant temperature profile over subassembly lifetime.** Betten, P.R. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* **53**: 532-533(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A time-temperature history of in-core thermocouples has been kept for an instrumented subassembly irradiated in the Experimental Breeder Reactor-II (EBR-II). This paper presents some of the data which indicate that (a) the radial coolant temperatures tend to flatten out with irradiation, (b) this flattening is gradual, with time, after a short incubation period, and (c) these changes are caused by element bowing and redistribution.

15866 **The U.S. fast reactor materials and structures program.** Harms, W.O.; Purdy, C.M. (Oak Ridge National Lab., Oak Ridge, TN 37831). pp 145-154 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—). Contract AC05-84OR21400.

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

The U.S. Department of Energy has sponsored a vigorous breeder reactor materials and structures program for about 15 years. Important contributions to breeder development have resulted from this effort in the areas of design (inelastic rules, verified methods, seismic criteria, mechanical properties data); resolution of licensing issues (technical witnessing, confirmatory testing); construction (fabrication/welding procedures, nondestructive testing techniques); and operation (sodium purification, instrumentation and chemical analysis, radioactivity control, and in-service inspection). The national LMFBR program currently is being restructured to address base technology needs for innovative designs that are economically competitive and demonstrably safe. It is anticipated that in support of this activity the Materials and Structures Program will focus its efforts in the following areas: (1) removal of anticipated licensing impediments through confirmation of the adequacy of structural design methods and criteria for components containing welds and geometric discontinuities, the generation of mechanical properties for stainless steel castings and weldments, and the evaluation of irradiation effects; (2) qualification of modified 9 Cr- 1 Mo steel and tribological coatings for design flexibility; (3) development of improved inelastic design guidelines and procedures; (4) reform of design codes and standards and engineering practices, leading to simpler, less conservative rules and to simplified design analysis methods; and (5) incorporation of information from foreign programs through exchange and collaboration.

2106 Power Reactors, Auxiliary, Mobile, Package, And Transportable

15867 **(ORNL/TM—10267) Assessment of ceramic composites for multimegawatt space nuclear power systems.** Besmann, T.M. (Oak Ridge National Lab., TN (USA)). Dec 1986. Contract AC05-84OR21400. 24p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005272.

A calculational thermodynamic equilibrium analysis of the compatibility of ceramic-ceramic composites and a nonequilibrium assessment based on the literature of their use in proposed multimegawatt space nuclear power systems was performed. The five candidate composites included Al_2O_3-reinforced Al_2O_3, SiC-whisker-toughened Al_2O_3, SiC-whisker-toughened Si_3N_4, SiC-fiber-reinforced ZrC, and carbon-fiber-reinforced ZrC. The reactor concepts included Brayton cycle (continuous and burst mode) and Rankine cycle. It was determined that Al_2O_3-reinforced Al_2O_3 and carbon-fiber-reinforced ZrC are compatible in the Brayton-cycle continuous-mode system and that Al_2O_3-reinforced Al_2O_3, SiC-fiber-reinforced ZrC, and carbon-fiber-reinforced ZrC are compatible in the Rankine-cycle system. None of the candidate ceramic composite systems was likely to be sufficiently stable under Brayton-cycle burst-mode conditions.

15868 **Fuel system and structural alloy considerations for space nuclear reactor systems.** Hoffman, E.E.; Cooper, R.H. Jr. (US Dept. of Energy, Oak Ridge, TN 37831). pp 157-161 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—). Contract AC05-84OR21400.

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

Sufficient data exist to provide a high level of confidence that refractory-alloy-clad ceramic fuel pins and refractory structural alloys can be used successfully in an operational space power system. However, data are not yet sufficient to ensure that these materials can meet the temperature, lifetime, and system mass envelope requirements for reliable operation of a 100 kW(e) system as specified by the SP-100 Project. Development efforts to provide these data are being initiated.

15869 **(CONF-861185—3) Effect of changes in DOE pricing policies for enrichment and reprocessing on research reactor fuel cycle costs.** Matos, J.E.; Freese, K.E. (Argonne National Lab., IL (USA)). 3 Nov 1986. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004685.

From Reduced Enrichment for Research and Test Reactors (RERTR) program international meeting; Gatlinburg, TN, USA (3 Nov 1986).

Fuel cycle costs with HEU and LEU fuels for the IAEA generic 10 MW reactor are updated to reflect the change in DOE pricing policy for enrichment services as of October 1985 and the published charges for LEU reprocessing services as of February 1986. The net effects are essentially no change in HEU fuel cycle costs and a reduction of about 8 to 10% in the fuel cycle costs for LEU silicide fuel.

15870 **(IAE—4072/3) Nuclear power safety economics.** Legasov, V.A.; Demin, V.F.; Shevelev, Ya.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1984. 48p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700703.

The existing conceptual and methodical basis for the decision-making process insuring safety of the nuclear power and other (industrial and non-industrial) human activities is critically analyzed. Necessity of development a generalized economic safety analysis method (GESAM) is shown. Its purpose is justifying safety measures. Problems of GESAM development are considered including the problem of costing human risk. A number of suggestions on solving them are given. Using the discounting procedure in the assessment of risk or detriment caused by harmful impact on human health is substantiated. Examples of analyzing some safety systems in the nuclear power and other spheres of human activity are given. 48 refs.; 7 figs.; 2 tabs.

15871 **(IAEA-TECDOC—376) Small and medium power reactors 1985. Report of two meetings on small and medium power reactors: A scientific afternoon held on 25 September 1985 and technical committee meeting held on 26 September 1985. Both meetings were held in Vienna during the General Conference of the IAEA.** (International Atomic Energy Agency, Vienna (Austria)). May 1986. 103p. (CONF-8509366—). NTIS (US Sales Only), PC A06/MF A01. File Number DE87700889.

From IAEA general conference on small and medium power reactors; Vienna, Austria (25 Sep 1985).

This report is intended for designers and planners concerned with Small and Medium Power Reactors. It provides a record of the presentations during the meetings held on this subject at the Agency's General Conference in September 1985. This information should be useful as it indicates the principal findings and main conclusions and recommendations resulting from these meetings. A separate abstract was prepared for each of the 10 presentations in this report.

15872 (IAEA-TECDOC—376, pp 15-29) **Economic case for small and medium power reactors in India.** Srinivasan, M.R. (Department of Atomic Energy, Bombay, India). May 1986. NTIS (US Sales Only), PC A06/MF A01. File Number DE87700889. (CONF-8509366—).

From IAEA general conference on small and medium power reactors; Vienna, Austria (25 Sep 1985).

The Indian case of the use of small and medium sized power reactors is described in this paper in conjunction with the Indian nuclear power programme and in terms of operational experience, standardization of designs, choice of unit size, industrial infrastructure, and economic aspects. Figures and graphs show the Indian nuclear programme up to year 2000 A.D., the performance of Indian nuclear power stations, safety provisions in Indian PHWR design, sizewise distribution of power plants in India, growth of manufacturing capability for components, manufacturing cycle time of nuclear reactor components, break-up of expenditures for the 10,000 MW nuclear power programme, nuclear power investment costs in India, cost structure of Indian nuclear stations, cost of generation from nuclear and thermal stations in operation, and total fuel cycle investment costs. 14 figs.

15873 (IAEA-TECDOC—376, pp 31-43) **Experience with Atucha I Nuclear Power Plant, both as regards technology transfer arrangements and operational experience.** Quihillalt, O.J. (Comision Nacional de Energia Atomica, Buenos Aires, Argentina. Cost and Planning Div.). May 1986. NTIS (US Sales Only), PC A06/MF A01. File Number DE87700889. (CONF-8509366—).

From IAEA general conference on small and medium power reactors; Vienna, Austria (25 Sep 1985).

This paper describes in a stepwise fashion according to the different stages of the Atucha Nuclear Power Plant project the experience and transfer of technology obtained by Argentina and Comision Nacional de Energia Atomica (CNEA) in connection with the construction of the power plant. The following is described briefly: Planning, requests for offers, evaluation of proposals, contract award, participation of national industry, participation of CNEA's personnel, training of operating personnel, development of the project, commissioning, take-over, plant operation, analysis of the performance (number of outage, load factor, availability factor, fuel burning, heavy water leakage, production costs), and the client-supplier relation. An annex contains representative technical data on the Atucha I reactor.

15874 (IAEA-TECDOC—376, pp 45-49) **Background for and experience with Qinshan project in China.** Ouyang Yu. (Shanghai Nuclear Engineering R and D Inst., China). May 1986. NTIS (US Sales Only), PC A06/MF A01. File Number DE87700889. (CONF-8509366—).

From IAEA general conference on small and medium power reactors; Vienna, Austria (25 Sep 1985).

Qinshan Nuclear Power Plant is now under construction. It is expected to be commissioned in 1989. The construction of this NPP is an important part of China's nuclear power development plan. This paper describes briefly the following: 1. The need for developing nuclear power in China and its favorable condition for this development. 2. Research and development works for the 300 MW(e) Qinshan nuclear power project. 3. Design and construction of the power plant. 4. Organization and manpower preparation. 5. Significance of the construction of the Qinshan NPP (PWR type reactor). The advantages of using SMPRs (Small and Medium Power Reactors) in China are mentioned finally.

15875 (IAEA-TECDOC—376, pp 59-67) **Electric Power Research Institute (EPRI) study on small and medium power reactor concepts having present potential for the USA.** Braun, C. (Eiectric Power Research Inst., Palo Alto, CA, USA). May 1986. NTIS (US Sales Only), PC A06/MF A01. File Number DE87700889. (CONF-8509366—).

From IAEA general conference on small and medium power reactors; Vienna, Austria (25 Sep 1985).

This paper focuses on the EPRI small light water reactor programme (which is a part of a more general programme of advanced light water reactors study of both large and small). The reasons why American utilities are interested in small reactors are stated. The issue of cost is mentioned as the major problem confronting nuclear power plants in the USA today. The major problem in controlling the base cost is considered to be the increase in labour charges rather than materials. It is hoped that through the design of simplified and standardized plants it will be possible to cut down the costs. There is also a need for modular construction and shop-fabrication. With this need in view, the general objective of the smaller reactor programme that we have embarked on at EPRI is to provide a reactor plant of 400-600 MW design or at least the conceptual design of such a plant. Actually the first part of the programme is only pre-conceptual design with the general groundrule that the plants' total generation costs should be equal to coal generation costs in the United States. The capital costs of the small LWRs should not be higher than the capital costs of the current large nuclear power plants. The programme is made up of two phases. The first phase of the programme in now under way and that includes the selection of three design teams made up of most of the vendors and architect engineering companies in the United States to do a pre-pre-conceptual design of a plant that will cut the capital cost and try to provide us the objectives that we have listed above. Then there is going to be a second phase in which one or two of the better designs that come out during the first phase will be further carried out to a full conceptual design. 3 figs, 6 charts.

15876 (IAEA-TECDOC—376, pp 77-78) **Presentation of the purpose of the meeting.** Char, N.L. (International Atomic Energy Agency, Vienna, Austria. Div. of Nuclear Power). May 1986. NTIS (US Sales Only), PC A06/MF A01. File Number DE87700889. (CONF-8509366—).

From IAEA general conference on small and medium power reactors; Vienna, Austria (25 Sep 1985).

The situation of SMPRs now shows a complete reversal of the situation which prevailed a decade ago when potential SMPR buyers were relatively numerous but suppliers showed little interest to produce a new power plant design. There is now an increasing interest for SMPRs on the supplier side but that buyer countries hesitate to take a decision probably both because they are aware of the problems linked with the introduction of nuclear power and because they want assurance of the economics of a project before launching it. That assurance is only possible to achieve in more country-specific studies. That is why the Agency decided to hold this meeting directed to prospective buyers in order to provide them with an opportunity to be informed about the results of the first phase of the SMPR Project Initiation Study and to define better the specific constraints which they see to exist in the introduction of SMPRs in developing countries and consider the possible ways and means of removing those constraints.

15877 (IAEA-TECDOC—376, pp 79-85) **Presentation of main results of Phase I of the SMPR project initiation study.** Wald, F. (International Atomic Energy Agency, Vienna, Austria. Div. of Nuclear Power). May 1986. NTIS (US Sales Only), PC A06/MF A01. File Number DE87700889. (CONF-8509366—).

From IAEA general conference on small and medium power reactors; Vienna, Austria (25 Sep 1985).

As a result of a first Technical Committee Meeting held in Vienna in August 1983 the IAEA launched a new SMPR Project Initiation Study with the objective of surveying the available designs, examining the major factors influencing the decision-making processes in developing countries and thereby also arriving at an estimate of the potential market. The Nuclear Energy Agency of OECD offered its assistance in making a study of the potential market in industrialized countries. Two questionnaires were used to

obtain information from potential suppliers and buyers. Suppliers responded with an overwhelming 23 design concepts which could be offered for export but with varying levels of readiness and provenness. From potential buyers 17 responses were received, 16 of which were from the developing countries. The analysis of the responses which was done by the Agency with the help of experts from Member States gave the basis for a draft report including the OECD/NEA part. This draft was discussed during a second Technical Committee Meeting held in Vienna in March 1985. The meeting was characterized by a strong supplier interest but also by hesitation of potential buyers to make any kind of commitments relating to the market introduction of SMPRs. All new information has been incorporated into the report together with a number of expressed comments, especially related to the presentation of the economics of SMPRs, the necessity of a reference plant, provenness of major components and systems etc. The results of the study are presented here with direct reference to the SMPR supply situation and the potential market for SMPRs in terms of the decision-making factors: the financial factors, the economical factors, and the technological factors were identified as the most important ones. The economic competitiveness is not the only decision-making factor and consequently it was decided to end the general study called Phase I by the publication of a report.

15878 (IAEA-TECDOC—376, pp 87-96) **Presentation of the results of the seminar on cost and financing of nuclear power programmes in developing countries.** Bennett, L.L. (International Atomic Energy Agency, Vienna, Austria. Div. of Nuclear Power). May 1986. NTIS (US Sales Only), PC A06/MF A01. File Number DE87700889. (CONF-8509366—).

From IAEA general conference on small and medium power reactors; Vienna, Austria (25 Sep 1985).

The Agency organized a Seminar on Costs and Financing of Nuclear Power Programmes in Developing Countries, in Vienna during 9-12 September 1985. The seminar dealt with three main topics: 1. Nuclear investment and fuel cycle costs; 2. Financial risk assessment at project and country levels; 3. Loan conditions. The primary objective of the seminar was to promote a dialogue among the various parties involved in the domain of nuclear power financing, i.e., buyers, suppliers and financing organizations. The keen interest in this topic was demonstrated by the participation of some eighty delegates from twenty-nine Member States (eighteen of them developing countries) and seven international organizations. Many financing organizations were represented in the seminar. The Agency presented information from its own studies as well as results from studies by other international organizations. In spite of their proven overall economic competitiveness, the high capital requirements for nuclear power plants pose difficult financing problems and financing remains a major constraint on nuclear power programmes in developing countries. Some mechanisms that could be used in conjunction with the traditional financing approach were proposed as measures to improve the present situation. The catalytic role that the IAEA could play in order to establish new working relationships on the part of potential buyer countries, suppliers and lending organizations was strongly emphasized. It was recommended that the Agency develop and strengthen its contacts with commercial lenders and with export-credit agencies, in order to enlarge its role to assist in developing new financing concepts better adapted to the nuclear domain. A status of nuclear power programmes in developing member states is included. 1 tab.

15879 (IAEA-TECDOC—376, pp 97-98) **Analysis of the invited countries questionnaire responses.** Wald, F. (International Atomic Energy Agency, Vienna, Austria. Div. of Nuclear Power). May 1986. NTIS (US Sales Only), PC A06/MF A01. File Number DE87700889. (CONF-8509366—).

From IAEA general conference on small and medium power reactors; Vienna, Austria (25 Sep 1985).

15881 (IAEA-TECDOC—378) **Costs and financing of nuclear power programmes in developing countries. Proceedings of a seminar held in Vienna, 9-12 September 1985.** (International Atomic Energy Agency, Vienna (Austria)). Jul 1986. 331p. (CONF-850931—). NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707.

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

This seminar organized by the IAEA dealt with three main topics: 1) Nuclear investment and fuel cycle costs. 2) Financial risk assessment at project and country levels. 3) Loan conditions. Its main objective was to promote a dialogue among the various parties involved. As it focuses on nuclear and electric power programmes in developing countries a status of this topic is given in the introduction.

15882 (IAEA-TECDOC—378, pp 15-56) **Status of and perspectives and constraints for nuclear power in developing countries.** Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

This status of the perspectives and constraints for nuclear power in developing countries deals with the following topics: 1) The energy situation in developing countries. 2) Conditions for introduction of nuclear power in developing countries. 3) Competitive situation of nuclear power in developing countries. 4) Technical and economic provenness of nuclear power. 5) Economic viability of nuclear power. In addition hereto it contains the following appendices: a) economic performance outlook of nuclear power plants (in Belgium, Canada, France, India, Japan); b) Payback time for nuclear power plants relative to coal plants; c) Simplified example of loan analysis. 8 refs, 11 figs and tabs.

15883 (IAEA-TECDOC—378, pp 57-58) **Presentation of the SMPR study.** Wald, F. (International Atomic Energy Agency, Vienna, Austria. Div. of Nuclear Power). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

The first phase of the Small and Medium Power Reactor Study (the SMPR Study) has been completed. The study has led to the collection of brief descriptions of 23 designs of SMPRs, covering the whole range and at different stages of development. It has helped shed light on several factors, the most important of which are as follows: 1) financing difficulties; 2) the economics of SMPRs in comparison with the other options; 3) infrastructure requirements in industry and with respect to manpower.

15884 (IAEA-TECDOC—378, pp 59-72) **Financing electric power in developing countries.** Heron, A. (World Bank, Washington DC, USA. Energy Dept.). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

The paper discusses the future growth of electricity demand, the likely changes in power investment patterns, and the global investment requirements during the 10 year period 1986-1995 for power generation, transmission, and distribution. The investment during the period is analysed as between foreign and local currency requirements, the likely principal sources of finance, the problems which are experienced in financing power investment, and the origin of those problems. The paper provides details of the origin,

nature and finances of the World Bank Group, reviews its past lending operations and some of the broader aspects of its lending operations.

15885 (IAEA-TECDOC—378, pp 103-104) **Nuclear power costs in developing countries.** Meyer, P.J. (Kraftwerk Union A.G., Erlangen, Germany, F.R.). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

Talking about costs for nuclear power plants a lot of parameters have to be analysed influencing the costs, such as the size of the nuclear program and the plant capacity of each unit. Regarding experience in several cases of export orders with a high content of national participation, the cost for a nuclear power plant became much higher than previously calculated because of several cost influencing factors, which are mentioned in the paper. A further aspect influencing the development is the extensive technology transfer program, which may have to be established within the frame of a complete nuclear program.

15886 (IAEA-TECDOC—378, pp 105-116) **Indian experience in investment cost in Small Size Nuclear Power Reactor Units.** Parthasarathi, A.R. (Department of Atomic Energy, Bombay, India). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

This paper describes the Indian situation and experience in relation to the investment in Small Size Nuclear Power Reactor Units. Data are given on nuclear power investment costs. The characteristics of the Indian experience are also given in detail. Nuclear power generation costs and pricing are discussed. Important parameters used for calculating unit energy cost from nuclear power plants are listed. Nuclear and thermal power costs are compared. The variation of unit energy cost with change in various parameters is explained. 4 tabs.

15887 (IAEA-TECDOC—378, pp 117-121) **Economic efficiency of nuclear power in the People's Republic of China.** Luo Anren; Yang Xianshu. (Office of Nuclear Power Steering Committee, State Council, Beijing, China). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

In the majority of cases the construction cost of a nuclear power station is higher than that of a coal fired power station of the same output, while its generation cost is lower. As a whole, the economic efficiency of the nuclear power is higher than that of coal power. In China however, the situation is somewhat different. This paper explains why in China one has to take into account special factors. The economic parameters used for calculating the generation cost are listed. A comparison of generation costs in China for nuclear power stations and coal-fired power stations, respectively, is made. 1 tab.

15888 (IAEA-TECDOC—378, pp 123-129) **Factors influencing capital costs of nuclear power plant in Finnish conditions.** Vuorinen, A. (IVO Consulting Engineers Ltd, Helsinki, Finland). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

This paper is based on the experience gained in construction and operation of nuclear power plants in Finland. It discusses the various factors influencing the capital costs of nuclear power plants in the Finnish context. It deals with such topics as: 1. Basic plant design features; 2. Main supplier's and owner's involvement; 3. Productivity of implementation; 4. Government influence (taxation policy and energy policy); 5. Experience of the organizations. Tables are given on the factors influencing the costs and the nuclear power costs in Europe. 1 ref, 2 tabs.

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

In this paper it is shown that introduction of nuclear power in Bangladesh is a necessity of the country, has to pursue its goals of attaining desired growth of economy and meet the electricity requirements of the future. The efforts to implement a nuclear power project has suffered so far due to lack of necessary financing, the energy situation of the country and the projected growth of electricity. The indigenous energy resources are listed. Figures on the growth in energy consumption in Bangladesh and other countries are given in a couple of tables. The dedication of gas to different sectors is described. The availability of reactors of suitable size is also described as well as the cost economics involved. The financing sources are considered. 23 refs, 1 map, 7 tabs.

15890 (IAEA-TECDOC—378, pp 157-163) **Sharing of benefits and risks in regard to the establishment of nuclear power programmes in developing countries.** Darroch, I.D. (Atomic Energy of Canada Ltd., Sheridan Park, Ontario. CANDU Operations). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

The establishment of a nuclear power program in a developing country is dependent upon the needs of a number of different parties being satisfied. One key area in this regard is the structuring of a reasonable and equitable sharing of both risks and benefits. This paper is intended to provide an overview and introduction to this topic. The points to be addressed here are: the key players involved; the relationships between the players; the benefits of a nuclear power program; the sharing of benefit; the risks involved; the sharing of risks through appropriate business arrangements; some possible arrangements. Many business arrangements are possible, however the most appropriate arrangement for a specific project must take into account the needs, desires and priorities of the specific developing country whilst providing acceptable incentives and compensation to the suppliers and to the financiers. This paper does not attempt to reach a conclusion that would be applicable in each and every case, but it is intended to point out that this is a very complex area requiring a great deal of creativity and innovation in order to establish an appropriate arrangement for each case.

15891 (IAEA-TECDOC—378, pp 177-200) **Financial problems of nuclear programmes. The experience of Argentina.** Terigi, R. (Comision Nacional de Energia Atomica, Buenos Aires, Argentina). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

The experience of Argentina in planning nuclear power is expressed here in terms of technological, economic, financial, and political factors. The integration of nuclear energy, the inflationary context and the state participation in the electricity subsector are described. The risk factors are analyzed. The results achieved are listed. The new institutional situation is outlined. The role of international relations in relation to the above mentioned situation is discussed and the underlying determining factors are mentioned.

15892 (IAEA-TECDOC—378, pp 201-203) **Retrospective economic and financial analysis of the Laguna Verde Project.** Tapia Garcia, F.; Gomez Mariles, A.; Morales Galvan Duque, L. (Comision Federal de Electricidad, Mexico City). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

The objective of this paper is to show, from an economic and financial point of view, the effects of the capital expenditure

programme of the Laguna Verde Nuclear Power Plant Project on costs in terms of investment per kWh generated. An economic and a financial analysis are therefore included. Various investment periods and balanced costs are considered.

15893 (IAEA-TECDOC—378, pp 205-211) **Risk assessment from point of view of supplier.** Meyer, P.J. (Kraftwerk Union A.G., Erlangen, Germany, F.R.). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

According to this paper the risks associated with a nuclear power plant project from the point of view of the supplier can be seen mainly in the following fields: Contractual risks, technical risks, and financial risks. In this paper some points are discussed to identify the areas in which risks are expected. The paper only touches briefly on the assessment of risks from the point of view of the supplier. However, a schematic diagram of the risk assessment from the point of view of the supplier is included.

15894 (IAEA-TECDOC—378, pp 213-221) **Nuclear project finance in developing countries: The multi-country financing alternative.** Fleck, J.B. (Westinghouse Nuclear International, Brussels, Belgium). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

It is the basic contention of this paper that, because of certain factors in the financial markets, multi-country financing (MCF) is the new alternative if not the imperative for large scale and turnkey nuclear plant programs in developing countries. The point is made that its successful use depends on the ability of the host country, the credit granting countries and suppliers to both recognize the MCF reality and manage its implicit variables. Those who collectively do so will be successful, and those who cannot will not be states the author. The aspects of MCF are described.

15895 (IAEA-TECDOC—378, pp 223-227) **Sales of nuclear power stations to developing countries: Risk assessment for export credit insurance.** Ward, D.A. (Berne Union, London, UK). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

In this statement on how the export credit insurer sets about making a risk assessment begins with an explanation of what his function is and what are the risks he needs to assess. The risks covered by export credit insurers are usually considered under two heads, the commercial, related to the individual related to the individual buyer, and the political, related to the buyer's country. The emphasis with any big project is much more on the political i.e. country risk. The country risk assessment is therefore described in more detail. The author concludes that such assessments are difficult to make in particular for nuclear projects owing to the very long time span.

15896 (IAEA-TECDOC—378, pp 229-234) **Country risk evaluation by the supplier.** Lehmann, M. (Framatome, Paris La Defense, France). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

Two preliminary facts are underlined in this paper: There is no agreement on the time horizon to be considered in forecasting and planning, and there is always a gap between risks as perceived and real risks. Four possible time horizons are considered (in some detail) and compared. The conclusion is that one should concurrently consider all the time horizons discussed. Risk analysis should be studied as a "continuum". The example of Mexico is mentioned in this connection. Typical risks are listed. Methods by which these risks can be evaluated are described: Two broad conventional and two new methods. The existing methods are regarded as satisfactory but their limits are stressed.

15897 (IAEA-TECDOC—378, pp 241-244) **Nuclear power plants and project finance.** Vaissiere, P. de. (Banque Indosuez, Paris, France). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

The main characteristics of project financing are mentioned as well as different types of projects to which the techniques of financing have been applied. The issues encountered in financing medium size nuclear power plants in developing countries which distinguishes it from traditional project financing are listed and commented. As it seems difficult for commercial banks to take the risks involved in such nuclear projects the paper describes an alternative solution based on the idea that the commercial obligation be substituted by a financial obligation. An example of this is to give a concession to a private company to purchase and operate the power station in question for a given period of time and sign with this company a long term electricity purchase agreement over the same period. The merits of this set up are mentioned.

15898 (IAEA-TECDOC—378, pp 245-251) **Preparation and appraisal of electric power projects.** Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

This note is for the use of Bank staff and potential borrowers, consultants and others who may be involved in the preparation of electric power projects which may be considered for financing by the Bank and IDA. It outlines the Bank's approach to the appraisal of power projects and may be used as a general guide for the content of project feasibility studies and other information which may be needed to support the project. It emphasizes that projects should be justified as part of a least-cost system and identifies the economic criteria which is usually used in project evaluation. The paper presumes general familiarity with Bank policies and procedures and with techniques of power development programming; therefore the paper is not comprehensive and is not intended to be used as an instructional guide.

15899 (IAEA-TECDOC—378, pp 253-257) **Project financing. Financial planning model (FINPLAN).** Vanhoutteghem, P. (Credit Lyonnais, Paris, France). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

The "Project Financing" approach is summarized here in terms of four phases: Establishing a gross operating surplus profile on the basis of the lifetime of the loan, on reasonably pessimistic assumptions; Discounting; Establishing the security ratio; Calculating the guarantee value of the project. However, these broad principles cannot be applied to nuclear activities without significant adaptation. The reasons for this are stated as well as other factors of relevance in the nuclear case. At the request of the Agency, CREDIT LYONNAIS has prepared a financial planning model (FINPLAN) adapted to the nuclear sector and permitting, on the basis of input of the WASP model, measurement of the probable financial consequences of investment decisions. FINPLAN and WASP are not interactive but a successive study can be made of the alternative orders of power plant construction considered by WASP to be close to the economic and physical optimum. FINPLAN takes into account both local and foreign estimated inflation rates (on which the investment sum and the operational costs will depend) as well as fluctuations in parity (foreign currency/local currency) and will automatically calculate annual profits and losses in exchange. The model cannot, however, make an exhaustive analysis of the financial criteria. It is simply an auxiliary tool for decision making.

15900 (IAEA-TECDOC—378, pp 259-261) **OECD Consensus and loan conditions on officially supported financing for nuclear power plants.** Ray, J.E. (OECD, Paris, France. Division of Financing and Other Export Questions). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

Today, all OECD countries provide official export insurance coverage and all but one offer direct export financing support by way of direct credits, refinancing, or interest rate subsidisation. The proliferation of government export financing support programmes and the increasing competition among them provoked fear that an "export credit war" might develop and eventually led to the formulation of the OECD "Consensus" in July 1976 and the adoption in February 1978 of the "Arrangement on Guidelines for Officially Supported Export Credits". The "Arrangement" stipulates a number of guidelines to which participating countries pledge to adhere. The most important rules are mentioned in this paper. A Sector Understanding on Export Credits for Nuclear Power Plants which complements the Arrangement, was adopted on 31 July 1984 and made effective as of 18th August 1984. The principle constraints on credit terms are also mentioned in this paper. The above mentioned Understanding is new and still in its "breaking in" phase. Some time will be needed in order to tell how well its provisions will work in practice.

15901 (IAEA-TECDOC—378, pp 263-269) **Present situation of export credits.** Brodelle, J. (Banque Francaise du Commerce Exterieur, Paris, France). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

Official support in respect of financing is being increasingly criticized and even the principle of it is questioned, with the result that in the majority of exporting countries there is a tendency towards gradual government disengagement. This paper is focused on this phenomenon. The statements contained in this paper are not limited to export credits related to nuclear power plant exports as they are of the same nature as in conventional export credits. The origins of export credits are recalled. The international agreements concluded in this field are described briefly. It is shown that the terms and conditions for government involvement in export financing have undergone profound changes. The problems of the present situation are reviewed. It is concluded that the official support for financing does not appear to be under threat and the official machinery for this cannot at the present stage be competitively replaced by the new possibilities offered by the financial markets.

15902 (IAEA-TECDOC—378, pp 271-275) **Commercial bank contribution in the financing of nuclear plant export contracts.** Stakowski, R. (Credit Lyonnais, Paris, France). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

In this paper on financing the following is mentioned briefly: The export credit loan and the provision of the complementary amount of funds. A hypothetical example of the intervention of a commercial bank in the financing of a nuclear plant export contract is given. An appendix to the paper includes examples of loan conditions involving the government of Indonesia. In another appendix a possible hybrid-loan combination is described. It is concluded, however, that in the field of financing of nuclear plant export contracts the issues can only be discussed in a qualified manner if done on a case by case basis and in the light of the hypothesis taken into account in appraising the project yield and in the light of the legal structure envisaged.

15903 (IAEA-TECDOC—378, pp 277-287) **Cost and financing of nuclear power program in Turkey.** Kutukcuoglu, A. (Turkiye Elektrik Kurumu Nukleer Enerji Dairesi, Ankara). Jul 1986. NTIS (US Sales Only), PC A15/MF A01. File Number DE87700707. (CONF-850931—).

From International seminar on costs and financing of nuclear power plants in developing countries; Vienna, Austria (9 Sep 1985).

Preparatory work for the construction of the first Nuclear Power Plant (NPP) in Turkey has been continuing since 1974-1975. Upon requirement of the Turkish Government to build and operate the NPP for 15 years through a joint-venture to be established with the participation of the Utility (Turkish Electricity Authority) and the Supplier, two slightly different management and financing schemes have been developed with AECL (Canada) and KWU (Kraftwerk Union) for this model which will be exercised for the first time in the world for a nuclear project. Some of the important aspects of these two approaches are highlighted in this paper. The first joint-venture model described consists of the construction and operation of NPP by Joint-Venture Utility. The second joint-venture model described consists of the construction and operation of NPP by Joint-Venture Management Company on behalf of the Utility. Graphical illustrations of the agreements, contracts and business structure of the two models are shown. The costs, financing and cash flow in these two cases are discussed. 6 figs, 2 tabs.

15904 **(IAEA-TECDOC—383) Introduction to cost-effectiveness analysis of risk reduction measures in energy systems.** (International Atomic Energy Agency, Vienna (Austria)). Jul 1986. 70p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87701286.

The aim of this report is to introduce readers to methods of cost-effectiveness analysis and their application in risk reduction, especially in connection with the energy-producing industries. The background to the assessment of risk and the problems in estimating it quantitatively are outlined. The methodology of cost-effectiveness analysis is then described, particular attention being given to the way in which results are derived and the overall use that can be made of them. This is followed by a discussion of quantitative applications and an outline of the methods that may be used to derive estimates both of risk and the cost of reducing it. The use of cost-effectiveness analysis is illustrated in an appendix, which gives as a worked example a case study on the reduction of public risk associated with radioactive releases during normal operation of a PWR. After drawing some general conclusions the report recommends that such analyses should normally be used as an aid to risk management whenever several alternative risk reduction measures are under consideration. 36 refs, 28 figs, 14 tabs.

15905 **Nuclear decommissioning - the financial R & R problems.** Swanson, R. *Transactions of the American Nuclear Society;* **53**: 73(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

From a financial standpoint, nuclear decommissioning issues can be synthesized into two primary concerns. The first concern is that actual decommissioning costs are recovered from users of nuclear generation. The second concern - one of reliability - is that amounts so recovered are actually available in current available funds when decommissioning occurs. These concerns, of course, are not new. They have been present from the very beginning of the civilian nuclear program. The issue of recoverability has been the subject of numerous rate proceedings of electric utilities. The one constant of these proceedings has been agreement that the customers who utilize the kilowatts generated by nuclear energy should pay the rates to provide funds for decommissioning. The ratemaking issues have been (a) what amount is necessary and (b) how that amount should be provided - i.e., on a straight-line basis or some other basis such as a sinking fund methodology. The scope of this paper insofar as recoverability is concerned is limited to the latter issue. The dollar estimates will be left to engineers.

15906 **Fuel cost impacts of using constant cycle-based amortization rates.** Venkateswaran, S.R.; Park, Y.M. (NUS Corp., Rockville, MD). *Transactions of the American Nuclear Society;* **53**: 80-81(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper is concerned with amortization of nuclear fuel to expense, and analyzes the impacts of using alternative amortization methods on the nuclear fuel cycle cost, namely, use of a constant cycle-based amortization rate and use of batch-based amortization rates. Results of this comparison are summarized.

15907 **Examination of fuel reinsertion strategies for out-of core fuel management.** Comes, S.A.; Turinsky, P.J. (North Carolina State Univ., Raleigh). *Transactions of the American Nuclear Society;* **53**: 82-84(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A computer code for determining out-of-core fuel loading strategies in order to minimize levelized fuel cycle cost within constraints has been developed and previously reported by the authors. While past work in this area has dealt with optimizations during equilibrium operating conditions, this work has considered the more realistic conditions of nonequilibrium cycles. The code, called OCEON, seeks to determine a family of economically attractive fuel reload strategies through the optimum selection of feed batch sizes, enrichments, and partially burned fuel reinsertion strategies within operating constraints. This paper presents recent work on expanding the code to allow for different fuel reinsertion options when determining the family of near-optimum fuel reload strategies.

15908 **Nuclear fuel cycle variables calculation code - FUTURE.** Fukushi, S.; Murakami, S.; Furuya, K.; Funatsu, M.; Fujioka, K.; Kamata, E. *Transactions of the American Nuclear Society;* **53**: 85-86(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The development and realization of technologies related to those facilities constituting a nuclear fuel cycle, including a nuclear power plant, require a vast investment and a long-term preparation period. Consequently, in order to promote nuclear power generation, it is inevitable that well-coordinated and conformable development strategies will be established, based on long-term prospects. To meet these demands, several calculational codes have been developed and are now being utilized in planning stages. Due to advantages in nuclear power technology in recent years, however, more precise and detailed data are now necessary, and as a result these existing codes have become inadequate. Based on this background, the FUTURE (fuel cycle for total uranium resources) code has been developed to enable a more accurate long-term analysis reactor types, determination of nuclear fuel cycle variables, and economical studies of power generation costs. The system comprises the material calculation, cost calculation, and report editing programs.

15909 **Choosing the optimum burnup.** Geller, L.; Goldstein, L.; Franks, W.A. (S.M. Stoller Corp., Boulder, CO). *Transactions of the American Nuclear Society;* **53**: 104(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper reviews some of the considerations utilities must evaluate when going to higher discharge burnups. The advantages and disadvantages of higher discharge burnups are described, as well as a consistent approach for evaluating optimum discharge burnup and its comparison to current practice. When an analysis is performed over the life of the plant, the design of the terminal cycles has significant impact on the lifetime savings from higher burnups. Designs for high burnup cycles have a greater average inventory value in the core. As one goes to higher burnup, there is a greater likelihood of discarding a larger value in unused fuel unless the terminal cycles are designed carefully. This effect can be large enough in some cases to wipe out the lifetime cost savings relative to operating with a higher discharge burnup cycle.

15910 **Effects of high burnup on spent-fuel casks.** Wells, A.H. (Nuclear Assurance Corp.). *Transactions of the American Nuclear Society;* **53**: 108(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Utility fuel managers have become very interested in higher burnup fuels as a means to reduce the impact of refueling outages. High-burnup fuels have significant effects on spent-fuel storage or transportation casks because additional heat rejection and shielding capabilities are required. Some existing transportation casks have useful margins that allow shipment of high-burnup fuel, especially the NLI-1/2 truck cask, which has been relicensed to carry pressurized water reactor (PWR) fuel with 56,000 MWd/ton U burnup at 450 days of cooling time. New cask designs should consider the effects of high burnup for future use, even though it is not commercially desirable to include currently unneeded capability. In conclusion, the increased heat and gamma radiation of high-burnup fuels can be accommodated by additional cooling time, but the increased neutron radiation source cannot be accommodated unless the balance of neutron and gamma contributions to the overall dose rate is properly chosen in the initial cask design. Criticality control of high-burnup fuels is possible with heavily poisoned baskets, but burnup credit in licensing is a much more direct means of demonstrating criticality safety.

15911 **Application of systems engineering to fuel processing activities.** Aitken, E.A.; Thompson, M.L. (General Electric, Sunnyvale, CA). *Transactions of the American Nuclear Society;* **53**: 117-118(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The systems engineering process has been applied to several fuel processing tasks ranging from large, long-term fuel fabrication/reprocessing operations to a small, short-term component development in ongoing fuel production operations. These diverse applications enable one to develop a systems engineering process with flexibility, depending on the environment and the nature of the problem. This presentation describes three problems that were experienced by the authors in implementing the systems engineering process.

15912 **Prudence reviews, with hindsight.** Fakonas, A.D.; Grender-Jones, D. *Transactions of the American Nuclear Society;* **53**: 371(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper sets out the authors' views on the use of consultants by utilities in preparing for regulatory commission reviews of nuclear power plant construction projects. These views are based on the authors experience working with utilities in nuclear plant prudence reviews. Although the limited number of nuclear power plants now under construction means that prudence reviews of such projects will, within a few years, be things of the past, there is evidence that the successes of commissions and their staffs in denying recovery of significant capital expenditures by utilities is prompting increased attention on other aspects of utility activities, such as the management of power plant outages for maintenance or retrofits. The views expressed in this paper will still be relevant even after current nuclear construction projects are completed.

15913 **Nuclear power plant performance incentives established by state PUCs.** Petersen, J.C. (Nuclear Regulatory Commission, Washington, DC). *Transactions of the American Nuclear Society;* **53**: 371-372(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Performance incentives (or incentive plans, efficiency incentives) are mechanisms used by state public utility commissions (PUCs) to measure a utility's efficiency level in operating or constructing generating plants and to financially reward or penalize the utility for performance above or below established levels. The objective of incentive plans is to encourage sustained improved performance. Performance incentives are applicable to the construction or operation of about 37 nuclear power reactors owned by 25 utilities in 15 states. Several additional states are considering nuclear plant incentives. The US Nuclear Regulatory Commission (NRC) Office of State Programs tracks nuclear power plant performance incentives and provides periodic reports to NRC program offices and regional offices because of the staff's concerns that some incentives may have impacts on safe construction or operation of a plant. The periodic, updated reports cover new and revised incentives applicable to specific nuclear plants and report on experience with existing incentive plans. This paper (a) discusses the NRC staff's concerns about possible or potential safety effects of incentives, and (b) summarizes results of the staff's tracking of the incentives.

15914 **Nuclear rate regulation.** Nandy, F.R.; Klapka, P.B. (Southern California Edison Co.). *Transactions of the American Nuclear Society;* **53**: 372-373(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In recent years, as nuclear power projects have been completed and entered into rates, regulatory agencies such as state public utilities commissions and the Federal Energy Regulatory Commission have increased their examination of utility nuclear power plant construction and management. Southern California Edison (SCE) formed the Nuclear Rate Regulation Organization to serve as the clearinghouse for nuclear rate information to respond to this increased attention from the regulatory agencies. The primary purpose of the organization would be to provide consistency of information and policy to be submitted to regulatory agencies. This information supporting ratemaking activities consists of preparation and justification of the following: 1) operation and maintenance expenses; 2) capital plant addition expenses; 3) energy forecast and fuel expenses; 4) plant operation and outages; and 5) support of other special regulatory investigations.

15915 **Schedule reconciliation tests for management prudency determination.** Howell, G.E. *Transactions of the American Nuclear Society;* 53: 373(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The prudency audit of a nuclear project involves engineering, construction, financial, and management dimensions. The audit must retrospectively evaluate the decisions and actions of management decision makers and then equitably allocate the cost impacts of those decisions and actions in a comprehensive and objective manner. In most situations, determination of the impact of schedule delays is a paramount issue. Manzi & Associates uses an approach to schedule reconciliation that focuses on the site-specific, as-built condition. The as-built schedule model is analyzed by a backward pass, or but-for methodology which focuses on the causes and impacts of identified delays. The objective is to demonstrate that but-for the identified delay, the project could have been built in the as-planned time frame. The but-for methodology has been used in many contract dispute cases and is currently being applied to schedule reconciliation on several nuclear plants. The potential for applying this methodology to both new construction and retrofit projects is great.

15916 **Utility prudency issues.** Charnoff, G. *Transactions of the American Nuclear Society;* 53: 373-375(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The conventional legal standard of prudence found in the common law of public utility regulation precludes a judgment about past decisions based on present knowledge of whether the decisions proved in time to have been right or wrong. The proper inquiry is not whether every management decision proved to be correct. Rather, the proper inquiry as stated by the New York Public Service Commission in Re Consolidated Edison Co. of New York, Inc. is ...whether the company's conduct was reasonable at the time, under all of the circumstances, considering that the company had to solve its problems prospectively.... The exercise of prudence does not guarantee performance on schedule or within budget, or the making of correct decisions, when judged after the fact. But it does require or involve the exercise of reasoned decision making within a framework of reasonably available alternatives.

15917 **Organization and management of heterogeneous, dispersed data bases in nuclear engineering.** Eastman, C.M. (Carnegie-Mellon Univ., Pittsburgh, PA). *Transactions of the American Nuclear Society;* 53: 382(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Large, complex, multiperson engineering projects in many areas, nuclear, aerospace, electronics, and manufacturing, have inherent needs for coordination, control, and management of the related engineering data. Taken in the abstract, the notion of an integrated engineering data base (IED) for such projects is attractive. The potential capabilities of an (IED) are that all data are managed in a coordinated way, are made accessible to all users who need it, allow relations between all parts of the data to be tracked and managed, provide backup, recovery, audit trails, security and access control, and allow overall project status to be monitored and managed. Common data accessing schemes and user interfaces to applications are also part of an IED. This paper describes a new software product that allows incremental realization of many of the capabilities of an IED, without the massive disruption and risk.

15918 **Development of a microcomputer data base of manufacturing, installation, and operating experience for the NSSS designer.** Borchers, W.A.; Markowski, E.S. (Combustion Engineering, Inc.). *Transactions of the American Nuclear Society;* 53: 385(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Future nuclear steam supply systems (NSSSs) will be designed in an environment of powerful micro hardware and software and these systems will be linked by local area networks (LAN). With such systems, individual NSSS designers and design groups will establish and maintain local data bases to replace existing manual files and data sources. One such effort of this type in Combustion Engineering's (C-E's) NSSS engineering organization is the establishment of a data base of historical manufacturing, installation, and operating experience to provide designers with information to improve on current designs and practices. In contrast to large mainframe or minicomputer data bases, which compile industry-wide data, the data base described here is implemented on a microcomputer, is design specific, and contains a level of detail that is of interest to system and component designers. DBASE III, a popular microcomputer data base management software package, is used. In addition to the immediate benefits provided by the data base, the development itself provided a vehicle for identifying procedural and control aspects that need to be addressed in the environment of local microcomputer data bases. This paper describes the data base and provides some observations on the development, use, and control of local microcomputer data bases in a design organization.

15919 **Looking out for common cause failures.** Crellin, G.L.; Mott, J.E.; Smith, A.M.; Worledge, D.H. *Transactions of the American Nuclear Society;* 53: 389-390(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Common cause failures (CCFs) have been a continuing concern in nuclear plant operation; first, because they do occasionally occur, and second, because probabilistic risk assessment studies indicate that CCFs are potentially significant risk contributors due to the success of defenses against multiple, independent failures. A comprehensive Electric Power Research Institute, (EPRI) study of CCFs has (a) developed a well-defined classification system for analyzing fault events, and (b) studied licensee event report data for the auxiliary feedwater system (AFWS) and reactor protection system (RPS) using this classification system and analysis of root cause, failure modes, detection methods, corrective actions, and defensive measures. In this work, the confusion generally encountered with the definition of CCF has been resolved by directing attention to branched events - i.e., any event in which a root or component cause resulted in concurrent, multiple unavailabilities (either physical failure or functional unavailability). The current emphasis in the EPRI project is on defensive measures against branched events. This paper discusses some preliminary project results.

15920 **Nuclear power and economics: keys to continuing progress.** Leclercq, J. (Electricite de France's, Paris). *Transactions of the American Nuclear Society;* 53: 433-434(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Today, Electricite de France's (EdF's) chief concern is to keep close check on the performance and economics of its nuclear power reactors and to prepare for the future. The practice of building power plants in series and on a large scale has involved special constraints. This is true in particular of the pressurized water reactor series, which includes 39 standardized 900- and 1300-MW units with a total capacity of 37,000 MW. This paper deals with the areas on which EdF is currently focusing its development efforts.

15921 **Striving for excellence.** Vaughn, G.E. (Duke Power Co., Charlotte, NC). *Transactions of the American Nuclear Society;* **53**: 434-435(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

With guidance and assistance from the Institute of Nuclear Power Operations (INPO), nuclear utilities are striving for excellence by making steady improvements in industry performance indicators. Duke Power Company has solidly committed to support the industry's effort to obtain higher standards of excellence. Dedicated, highly trained employees, who are motivated to making it happen, carry out this commitment within a management framework which includes: 1) top management support and direct involvement; 2) a strategy to achieve excellence over the long run; 3) a nuclear management priority structure; and 4) a goals program.

15922 **New approaches to performance-based project management training.** Spitulnik, J.J.; Rath, W.R. (Cygna Energy Services, Boston, MA). *Transactions of the American Nuclear Society;* **53**: 65-66(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Installing modifications to a nuclear generating facility present challenges beyond the engineering and design tasks necessary to fix the problem. Starting with problem identification, every engineering task associated with a modification, every engineering task associated with a modification can be complemented with a dozen nonengineering tasks. It is not unusual for these other tasks to represent most of the time and much of the money devoted to a modification. Modification process workshops prepared for nuclear utilities have proven successful in providing a foundation on which engineers can build their expertise in performing plant modifications. This paper describes these programs. Three types of modification workshops have been developed to provide these process skills. The first was for recent engineering graduates and was prepared in conjunction with a 6-week engineering training program that included basic training on plant technology, regulatory agencies, and codes and standards. The second program was for seasoned engineers and technicians who worked for a utility that just implemented a new modification control process. The third program was developed for the central design organization of a multiplant utility. This organization is responsible for managing modifications at all of the utility's nuclear plants, and the students were experienced engineers who were either new to the company or transferred from other departments.

15923 **Monitor III.** Grisham, D.L.; Lambert, J.E. (Los Alamos National Lab., NM). *Transactions of the American Nuclear Society;* **53**: 509(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Monitor III is a totally portable version of the Monitor I and II systems in use at the Clinton P. Anderson Meson Physics Facility (LAMPF) since 1976. The Monitor III system differs from the other systems in that it is capable of operating in any location accessible by truck. Although Monitor III was designed primarily for the handling and disposal of radioactive materials, it is also capable of performing the more sophisticated operations normally performed by the other Monitor systems. The development and operational capabilities of the Monitor remote handling system have been thoroughly reported since 1978. This paper reports on the commissioning of a new system with unique capabilities.

REFER ALSO TO CITATION(S) 15963, 16164, 16448, 16620

15925 **(EIR—601) Digital generation of stochastic signals of arbitrary spectral shape.** Behringer, K.; Nishihara, H.; Spiekerman, G. (Eidgenoessisches Inst. fuer Reaktorforschung, Wuerenlingen (Switzerland)). Oct 1986. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700692.

For computer-simulation experiments in the development of noise monitoring systems three methods of generating ergodic Gaussian random noise with specified spectral properties have been investigated: digital filtering of white noise optimum symmetric FIR filters, a modified Rice formulation and an approximation of the Kac representation of noise. The proposed modified Rice formulation is a new noise generation method which is most efficient with regard to the computation time. By windowing subsequent Rice sequences a smooth noise record of any desired length can be produced.

From Workshop on spectrometry and in core dosimetry of neutron radiation; Rez, Czechoslovakia (20 Mar 1985).

The most important methods are briefly described of solving the Boltzmann equation describing neutron transport, such as are used at UJV Rez. These are the methods of P/sub N/-approximation, the S/sub N/ method, further the Monte Carlo method and the moments method in which the solution of the Boltzmann equation describing the spatial and energy distribution of neutron flux density proceeds from the system of equations given by the P/sub N/-approximation. It is emphasized that the results are loaded with a big error or are totally erroneous when inaccurate cross sections or unsuitable libraries of cross sections are used. (J.P.).

From Workshop on spectrometry and in core dosimetry of neutron radiation; Rez, Czechoslovakia (20 Mar 1985).

Special procedures have been developed for fast computations with modest demands on computer memory. The principle underlying the so-called removal method is the multigroup approach, separation of primary fluxes and their calculation using the integration of point kernels. Included in the primary fluxes are nonscattered neutrons and small-angle scattered neutrons. Primary flux neutrons are the source for solving scattered radiation fluxes which are calculated in the diffusion approximation or in the P/sub 1/-approximation. A number of one- and two-dimensional programs have been written based on these methods. The determination is described of cross sections and group constants, and problems of numerical calculations and the method of kernels are dealt with. Macrocomputations of the reactor core are performed by few-group diffusion programs (the BIPR, MOBY-DICK codes), computations of spectra in cells by MICROS, MICROBE-02 program packages. Sources of errors in the calculation of shielding are given. (J.P.).

15928 **Parity simulation for nuclear plant analysis.** Hansen, K.F.; Depiente, E. (Massachusetts Institute of Technology, Cambridge). *Transactions of the American Nuclear Society;* **53**: 250-251(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The analysis of the transient performance of nuclear plants is sufficiently complex that simulation tools are needed for design and safety studies. The simulation tools are needed for design and safety studies. The simulation tools are normally digital because of the speed, flexibility, generality, and repeatability of digital computers. However, communication with digital computers is an awkward matter, requiring special skill or training. The designer wishing to gain insight into system behavior must expend considerable effort in learning to use computer codes, or else have an intermediary communicate with the machine. There has been a recent development in analog simulation that simplifies the user interface with the simulator, while at the same time improving the performance of analog computers. This development is termed parity simulation and is now in routine use in analyzing power electronic network transients. The authors describe the concept of parity simulation and present some results of using the approach to simulate neutron kinetics problems.

15929 **GPT methods for fuel evolution and shuffling studies.** Gandini, A. *Transactions of the American Nuclear Society;* 53: 251-253(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Extension of the heuristically based generalized perturbation theory (GPT) methodology to neutron-nuclide evolution analysis in nuclear reactor systems has been already demonstrated. A calculational scheme related to this methodology is here described, by which standard available GTP codes can be adopted. The use of GPT techniques for fuel shuffling studies is also described.

15930 **System reliability analysis via generalized perturbation theory methods.** Gandini, A. *Transactions of the American Nuclear Society;* 53: 265-266(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the probabilistic analysis of systems, a key point is identification of the important components. Such identification is in fact required in assisting the analyst to find weaknesses in design and operation and in suggesting optimal modifications for system upgrade. A number of methods have been suggested so far to evaluate the importance of basic components, generally based on the well-known Birnbaum's importance concept. A sensitivity methodology, mainly concerned with basic component parameters, is proposed here in relation to the Markov chain model and based on importance concepts widely used so far in nuclear reactor physics.

15931 **Feedback simulation of ramped power transients using transfer functions.** Grimm, K.N.; Meneghetti, D. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* 53: 460-462(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The dynamic simulation of reactor transients is important in determining the feedback and temperature responses of various subassembly components. One method of determining component feedbacks (or associated temperature increments) is by using the feedback reactivity transfer functions of the system. For any variation of power with time the component feedback reactivity responses are then obtained by the convolutions of the feedback reactivity transfer functions and the fractional change in system power. (The nodal feedback reactivity transfer functions for the system were obtained, using the EROS computer code, from nodal feedback responses for a step change in power.) This paper discusses the application of these transfer functions in calculating nodal feedback reactivities in the experimental breeder reactor-II (EBR-II) reactor assuming a fractional power shape that can be defined by a series of ramp inputs. For a comparison, these transfer-function calculated nodal reactivities are compared with nodal reactivities calculated using the EROS kinetics code assuming an input reactivity which gives the described ramp power shape.

15932 **PPC - an interactive preprocessor/compiler for the DSNP simulation language.** Mahannah, J.A.; Schor, A.L. (Massachusetts Institute of Technology, Cambridge). *Transactions of the American Nuclear Society;* 53: 42-43(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The PPC preprocessor/compiler was developed for the dynamic simulator for nuclear power plant DSNP simulation language. The goal of PPC is to provide an easy-to-use, interactive programming environment that will aid both the beginner and well-seasoned DSNP programmer. PPC simplifies the steps of the simulation development process for any user. All will benefit from the on-line help facilities, easy manipulation of modules, the elimination of syntax errors, and the general systematic approach. PPC is a very structured and modular program that allows for easy expansion and modification. Written entirely in C, it is fast, compact, and portable. Used as a front end, it greatly enhances the DSNP desirability as a simulation tool for education and research.

15933 **Graduate student use of DSNP at Idaho State University.** Larson, H.A.; Charyulu, V.P. (Idaho State Univ., Pocatello). *Transactions of the American Nuclear Society;* 53: 43-44(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Several projects were assigned to graduate students at Idaho State University (ISU) involving the dynamic simulator for nuclear power plants (DSNP) computer language. These projects either led, or are intended to lead, to master's degrees in nuclear science. The studies were all performed using the latest version of DSNP installed in Argonne National Laboratory's (ANL's) IBM 3033 computers in Argonne, Illinois. The projects described here were educationally useful in that they provided the following: 1. an engineering learning experience; 2. students had the opportunity to solve the problem of representing physical descriptions and experimental data with numerical simulation; 3. mutually beneficial interaction between the graduate students and ANL scientists; 4. some financial and equipment support for the students; and 5. in one case, the base study for the development of a master's thesis.

15934 **Special simulation programs generated by DSNP for educational uses.** Madell, J.T. *Transactions of the American Nuclear Society;* 53: 44-45(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The DSNP (dynamic simulator for nuclear power plants) language is a high-level simulation language whose translator writes FORTRAN programs for reactor system transient analyses. The high-level character of DSNP greatly facilitates the generation of FORTRAN programs, which may then be duplicated on floppy disks for execution on personal computers (PCs). A student's understanding of reactor dynamic principles may be enhanced by running extensive parametric studies as either a classroom or special project exercise. This DSNP capability was demonstrated, in principle, by the simulation of an entire primary system in a program that was modified, down-loaded, and run on a microcomputer. The demonstration uncovered two drawbacks: extensive editing of the DSNP-generated FORTRAN program for consistency with microcomputer software and long running times on the PC. The DSNP translator was recently revised to produce programs consistent with the microcomputer software. Elimination of the second drawback is the subject of this paper.

15935 **Input and control management scheme for the DSNP simulation language.** Mesman, L.M.; Meneley, D.A. (Univ. of New Brunswick, Fredericton). *Transactions of the American Nuclear Society;* 53: 50-51(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The simulation language identified as the dynamic simulator for nuclear plants (DSNP) provides a flexible powerful framework from which to construct transient simulation models. This capability is very important to a university department involved in the teaching of nuclear engineering at the undergraduate and graduate levels. However, the educational environment also includes restraints; few of the potential users are experienced in computer usage. Even for experienced users, preparation of input for a typical transient simulation is an onerous task that is susceptible to error. Reference to printed documentation becomes a lengthy proc-

ess. The flexibility of a package such as DSNP also carried a penalty - the user must properly define relationships among all components of the problem as well as the computational procedures for its solution in the form of a simulation driver routine in a special language with its own syntax. For these reasons, a development project was undertaken at the University of New Brunswick with the goal of simplifying the DSNP input structure and providing features to reduce input error rates.

15936 **Nuclear thermal-hydraulics education: the Yankee Atomic/University of Lowell experience.** Husain, A.; Brown, G.J.; Yeung, W.S. (Yankee Atomic Electric Co.). *Transactions of the American Nuclear Society;* **53**: 53(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper summarizes the long and meaningful relationship between the University of Lowell (UL) and Yankee Atomic Electric Company (YAEC) in the area of nuclear thermal hydraulics. The UL has actively interacted with YAEC for many years. Many UL graduates from the nuclear program as well as health physics and other disciplines are employed by YAEC. Furthermore, many students have worked for YAEC on a part-time basis through summer employment or the coop program. Several graduate students have completed their thesis work under the joint direction of UL and YAEC personnel, and some faculty members have had consulting and research contracts with the company. At the same time, YAEC employees have taken advantage of the graduate program offered by UL and have earned advanced degrees. Some YAEC personnel have taught courses at UL and have served on the industrial advisory committees.

15937 **Thermal hydraulics in undergraduate nuclear engineering education.** Theofanous, T.G. (Univ. of California, Santa Barbara). *Transactions of the American Nuclear Society;* **53**: 53-54(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The intense safety-related research efforts of the seventies in reactor thermal hydraulics have brought about the recognition of the subject as one of the cornerstones of nuclear engineering. Many nuclear engineering departments responded by building up research programs in this area, and mostly as a consequence, educational programs, too. Whether thermal hydraulics has fully permeated the conscience of nuclear engineering, however, remains yet to be seen. The lean years that lie immediately ahead will provide the test. The purpose of this presentation is to discuss the author's own educational activity in undergraduate nuclear engineering education over the past 10 yr or so. All this activity took place at Purdue's School of Nuclear Engineering. He was well satisfied with the results and expects to implement something similar at the University of California in Santa Barbara in the near future.

15938 **Thermal hydraulics in nuclear engineering at UIUC.** Jones, B.G. (Univ. of Illinois, Urbana). *Transactions of the American Nuclear Society;* **53**: 54-55(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Department of Nuclear Engineering at the University of Illinois, Urbana-Champaign, has a broad-based series of courses and research studies in nuclear thermal hydraulics and related areas. In order to sustain a viable series of courses from introductory undergraduate through advanced graduate levels, a mixture of courses, some taught within the department and some offered by other engineering departments, is used. This conserves faculty teaching time and maintains sufficient class enrollments to provide a regular offering schedule.

15939 **Green's function for the evaluation for neutron cross sections.** Stevenson, B. (New Jersey Institute of Technology, Newark). *Transactions of the American Nuclear Society;* **53**: 58-59(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The author develops a Green's function for the evaluation of neutron cross sections as illustrated by an example which also provides a check of the validity of the procedure described.

15940 **USNY college degrees: three successful collaborations to fulfill NRC requirements.** Headley-Walker, L.; DeSain, G. (Univ. of the State of New York, Albany). *Transactions of the American Nuclear Society;* **53**: 63-64(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Within the last few years, an evident need has surfaced in the nuclear industry regarding the necessity for degreed individuals on shift. While nuclear utility management has attempted to accommodate this direction in a variety of ways, none is as unique as the collaborative model developed by the University of the State of New York (USNY) Regents College Degrees (RCDs). This paper reviews USNY's collaborative efforts to provide degree programs for senior reactor operators to utilities and presents three models for degree completion used at Maine Yankee Nuclear Power Plant, New York Power Authority, and Pacific Gas & Electric. Several other utilities are utilizing the collaboration model, and while these are not discussed in detail, information about their progress is available.

15941 **University papers in American Nuclear Society (ANS) transactions with enrollment and degrees-III.** Duffey, D.; Wiggins, P.F. (Univ. of Maryland, College Park). *Transactions of the American Nuclear Society;* **53**: 64-65(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Statistics on nuclear engineering course offerings, enrollment, degrees, and papers published in the American Nuclear Society (ANS) Transactions were presented in 1966 at a conference at the University of West Virginia and in several subsequent publications. Since the 1970s, enrollment and degree data have been compiled by the US Department of Energy and its predecessors. These are the latest statistics. Universities, with perhaps 300 professors of nuclear engineering, continue to contribute substantially to the Transactions. Identification of nuclear engineering at universities is suffering because of reduced enrollment and much less graduate research support. This and the foreign student situation deserve serious attention by those concerned with nuclear engineering in university, government, and industrial communities.

15942 **Diversion cross-flow mixing at the inlet of a simulated rod bundle using a gamma camera.** Sedaghat, A.; Macduff, R.; Castellana, F. (Columbia Univ., New York, NY). *Transactions of the American Nuclear Society;* **53**: 534-535(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The prediction of diversion cross-flow and turbulent mixing interests reactor vendors and nuclear fuel suppliers because of the effect on critical heat flux. In single-phase flow with uniform inlet conditions, flow diversion occurs primarily near the inlet. Prior work by Bowring and Levy and Lahey estimated diversion length by comparing the axial pressure differential at the channel exit using isokinetic (natural flow split) and nonisokinetic (forced flow split) sampling and by using a mathematical model. The present work, sponsored by Exxon Nuclear Company, Inc., represents the first study in which flow distribution and diversion cross flow were investigated at the inlet of a clean geometry. The parameters investigated were diversion length and the effective cross-flow velocity was determined by analysis. The results of this work were compared to theoretical values predicted by the COBRA IIIC subchannel computer code. The difference between experimental data and COBRA IIIC suggests that a more comprehensive transverse momentum balance is desired as mass flux ratios become large. The inclusion of transverse inertia and acceleration terms in the transverse momentum balance become important.

15943 **DNB prediction in assemblies with mixing vanes and unheated tubes.** Weisman, J.; Lim, J.C.; Ying, S.H. (Univ. of Cincinnati, OH). *Transactions of the American Nuclear Society;* **53**: 548-549(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the current study, the Weisman-Pei predictive procedure is applied to departure from nucleate boiling (DNB) data obtained with heater-rod assemblies having mixing vanes attached to the support grids. The data first chosen for examination were obtained in six tests of 16- and 25-rod electrically heated bundles. The tests covered three different mixing vane grids, two rod diameters, included both uniform and nonuniform axial heat fluxes and rod lengths from 2.4 to 4.3 m. Pressure ranged from 103 to 166 bar, mass flux from 4.8 to 17.6 kg/m^2 h and the average void fraction at the DNB location was below 0.65. The data analysis allowed for the effect of the mixing vanes by appropriately increasing the mixing coefficient used by COBRA. The prediction procedure remained unchanged otherwise.

15944 (EPRI-CS—4748, pp 1.65-1.84) **Nuclear power station predictive on condition analysis program for rotating machinery.** Nicholls, R.E. (Virginia Electric and Power Company, Richmond). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

This presentation is designed to introduce to the generating utilities what is perhaps the finest opportunity to enhance major production related, rotating equipment reliability and the generating units availability, more than any single entity within our power, but there are keys to its success. The description of administrative structuring, coupled with the state of the art in spectrum analyzers, computers and other support equipment used in aiding discrete frequency analysis, is the foundation of this technology. 6 figures.

15945 (EPRI-CS—4748, pp 4.135-4.159) **Acoustic leak detection in nuclear power plants.** McElroy, J.W. (Philadelphia Electric Co., PA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

For several years now, utilities have been utilizing acoustic leak detection methods as an operating tool in their nuclear power stations. The purpose for using the leak detection system at the various stations vary from safety, ALARA, improved operations, preventive maintenance, or increased plant availability. This paper describes the various acoustic techniques and their application. The techniques are divided into three categories: specific component leakage, intersystem leakage, and pipe through-wall crack leakage. The paper addresses each category in terms of motivation to monitor, method of application and operation, and benefits to be gained. Current requirements are reviewed and analyzed with respect to the acoustic techniques. The paper shows how acoustic leak detection is one of the most effective leak detection tools available. 9 figures, 1 table.

15946 (EPRI-CS—4748, pp 5.1-5.9) **Reactor coolant pump seal leakage monitoring.** Stevens, D.M.; Spencer, J.W.; Morris, D.J.; James, W.; Shugars, H.G. (Babcock & Wilcox, Lynchburg, VA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

Problems with reactor coolant pump seals have historically accounted for a large percentage of unscheduled outages. Studies performed for the Electric Power Research Institute (EPRI) have shown that the replacement of coolant pump seals has been one of the leading causes of nuclear plant unavailability over the last ten years. Failures of coolant pump seals can lead to primary coolant leakage rates of 200-500 gallons per minute into the reactor building. Airborne activity and high surface contamination levels following these failures require a major cleanup effort and increases the time and personnel exposure required to refurbish the pump seals. One of the problems in assessing seal integrity is the inability to accurately measure seal leakage. Because seal leakage flow is normally very small, it cannot be sensed directly with normal flow instrumentation, but must be inferred from several other temperature and flow measurements. In operating plants the leakage rate has been quantified with a tipping-bucket gauge, a device which indicates when one quart of water has been accumulated. The tipping-bucket gauge has been used for most rainfall-intensity monitoring. The need for a more accurate and less expensive gauge has been addressed. They have developed a drop-counter precipitation sensor has been developed and optimized. The applicability of the drop-counter device to the problem of measuring seal leakage is being investigated. If a review of system specification and known drop-counter performance indicates that this method is feasible for measuring seal leak rates, a drop-counter gauge will be fabricated and tested in the laboratory. If laboratory tests are successful the gauge will be demonstrated in a pump test loop at Ontario Hydro and evaluated under simulated plant conditions. 3 references, 2 figures.

15947 (EPRI-CS—4748, pp 5.11-5.34) **Monitoring and diagnostic system for reactor coolant pump seals.** Stevens, D.M.; Spencer, J.W.; Morris, D.J.; Glass, S.W.; Sommerfield, G.A.; Harrison, D. (Babcock & Wilcox, Lynchburg, VA). Oct 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920073. (CONF-8410452—).

From 2. EPRI incipient-failure detection conference; Lake Buena Vista, FL, USA (10 Oct 1984).

The Babcock & Wilcox Company has developed and implemented a Reactor Coolant Pump Monitoring and Diagnostic system (RCPM & DS). The system has been installed at Toledo Edison Company's Davis-Besse Nuclear Power Station Unit 1 where it continuously monitors a number of indicators of pump performance. The RCPM & DS notifies the plant operator of out-of-tolerance conditions or pump performance trending toward out-of-tolerance conditions. Pump seal parameters being monitored include pump internal pressures, temperatures, and flow rates. Rotordynamic performance and plant operating conditions are also measured with a variety of dynamic sensors. This paper describes the implementation of the system and the results of on-line monitoring of four RC pumps. 4 references, 14 figures, 1 table.

15948 **(EPRI-NP—4222-Vol.3) Compilation of corrosion data on the CAN-DECON process: Volume 3, Influence of the CAN-DECON process on stress corrosion cracking: 1984 constant-extension-rate tests: Final report.** King, P.J.; Warr, B.D. (Ontario Hydro, Toronto (Canada). Research Div.; Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. 49p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920215.

Constant extension rate stress corrosion testing was performed to determine if exposure to CAN-DECON decontamination solvent would change the SCC susceptibility of sensitized type 304 stainless steel. Specimens that had been subjected to decontamination treatments of 20, 100, and 500 h were tested at 287°C in high purity water containing 200 ppB O_2 at strain rates from 10^{-7} to 10^{-6} sec^{-1}. Compared to non-decontaminated control specimens there was no observed effect of CAN-DECON treatments of 20 or 100 h. Only samples exposed to CAN-DECON from 500 h indicated an increased SCC susceptibility. Possible contributing factors to this effect are shallow intergranular attack and surface chemistry changes, although their roles were not substantiated in this work. Specific conclusions regarding the effect of CAN-DECON on the SCC susceptibility of in-service BWR piping could not be drawn from this work.

15949 (INIS-mf—10554, pp 97-102) **Monitoring radiation damage of reactor structural materials.** Brumovsky, M. (Skoda, Plzen, Czechoslovakia. Zavod Energeticke Strojirenstvi). 1985. (In Czech). NTIS (US Sales Only), PC A06/MF A01. File Number DE87700735. (CONF-8503268—Pt.1).

From Workshop on spectrometry and in core dosimetry of neutron radiation; Rez, Czechoslovakia (20 Mar 1985).

The effects are described of neutrons on the material of the pressure vessel. The most important change in the properties of the material is radiation embrittlement and radiation hardening. The effect of parameters of the neutron field is assessed, i.e., the neutron energy spectrum and total neutron fluence. The procedure of evaluation of radiation damage to the material of the pressure vessel is shown on a diagram. (E.S.).

15950 **Welding nuclear plant components.** Zeuthen, A.W. (LILCo, Shoreham, England). *Transactions of the American Nuclear Society;* **53**: 211-212(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

More than 100 nuclear plants have been constructed and are operating in the US. From the safety standpoint and for a minimum of outage time, the welding of nuclear components must be of the highest quality. During construction, automatic welding was successfully used at a number of sites. As operating plants have functions for a number of years, radiation levels have increased to the extent that exposure of welding personnel must be limited. This paper covers new advances in welding for the repair of the nuclear components.

15951 **Analyses of solid-state track recorder pressure vessel neutron dosimetry.** Ruddy, F.H.; Seidel, J.G.; Manhardt, A.E. (Westinghouse Research & Development Center, Pittsburgh, PA). *Transactions of the American Nuclear Society;* **53**: 398-399(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The preparation and deployment of neutron dosimeters based on the measurement of neutron-induced fission rates using solid-state track recorders have been described previously. Dosimetry sets containing ultra-low-mass fissionable deposits of ^{235}U, ^{238}U, ^{237}Np, and ^{239}Pu have been placed in the reactor cavity region of a number of operating commercial power reactors to obtain neutron dosimetry data that can be used to deduce the radiation exposure to the reactor pressure vessel (RPV). These measurements and other dosimetry results are used to calculate the resulting radiation damage to ensure safe operation of the RPV.

15952 **Motor-operated valve operability verification and trending from the motor control center.** Charbonneau, A.G. *Transactions of the American Nuclear Society;* **53**: 438(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Until recently, any maintenance or operational changes made to a motor-operated valve (MOV) raised questions regarding the operability of the valve during subsequent maximum differential pressure conditions. To respond to these concerns, in many cases, signature analysis performed at the MOV was necessary to verify operability. Elimination of this detailed testing was the goal of the developments described in this paper. The testing program demonstrated that a motor load (power) signal could be obtained and calibrated to maximum allowable MOV operating conditions during the baseline testing. The motor load signal proved to be far superior to motor current since it was more sensitive to load variations, could be reproduced more accurately (+/-3%), and was independent of typical plant voltage variations.

15953 **Correlation technique for single- and two-phase pump data.** Bozoian, M. (Los Alamos National Lab., NM). *Transactions of the American Nuclear Society;* **53**: 526-528(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Generalizing, a quadratic single-phase homologous head equation for two-phase provides a means of correlating single- and two-phase data into two quadratic homologous equations void-dependent coefficients that can be polynomial functions of degree n. In addition to conveniently condensing large amounts of single- and two-phase data into two relatively simple algebraic equations, this new correlation also demonstrates that homologous and void fraction dependencies are, in general, not separable for two-phase pump flow.

15954 **Efficiencies of CSP plans in quality control.** Bement, T.R.; Bryson, M.C. (Los Alamos National Lab., Los Alamos, NM 87545). pp 355-361 of Proceedings of the 38th annual quality congress. Milwaukee, WI; American Society for Quality Control (1984). (CONF-840569—).

From 38. ASQC annual quality congress; Chicago, IL, USA (14 May 1984).

Continuous sampling plans such as the Dodge CSP-3 plan are often used to obtain high quality at low QC cost. In CSP-3 individual production line items are at first inspected at a 100% level. If several consecutive items are found to have no defects, the plan calls for dropping into a sampling mode where some fraction of items from the line are inspected. If a defect is found, than a temporary 100% inspection mode is adopted where some number of items (fixed at four by Dodge) is inspected; if there is a defect among them, then the plan calls for going back to 100% inspection. Conventional CSP-3 analysis calls for the four items in the temporary 100% inspection mode to be selected as a batch and inspected in toto. With production-line sampling, a reasonable alternative is to inspect them one at a time and revert to 100% sampling as soon as one of them is found to be defective. This paper investigates the effect on cost and on outgoing quality of the different modes of operation. Whether this kind of CSP plan makes sense economically depends on the pattern of production defects. The plan is specifically designed to provide protection against a production pattern that causes some clustering of defects. Some Monte Carlo simulations are used to investigate the kinds of patterns that can economically be countered by use of a CSP-3 type plan. Consideration include the pattern of defects, the parameters of the plan (including the number of items in temporary 100% inspection, which could vary from four), and the relative costs of inspecting items and passing defective ones.

2203 Fuel Elements

15955 **(BARC—1250) Computerised automatic pellet inspection unit for FBTR fuel.** (Bhabha Atomic Research Centre, Bombay (India)). 1984. 24p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701247.

Physical inspection and certification of nuclear reactor fuel element components is an activity demanding utmost imagination and skill in devising accurate measuring systems. There is also need for remote handling, automation, rapid processing and inspection data print out when dealing with reactor fuel material. This report deals with an automatic computerised fuel pellet inspection system that has been developed in Radiometallurgy Division, B.A.R.C. to carry out dimensional and weight measurements on fuel pellets for the Fast Breeder Test Reactor (FBTR) at Kalpakkam near Madras. The system consists of several subsystems each developed especially for a specific purpose and as such items are not available off the shelf from manufacturers in India. If a general approach is adopted towards the report, there are many innovations and ideas that can be used in the automatic inspection of a variety of products in industry. As the system is fairly involved the report does not attempt to deal with detailed description of the equipment. The function of the system is to accept a certain quantity of fuel pellets in a bowl feeder, separate the pellets rejected owing to their exceeding dimensional and weight limits and form columns of accepted pellets. Dimensional and weight limits can be set as required and all inspection data are presented in a printed format. The system processes pellets at the rate of 15 per minute. The entire system can be run by operators with no special skills. The unit is currently in use for the inspection of mixed carbide fuel pellets for FBTR. 7 figs.

15956 **Integral fuel burnable absorber experience in two- and three-loop cores.** Simmons, R.L.; Jones, N.D.; Pritchett, J.E.; Mueller, D.E.; Popa, F.D. (Westinghouse Electric Corp., NFD, Pittsburgh, PA). *Transactions of the American Nuclear Society;* **53**: 88-89(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of this paper is to describe the planned use of an integral fuel burnable absorber (IFBA) in two demanding loading patterns. The IFBA used in a thin boride coating on the surface of the fuel pellet. Typically, ~30% of the fuel rods in an assembly contain coated pellets. The first loading pattern is for a three-loop core that has twice-burned fuel in all baffle locations except for one location in the eighth core. The second pattern is for a two-loop core, annual cycle. IFBAs have been successfully used in difficult two- and three-loop very low leakage loading patterns. These patterns would not have been possible with discrete burnable absorbers. Even if discrete burnable absorbers could have been used, the cycle length would have been shorter than it will be with the patterns that use IFBAs.

15957 **Fuel/cladding chemical interaction correlation for mixed-oxide fuel pins.** Lawrence, L.A. (Westinghouse Hanford, Richland, WA). *Transactions of the American Nuclear Society;* **53**: 213-215(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A correlation was developed relating the depth of fuel/cladding chemical interaction (FCCI) to fabrication and operating parameters for uranium-plutonium oxide fuel pins with 20% cold-worked Type 316 stainless steel cladding. The data base for the FCCI correlation included all the Hanford Engineering Laboratory reference oxide fuel pins irradiated in experimental Breeder Reactor-II. Previous FCCI correlations were based on smaller numbers of fuel pins primarily from the high cladding temperature P-23 series. The expanded data base includes 305 data sets from 104 fuel pins with peak fuel burnups to 17.2 at.% and peak cladding inner surface temperatures to 730°C. The increase in numbers of data sets as well as the broader range of applicability of the parameters in the revised wastage correlation provides greater assurance that predictions represent expected behavior.

2204 Control Systems

REFER ALSO TO CITATION(S) 15798, 16028

15958 (IAEA-TECDOC—384, pp 99-102) **Control system for the MNSR.** Sun Hong. (Academia Sinica, Beijing, BJ, China. Inst. of Atomic Energy). Aug 1986. NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708. (CONF-8504286—).

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

The MNSR has two modes of control: manual and automatic. The automatic system is based on the computer, PDP-11/34. Because the control system for the MNSR consists of only one control rod, the system for its control is correspondingly simple. Neutron flux levels can be adjusted between 1.0 x 10/sup 8/ to 1.2 x 10/sup 12/ n/s cm/sup 2/. A data logging and annunciation capability is also available 4 figs.

15959 (JINR—13-85-839) **Transfer function of a periodically pulsed reactor.** Popov, A.K. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1985. 9p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700772.

For dynamic analysis a pulsed reactor is considered as a pulsed system with an ideal pulsed element. The reactivity power transfer function is obtained by control theory methods. It connects the curves of discrete functions - reactivity and power pulse energy. Unlike a generally accepted simple meanvalue reactor model, a pulsed reactor model is applicable to low frequency of power pulsed too. The calculated frequency characteristics of the IBR-2 pulsed reactor model are given. 7 refs.; 3 figs.

15960 (JINR—13-85-840) **Stability of a periodically pulsed reactor.** Popov, A.K. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1985. 5p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700773.

To reveal the pulsed reactor stability area the Nyquist criteria for pulsed system is used. It is shown that the reactor is stable if its mean power is less than the boundary value. The boundary value increases with increasing the power pulse frequency and time constant of negative power feedback and with decreasing the transfer coefficient of feedback. Unlike a pulsed reactor model, a meanvalue reactor model giving a wrong results, when determining the stability region. 6 refs.; 1 tab.

15961 (JINR—R-11-85-344) **Program for smooth approximation of a function of two variables.** (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1985. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701338.

DSMAP program (FORTRAN-4, IBM EC computers) used to interpolate and smooth the real function of two variables is described. The DSMAP program is used for solving the problem of power distribution reconstruction in a power reactor core on the base of a fixed number of neutron emission detectors indications. The algorithm used is stable, it provides for necessary accuracy of calculations and obtaining the information on reactor core state in the on-line mode. Numeric experiments modeling functions with artificially introduced random errors show that the given algorithm of smooth approximation of data operates quickly and reduces the level of experimental noise at smoothing in several times. 1 ref.; 1 fig.; 3 tabs.

15962 (KIYI—85-19) **Calculation technique and results of nonstationary fields of energy release in RBMK reactors.** Khalimonchuk, V.A.; Kuchin, A.V.; Krayushkin, A.V.; Lavrenov, Yu.I. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 38p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700830.

The calculation procedure of nonstationary fields of energy release in reactors of RBMK type has been cited in adiabatic approximation taking account of nucleus concentration feedback of isotopes /sup 135/Xe, /sup 149/Sm, fast and delayed power effects of reactivity. The investigations have been carried out on deformations of radial fields of energy release in transients, connected with short stops of reactor. 3 refs.; 6 figs.; 8 tabs.

15963 **Implicit Kalman filter algorithm for nuclear reactor analysis.** Hassberger, J.A.; Lee, J.C. (Univ. of Michigan, Ann Arbor). *Transactions of the American Nuclear Society;* **53**: 249-250(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Artificial intelligence (AI) is currently the hot topic in nuclear power plant diagnostics and control. Recently, researchers have considered the use of simulation as knowledge in which faster than real-time best-estimate simulations based on first principles are tightly coupled with AI systems for analyzing power plant transients on-line. On-line simulations can be improved through a Kalman filter, a mathematical technique for obtaining the optimal estimate of a system state given the information contained in the equations of system dynamics and measurements made on the system. Filtering can be used to systemically adjust parameters of a low-order simulation model to obtain reasonable agreement between the model and actual plant dynamics. The authors present here a general Kalman filtering algorithm that derives its information of system dynamics implicitly and naturally from the discrete time step-series of state estimates available from a simulation program. Previous research has demonstrated that models adjusted on past data can be coupled with an intelligent controller to predict the future time-course of plant transients.

15964 **Backfit of advanced technology to improve plant operability and maneuverability.** Mueller, N.P. (Westinghouse Corp.). *Transactions of the American Nuclear Society;* 53: 400-401(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Expanding nuclear regulatory requirements have had the effect of reducing plant operability. This has had a negative impact on the ability of nuclear units to proactively respond to increased maneuvering requirements that accompany the increasing proportion of nuclear generation in the US. These regulations also place additional burdens on the operator. There are a variety of active programs in place to address the issue of improved operability and maneuverability. This paper discusses some backfit applications of advanced technology in the area of core monitoring and control for pressurized water reactors (PWRs). These have significantly increased the ability of the PWR to respond to grid transients while reducing the duties of the operating staff during such maneuvers.

2205 Environmental Aspects

15965 **(CONF-860911—27) Downstream behavior of fission products.** Johnson, I.; Farahat, M.K.; Settle, J.L.; Johnson, C.E.; Ritzman, R. (Argonne National Lab., IL (USA); Electric Power Research Inst., Palo Alto, CA (USA)). 1986. Contract W-31109-ENG-38. 14p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004667.

From 192. American Chemical Society national meeting; Anaheim, CA, USA (7 Sep 1986).

The downstream behavior of fission products has been investigated by injecting mixtures of CsOH, CsI, and Te into a flowing steam/hydrogen stream and determining the physical and chemical changes that took place as the gaseous mixture flowed down a reaction duct on which a temperature gradient (1000° to 200°C) had been imposed. Deposition on the wall of the duct occurred by vapor condensation in the higher temperature regions and by aerosol deposition in the remainder of the duct. Reactions in the gas stream between CsOH and CsI and between CsOH and Te had an effect on the vapor condensation. The aerosol was characterized by the use of impingement tabs placed in the gas stream.

15966 (INIS-mf—10555, pp 25-32) **Present status of geological and geophysical work at selected nuclear power plant sites in Czechoslovakia.** Cidlinsky, K.; Simunek, P. (Geofyzika, N.P., Brno, Czechoslovakia; Energoprojekt, Prague, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

In the last three years geological methods were used in Czechoslovakia to study several potential and approved sites for the construction of nuclear power plants. In the Blahutovice locality (northern Moravia) large-scale geophysical measurements have been carried out since 1982 whose objective is to identify microbumps and to determine their foci in the surrounds of the future nuclear power plant construction site. Similar measurements are being prepared for other localities, namely in eastern Bohemia and in Kecerovce in eastern Slovakia. In other localities changes in the intensity of earthquakes are studied caused by the detailed geological and hydrogeological situation. (Z.M.).

15967 (INIS-mf—10555, pp 33-41) **Synthetic seismic shifts and prospects of application.** Juhasova, E. (Slovenska Akademia Vied, Bratislava, Czechoslovakia. Ustav Stavebnictva a Architektury). 1985. (In Slovak). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

Synthetizing seismic accelerograms are ever more frequently being used in the design of highly important structures, among them also nuclear power plants. Experience has shown that the overall outlook of synthetizing accelerograms resembles recordings of natural seismicity. This has been proved on the example of the locality of the Mochovce nuclear power plant. The following data were used as input data for the synthetizing accelerogram: rock subgrade, the nearest epicentre of historical earthquakes at a distance of 30 to 50 km from the locality, seismic degree within the range of 6 to 7 degrees of the MCS scale. The spectra of seismic response were calculated for the frequency range 1 to 100 Hz. Data on microbumps of soil and on the effects of blasting on subgrade and structure vibrations were also used to obtain information on the character of the transfer of the seismic effect through the geological medium. (Z.M.).

15968 (INIS-mf—10555, pp 91-95) **Present state and prospects of calculation techniques of seismic engineering at Energoprojekt Praha.** Bartak, V. (Energoprojekt, Prague, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

With regard to the fairly low seismic activity in Czechoslovakia, earthquake parameters cannot be directly used for designing safe structures and technologies. Energoprojekt, being the general project designer of nuclear power plants in Czechoslovakia whose task it also is to select suitable construction sites, has a data bank of accelerograms of earthquakes in the world. Analogous accelerograms designed for the calculations of the dynamic stress of structures must be modified to suit local geological conditions, and the set of accelerograms must be thus completed with synthesized accelerograms which take into account not only geological effects but also the mechanism of the source of the earthquake and provide the possible courses of acceleration caused by distant earthquakes. Briefly described are mathematical methods which Energoprojekt plans to apply for the use of the accelerogram data bank. (Z.M.).

15969 **Radioactive and electron microscope analysis of effluent monitor sample lines.** Kowalski, J.F. (Duquesne Light Co.). *Transactions of the American Nuclear Society;* 53: 427-429(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Effluent air sampling at nuclear power plant often leads to the question "How representative is the sample of the effluent stream?" Samples from radiation monitors are typically obtained at great distances from the sample nozzle because of high background concerns under postulated accidents. Sample line plateout during normal effluent sampling becomes the major concern. A US Nuclear Regulatory Commission inspection raised a concern that monitors were not collecting representative samples per ANSI standard N13.1. A comprehensive 2-yr study at Beaver Valley was performed during normal effluent releases in two phases: 1) weekly charcoal and glass fiber filter samples were analyzed for radioactivity for 6 months, and 2) nuclepore membrane filter samples were analyzed by electron microscope for 4- and 6-h periods. A specially designed test nozzle was directly inserted into an effluent stream for comparison with the radiation monitor samples. Particle behavior characteristics can be determined during effluent releases using a simple test probe. While particle plateout was the major purpose of the study, other particle behavior characteristics were evident and equally as important. Particle travel through long sample lines can also lead to (a) agglomeration or the coagulation of smaller particles to form larger ones, (b) particle splitting or fracturing upon impact with the sample line interior walls, and (c) resuspension of large particles in sample lines.

15970 **Release of tellurium and caesium from UO/sub 2/ in LWR fuel rods during irradiation.** Malen, K. (Studsvik Energiteknik AB, Nykoping). pp 37-62 of Water reactor fuel element performance computer modelling. Gittus, J. New York, NY; Elsevier Science Pub. Co. Inc. (1983).

The release of tellurium (Te-132) and caesium (Cs-134 and Cs-137) from UO/sub 2/ fuel is analyzed. The basis for the analysis is the experimental results from the S176 series of experiments performed at Studsvik. It seems that the model developed earlier for release of iodine applies also to tellurium and caesium. The model assumes sweeping up of the species in question by moving grain

boundaries and subsequent release through grain boundary porosity. An interesting extra feature is deposition of tellurium at temperatures in the range 1500-2000 K believed to be due to condensation.

15971 **Prediction of the UO/sub 2/ fission gas release data of Bellamy and Rich using a model recently developed by Combustion Engineering.** Freeburn, H.R.; Pati, S.R. (Combustion Engineering, Inc., Nuclear Power Systems, Windsor, CT). pp 543-558 of Water reactor fuel element performance computer modelling. Gittus, J. New York, NY; Elsevier Science Pub. Co. Inc. (1983).

The trend in the light water reactor industry to higher discharge burnups of UO/sub 2/ fuel rods has initiated the modification of existing fuel rod models to better account for high burnup effects. The degree to which fission gas release from UO/sub 2/ fuel is enhanced at higher burnup is being addressed in the process. Fission gas release modeling should include the separation of the individual effects of thermal diffusion and any burnup enhancement on the release. Although some modelers have interpreted the Bellamy and Rich data on fission gas release from UO/sub 2/ fuel in this fashion, they have assumed that below about 1250°C the gas release is not temperature-dependent, and this has led them to predict a very strong burnup enhancement of gas release above 20 MWd/kgU. More recent data, however, suggest that an appreciable amount of fission gas is released by a thermal diffusion mechanism at even lower temperatures and will add to the fission gas released due to the temperature-independent mechanisms of knockout and recoil.

15972 **Effect of axial diffusional delays on the overall fission gas release.** Pedersen, N.K. (Exxon Nuclear Co., 2955 George Washington Way, Richland, WA). pp 315-320 of Water reactor fuel element performance computer modelling. Gittus, J. New York, NY; Elsevier Science Pub. Co. Inc. (1983).

In fission gas release modeling, it is normally assumed that any locally released gas mixes instantly and perfectly with other gases throughout the internal rod void volume. The present work investigates the consequences of the assumption that perfect mixing is dependent on diffusion, although the subassumption is maintained that pressure equilibrium is instantly achieved. In other words, when a burst of gas release occurs at any axial location, sufficient local accommodation takes place throughout the rod to eliminate any pressure gradients, but due to the narrowness of the passages through fuel cracks and fuel-cladding gap, concentration gradients may still prevail. Diffusion coefficients for the subsequent concentration equilibration are derived from classical theories. Application of one-dimensional diffusion theory is straightforward, but the lack of knowledge of the effective width of the axial passage introduces an uncertainty.

15973 **(CONF-860906—22) Time constants and feedback transfer functions of EBR-II [Experimental Breeder Reactor] subassembly types.** Grimm, K.N.; Meneghetti, D. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004994.

From Advances in reactor physics and safety meeting; Saratoga Springs, NY, USA (17 Sep 1986).

Time constants, feedback reactivity transfer functions and power coefficients are calculated for stereotypical subassemblies in the EBR-II reactor. These quantities are calculated from nodal reactivities obtained from a reactor kinetic code analysis for a step change in power. Due to the multiplicity of eigenvalues, there are several time constants for each nodal position in a subassembly. Compared with these calculated values are analytically derived values for the initial node of a given channel.

15974 **(CONF-860906—23) Comparisons of PRD [power-reactivity-decrements] components for various EBR-II configurations.** Meneghetti, D.; Kucera, D.A. (Argonne National Lab., IL (USA)). 19 Sep 1986. Contract W-31109-ENG-38. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004712.

From Advances in reactor physics and safety meeting; Saratoga Springs, NY, USA (17 Sep 1986).

Comparison of detailed calculations of contributions by region and component of the power-reactivity-decrements (PRD) for four differing loading configurations of the Experimental Breeder Reactor-II (EBR-II) are given. The linear components and Doppler components are calculated. The non-linear (primarily subassembly bowing) components are deduced by differences relative to measured total PRD values. Variations in linear components range from about 10% to as much as about 100% depending upon the component. The deduced non-linear components differ both in magnitude and sign as functions of reactor power. Effects of differing assumptions of the nature of the fuel-to-clad interactions upon the PRD components are also calculated.

15975 **(CONF-860908—39) An integrated plant-life extension program for EBR-II [Experimental Breeder Reactor].** King, R.W. (Argonne National Lab., Idaho Falls, ID (USA)). 1986. Contract W-31109-ENG-38. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004981.

From Operability of nuclear power systems in normal and adverse environments meeting; Albuquerque, NM, USA (29 Sep 1986).

An integrated plant-life extension program is being developed and implemented at EBR-II. The program plan has five primary areas of focus, and is structured to take advantage of inherent features of the liquid-metal-cooled reactor that give it potential for very long life. The program is centered around development and increased use of computer-based software systems for surveillance, diagnostics, prognostics, data handling, and knowledge transfer. Even though the program is only partially implemented, benefits are already being realized in the form of increased understanding of plant system status and performance due to development of diagnostic data-handling software for manipulation of plant sensor data, and improved force monitoring and protection of the remotely operated fuel handling system. The eventual integration of the elements of the program is a key feature that is expected to enhance the overall effectiveness of the program.

15976 **(CONF-860908—40) EBR-II [Experimental Breeder Reactor-II] system surveillance using pattern recognition software.** Mott, J.E.; Radtke, W.H.; King, R.W. (Saratoga Engineering Consultants, Inc., San Jose, CA (USA); Argonne National Lab., Idaho Falls, ID (USA)). Feb 1986. Contract W-31109-ENG-38. 15p. NTIS, PC A02. File Number DE87004974.

From Operability of nuclear power systems in normal and adverse environments meeting; Albuquerque, NM, USA (29 Sep 1986).

The problem of most accurately determining the Experimental Breeder Reactor-II (EBR-II) reactor outlet temperature from currently available plant signals is investigated. Historically, the reactor outlet pipe was originally instrumented with 8 temperature sensors but, during 22 years of operation, all these instruments have failed except for one remaining thermocouple, and its output had recently become suspect. Using pattern recognition methods to compare values of 129 plant signals for similarities over a 7 month period spanning reconfiguration of the core and recalibration of many plant signals, it was determined that the remaining reactor outlet pipe thermocouple is still useful as an indicator of true mixed mean reactor outlet temperature. Application of this methodology to investigate one specific signal has automatically validated the vast majority of the 129 signals used for pattern recognition and also highlighted a few inconsistent signals for further investigation.

15977 **(CONF-860931—7) Breached pin performance in the EBR-II RBCB program.** Bottcher, J.H.; Lambert, J.D.B.; Lee, M.J.; Strain, R.V.; Ukai, S.; Nomura, S. (Argonne National Lab., IL (USA); Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). 1986. Contract W-31109-ENG-38. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004487.

From International conference on reliable fuels for liquid metal reactors; Tucson, AZ, USA (7 Sep 1986).

The results of five recent RBCB tests show that fuel-sodium reaction does not greatly degrade the performance of $(UPu)O_2$ pins: cladding breaches tend to stabilize and not lose fuel, while reaction product at the surface only mildly increases fuel temperatures. A bundle of 19 high-burnup pins with three failures was operated successfully for 97 days and low-burnup pins with simulated defective upper welds were operated for 152 days without difficulty. Several midlife failures were tested for shorter time to study fuel-sodium reaction. Testing continues in order to characterize the long-term RBCB behavior of midlife failures.

15978 **(CONF-860931—12) Posttest examination results of recent treat tests on metal fuel.** Holland, J.W.; Wright, A.E.; Bauer, T.H.; Goldman, A.J.; Klickman, A.E.; Sevy, R.H. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 14p. NTIS MF A01; 2; GPO Dep. File Number DE87004998.

From International conference on reliable fuels for liquid metal reactors; Tucson, AZ, USA (7 Sep 1986).

A series of in-reactor transient tests is underway to study the characteristics of metal-alloy fuel during transient-overpower-without-scram conditions. The initial tests focused on determining the margin to cladding breach and the axial fuel motions that would mitigate the power excursion. The tests were conducted in flowing-sodium loops with uranium - 5% fissium EBR-II Mark-II driver fuel elements in the TREAT facility. Posttest examination of the tests evaluated fuel elongation in intact pins and postfailure fuel motion. Microscopic examination of the intact pins studied the nature and extent of fuel/cladding interaction, fuel melt fraction and mass distribution, and distribution of porosity. Eutectic penetration and failure of the cladding were also examined in the failed pins.

15979 **(CONF-860931—13) Experience with EBR-II [Experimental Breeder Reactor] driver fuel.** Seidel, B.R.; Porter, D.L.; Walters, L.C.; Hofman, G.L. (Argonne National Lab., Idaho Falls, ID (USA); Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004997.

From International conference on reliable fuels for liquid metal reactors; Tucson, AZ, USA (7 Sep 1986).

The exceptional performance of Experimental Breeder Reactor-II (EBR-II) metallic driver fuel has been demonstrated by the irradiation of a large number of elements under steady-state, transient overpower, and loss-of-flow conditions. High burnup with high reliability has been achieved by a close coupling of element design and materials selection. Quantification of reliability has allowed full utilization of element lifetime. Improved design and duct materials currently under test are expected to increase the burnup from 8 to 14 at.%.

15980 **(CONF-861102—33) Thermal impact of Na_3(U/sub 1-y/Pu/sub y/)O_4 formation on a breached LMR fuel element.** Lee, M.J.; Strain, R.V.; Lambert, J.D.B.; Feldman, E.E.; Shibaraha, I. (Argonne National Lab., IL (USA); Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). 1986. Contract W-31109-ENG-38. 7p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004965.

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Continuous reactor operation with a limited number of breached elements is highly desirable for plant availability and fuel cycle economy. There are, however, concerns about breached element behavior and associated operation consequences, that have not been addressed. These concerns are currently being investigated under the RBCB (Run-Beyond-Cladding-Breach) program in EBR-II, a program jointly sponsored by the US Department of Energy and the Power Reactor and Nuclear Fuel Development Corporation of Japan.

15981 **(CONF-861185—6) Preliminary LEU fuel cycle analyses for the Belgian BR2 reactor.** Deen, J.R.; Snelgrove, J.L. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 15p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004752.

From Reduced Enrichment for Research and Test Reactors (RERTR) program international meeting; Gatlinburg, TN, USA (3 Nov 1986).

Fuel cycle calculations have been performed with reference HEU fuel and LEU fuel using Cd wires or boron as burnable absorbers. The ^{235}U content in the LEU element has increased 20% to 480g compared to the reference HEU element. The number of fuel plates has remained unchanged while the fuel meat thickness has increased to 0.76 mm from 0.51 mm. The LEU meat density is 5.1 Mg U/m^3. The reference fuel cycle was a 31 element core operating at 56 MW with a 19.8 day cycle length and eight fresh elements loaded per cycle. Comparable fuel cycle characteristics can be achieved using the proposed LEU fuel element with either Cd wires or boron burnable absorbers. The neutron flux for E/sub n/ > 1 eV changes very little (<5%) in LEU relative to HEU cores. Thermal flux reductions are 5 to 10% in non-fueled positions, and 20 to 30% in fuel elements.

15982 **(CONF-861185—7) Thermal-hydraulic aspects of flow inversion in a research reactor.** Smith, R.S.; Woodruff, W.L. (Argonne National Lab., IL (USA)). Nov 1986. Contract W-31109-ENG-38. 13p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004751.

From Reduced Enrichment for Research and Test Reactors (RERTR) program international meeting; Gatlinburg, TN, USA (3 Nov 1986).

PARET, a neutronics and thermal-hydraulics computer code, has been modified to account for natural convection in a reactor core. The code was then used to analyze the flow inversion that occurs in a reactor with heat removal by forced convection in the downward direction after a pump failure. Typical results are shown for a number of parameters. Research reactors normally operating much above ten MW are predicted to experience nucleate boiling in the event of a flow inversion. Comparison with experimental results from the Belgian BR2 reactor indicated general agreement although nucleate boiling that was analytically predicted was not noted in the BR2 data.

15983 **(HEDL-SA—3363-FP) The Solid Waste Transfer Pit an FFTF [Fast Flux Test Facility] station for fuel and reflector transfer.** Milewski, A.J.; Thomson, J.D. (Hanford Engineering Development Lab., Richland, WA (USA)). 15 Nov 1985. Contract AC06-76FF02170. 12p. (CONF-860311—11). NTIS, PC A02. File Number DE87004087.

From Nuclear power plant maintenance meeting; Salt Lake City, UT, USA (23 Mar 1986).

This paper describes the design aspects of a proposed FFTF facility called the Solid Waste Transfer Pit (SWTP). This new facility will be used as a transfer station for reflectors and/or low decay heat fuel assemblies when movement from the Fuel Storage Facility for sodium removal and subsequent reprocessing is to be accomplished. The SWTP utilizes a shielded cell cover with an integral manually-operated gate valve for top loading of a transfer vessel. The cost-effective design discussed herein provides a practical approach using state-of-the-art concepts while assuring safe and reliable operation.

15984 **(HEDL-SA—3589-FP) Reactor cover gas monitoring at the Fast Flux Test Facility.** Bechtold, R.A.; Holt, F.E.; Meadows, G.E.; Schenter, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1986. Contract AC06-76FF02170. 15p. (CONF-8609227—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004432.

From IAEA specialists meeting on fast reactor cover gas purification; Richland, WA, USA (24 Sep 1986).

The Fast Flux Test Facility (FFTF) is a 400-megawatt (thermal) sodium-cooled reactor designed for irradiation testing of fuels, materials and components for LMRs. It is operated by the Westing-

house Hanford Company for the US Department of Energy on the government-owned Hanford reservation near Richland, Washington. The first 100-day operating cycle began in April 1982 and the eighth operating cycle was completed in July 1986. Argon is used as the cover gas for all sodium systems at the plant. A program for cover gas monitoring has been in effect since the start of sodium fill in 1978. The argon is supplied to the FFTF by a liquid argon Dewar System and used without further purification.

15985 **(IAEA-TECDOC—384) Technology and use of low power research reactors. Report of a consultants' meeting held in Beijing, China, 30 April-3 May 1985.** (International Atomic Energy Agency, Vienna (Austria)). Aug 1986. 171p. (CONF-8504286—). NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708.

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

The report contains a summary of discussions and 10 papers presented at the Consultants' Meeting on the Technology and Use of Low Power Research Reactors organized by the IAEA and held in Beijing (China) during 30 April-3 May 1985. The following topics have been covered: reactor utilization in medicine and biology, in universities, for training, as a neutron source for radiography and some remarks on the safety of low power research reactors. A separate abstract was prepared for each paper presented at the meeting. Refs, figs and tabs.

15986 (IAEA-TECDOC—384, pp 21-35) **Zero power reactor SUR and its application.** Wesser, U. (Technische Univ. Berlin, Germany, F.R. Inst. fuer Kerntechnik). Aug 1986. NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708. (CONF-8504286—).

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

This low-power reactor, rated nominally at 100 milliwatts, has a cylindrical core of 26 cm in diameter and 24 cm high consisting of U/sub 3/O/sub 8/ powder in a polyethylene matrix. The fuel is 20 percent enriched and the critical mass about 700 g. The excess reactivity is about 3 mk. The reactivity is controlled by two cadmium sheets in addition to a back-up system that drops the inner reflector. The reactor has no active cooling system. Personnel costs include a supervisor and an operator. The reactor is used for training in Reactor Theory (including use of a neutron chopper), reactor kinetics, nuclear technology, reactor operations and for doctoral thesis research. 7 figs.

15987 (IAEA-TECDOC—384, pp 65-88) **Slowpoke-2: Laboratory reactor for neutron irradiation.** Jervis, R.E. (Toronto Univ., Ontario, Canada). Aug 1986. NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708. (CONF-8504286—).

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

The Slowpoke is a small pool-type nuclear reactor designed for use in universities, hospitals and research centers. The reactor has a low critical mass of less than 1kg of HEU fuel. The AECL has recently developed LEU replacement fuel for these reactors. The reactor is controlled by a single Cd control rod which could cause licensing problems in some countries. Maximum excess reactivity is limited to 3.5mk. In regular use, 10,000 to 20,000 capsules can be irradiated per year yielding 250-350,000 data points in derived results. With an annual operating budget of US$80,000, the estimated cost per result obtained is in the order of US$0.20-$0.40, which is much lower than most instrumental trace analysis methods. Examples of recent uses include archeometry, biological sciences, chemistry, earth sciences, environmental science, medicine, metallurgy, and industrial uses. The greatest number of irradiations are performed at 2kW. Forty nine percent of irradiations are for less than 1 minute and 44 percent for 1-10 minutes. The reactor has experienced less than one system malfunction per 3 reactor years. 7 refs, 4 figs, 4 tabs.

15988 (IAEA-TECDOC—384, pp 89-98) **MNSR Reactor.** Zhou Yongmao. (Academia Sinica, Beijing, BJ, China. Inst. of Atomic Energy). Aug 1986. NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708. (CONF-8504286—).

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

This tank-in-pool reactor is based on the same design concept as the Canadian Slowpoke. The core is a right circular cylinder, 24 cm diameter by 25 cm long, containing 411 fuel pin positions. The pins are HEU-Aluminium alloy, 0.5 cm in diameter. Critical mass is about 900 g. The reactor has a single cadmium control rod. The back-up shutdown system is the insertion of a cadmium capsule in a core position. Excess reactivity is limited to 3.5mk. In both the MNSR and Slowpoke, the insertion of the maximum excess reactivity results in a power transient limited by the coolant/moderator temperature to safe values, independent of any operator action. This reactor is used primarily in training and neutron activation analysis. Up to 64 elements have been analyzed in a great variety of different disciplines. 4 figs.

15989 (IAEA-TECDOC—384, pp 103-114) **Application of the Miniature Neutron Source Reactor.** Wang Liyu. (Academia Sinica, Beijing, BJ, China. Inst. of Atomic Energy). Aug 1986. NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708. (CONF-8504286—).

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

The Miniature Neutron Source Reactor, built by the Institute of Atomic Energy, operates at a maximum power of 27 kW and a maximum available flux of 1 x 10/sup 12/ n/cm/sup 2/s/sup -1/. It is used primarily for activation analysis in a large number of fields - medicine, foods, geology, environment, industry, etc. Over 1500 different samples have been analysed. The majority of samples are irradiated between 1 and 10 minutes in a flux of 4 x 10/sup 11/ n/cm/sup 2/s/sup -1/. The gamma spectra are analysed using a locally developed software package called the SPAN on a PDP-11/34 computer. 5 figs, 8 tabs.

15990 (IAEA-TECDOC—384, pp 115-116) **MNSR - A satisfactory tool for training and teaching.** Guo Chengzhan. (Academia Sinica, Beijing, BJ, China. Inst. of Atomic Energy). Aug 1986. NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708. (CONF-8504286—).

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

15991 (IAEA-TECDOC—384, pp 117-126) **Operation and utilization of the Argonaut type low flux reactor.** Meulemeester, F.M. de. (Netherlands Energy Research Foundation, Petten). Aug 1986. NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708. (CONF-8504286—).

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

The Low Flux Reactor (LFR) is in operation since 1960. Until 1983 the maximum power level has been 10 kW. In order to perform irradiations and experiments at higher neutron fluences, the power level was increased to 30 kW in 1983. In connection with the power upgrading several modifications to the reactor installation were necessary. The LFR is utilized for: (a) thermal neutron activation analysis, by means of a fast rabbit system, in combination with semi-automatic spectrometry equipment, (b) fast neutron effect studies on a.o. biological specimens by means of a thermal-to-fast neutron converter system, (c) neutron radiography development studies by means of a neutron radiography collimator and exposure system, suited for the "direct" method (gadolinium foil), (d) training and education purposes. In view of its favourable neutron-gamma ratio future utilization of the LFR for neutron capture-gamma ray spectrometry studies is being considered. 7 refs, 8 figs.

15992 (IAEA-TECDOC—384, pp 127-154) **Some experience with operation and use of a training reactor.** Levai, F.; Csom, G. (Budapesti Mueszaki Egyetem, Hungary). Aug 1986. NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708. (CONF-8504286—).

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

This reactor was originally designed for 10kW and upgraded to 100kW in 1980. It is a pool-type reactor with a primary and secondary cooling circuit utilizing EK-10 cylindrical rod fuel of UO/sub 2/ with enrichment of 20 percent. This design is similar to

other reactors operating up to 2MW. The experimental facilities include five horizontal beam tubes, a large tunnel usable as a thermal column, vertical in-core and reflector irradiation positions and a pneumatic transfer system. The staff for the training center consists of about 50 people responsible for the operation, maintenance, repair and utilization of the reactor. The reactor is used primarily for training university and outside personnel but is also used for research, non-destructive testing, neutron radiography and development of nuclear radiation instrumentation. Its low neutron flux, however, does not permit neutron diffraction or scattering activities. 23 refs, 11 figs.

15993 (IAEA-TECDOC—384, pp 155-170) **Training on Siloette reactor and associated simulators at the Grenoble Nuclear Research Centre.** Destot, M. (CEA Centre d'Etudes Nucleaires de Grenoble, 38, France). Aug 1986. NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708. (CONF-8504286—).

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

The Siloette is a plate-type pool reactor designed to train engineers and technicians for positions in the nuclear power programme. The reactor also serves as a mock-up for experiments to be conducted in the larger Siloe (35MW) and Melusine (8MW) reactors. Its beam tubes are also useful for applications in neutron radiography. The number of trainees attending courses at this reactor has increased from 165 in 1975 to 650 (expected) in 1985. Most courses last from one to three weeks. Training on the Siloette reactor is augmented by a number of nuclear power plant simulators. Compact simulators for both PWRs and GCRs are installed.

15994 (IAEA-TECDOC—384, pp 37-63) **Applications of a low power nuclear reactor.** Blotcky, A.J. (Veterans Administration Medical Center, Omaha, NE, USA). Aug 1986. NTIS (US Sales Only), PC A08/MF A01. File Number DE87700708. (CONF-8504286—).

From Consultants' meeting on the technology and use of low power research reactors; Beijing, China (30 Apr 1985).

The Omaha Nebraska Veterans Administration Medical Center (OVAMC) TRIGA reactor is a research reactor designed and fabricated by General Atomic. The reactor first achieved criticality on June 30, 1959. It is a below grade, open-tank-type, ligh water moderated, cooled, and shielded reactor that currently is authorized to operate in the steady-state mode at thermal power levels up to 18KW with an excess reactivity limitation of 0.79% Delta K/K. 18 refs, 9 figs, 3 tabs.

15995 **(JINR—13-85-795) Investigation of pattern recognition algorithm to classify the IBR-2 reactor noise spectra.** Pepelyshev, Yu.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1985. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700769.

The possibility of application of ISODATA heuristic algorithm of pattern recognition to classify the IBR-2 noise power spectra is considered. The individual procedures of full pattern recognition algorithm, including the method of obtaining spectral evaluations, formalised algorithm of information spectra sign choice, and the possibility of getting the algorithm optimum parameters are examined. Selection of reactor power noises measured at different reactor states was taken as an example. it is shown that parameter optimization carried out at different stages of processing, permits to decrease by more than an order the volume of initial information and to increase the number of simultaneously processed spectra up to 3x10/sup 3/. In the range of the reactor mean power W(0.16 upto 1 MW) and coolant flow rate through the reactor core G(26 upto 80 m/sup 3/ per hour) the type of IBR-2 noise power is determined by W, G values and by the intensity of the moving reflector oscillations. The property of the reactor noises indicated may be applied to the reactor state diagnosis. 3 refs.; 4 figs.; 2 tabs.

15996 **FFTF fuel rotation for extended burnup.** Bennett, C.L. (Westinghouse Hanford Co., Richland, WA). *Transactions of the American Nuclear Society;* **53**: 90-92(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The standard driver fuel assemblies for the Fast Flux Test Facility (FFTF) reactor are hexagonally shaped components, 11.976 cm (4.715 in.) across outside load pad flats and 3.66 m (12 ft) long. The assembly is composed of a bundle of 217 fuel pins, 0.584-cm (0.230-in.) o.d., containing mixed oxide (PuO_2-UO_2) pellets; a surrounding duct and lower and upper end hardware. The hexagonally shaped FFTF driver fuel assembly can be positioned within a given core location in any one of six possible orientations. This paper describes how rotation or reorientation of outer fuel in the core provides additional margin for extended burnup. The implementation of this rotation plan is now well under way at the FFTF. Twenty-two driver fuel assemblies in rows 4, 5, and 6 were rotated during the cycle 7 refueling in August of 1985. The projected average peak pellet burnup reduction for these fuel assemblies was 8% as shown in Table I. FFTF Core Management plans to continue rotation of ~20 fuel assemblies per year - amounting to an annual cost savings of ~$400,000, based on saving the equivalent of one to two assemblies per year.

15997 **Remote weighing of irradiated fuel pins at FFTF.** Anglesey, M.O.; Romrell, D.M. (Westinghouse Hanford, Richland, WA). *Transactions of the American Nuclear Society;* **53**: 491-492(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper describes the testing and operations of a remotely operated fuel pin weighing system developed to identify fuel pins with breached cladding in the interim examination and maintenance (IEM) cell at the Fast Flux Test Facility (FFTF) located near Richland, Washington. The IEM cell is a vertical hot cell located within the FFTF containment building that was designed for disassembly and reassembly of experiments and fuel assemblies.

15998 **Simulation of the Berkeley research reactor using DSNP.** DiPeso, G.J.; Ruby, L. (Univ. of California, Berkeley). *Transactions of the American Nuclear Society;* **53**: 48-49(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Preliminary results have been obtained from a simulation of the TRIGA Mark III Berkeley Research Reactor (BRR) using DSNP. The BRR utilizes fuel that is a mixture of zirconium hydride and uranium hydride, with a hydride-to-metal ratio of 1.65 and a ^{235}U enrichment of 28%. At Berkeley, version 3.4 of DSNP runs on an IBM 3081 Computer. The neutronic modules used to simulate the BRR were CNTRL1, NEUTR4, TPOWR4, CORTR4, and FDBEK4. The hydraulic loop consisted of modules LPLEN4, CORTR4, UPLEN4, PIPEUI, IHMXA1, and PIPEIL. As indicated from their names, several of the modules contained in library 1 were rewritten to incorporate a better model. The problem-description program was written to allow data entry from the console, and thus the FORTRAN program did not have to be recompiled for differing reactivity insertions. The decay heat module, GAMAR1, was not employed, since the ultimate objective of the simulation was to investigate operation of the reactor beyond its licensed limits.

15999 **Revitalization of reactor usage through reactor sharing.** Vernetson, W.G. (Univ. of Florida, Gainesville). *Transactions of the American Nuclear Society;* **53**: 60-62(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of this work was to renew interest in using the University Florida Training Reactor (UFTR) for educational and training purposes outside the Nuclear Engineering Sciences (NES) and Environmental Engineering Sciences (EES) Departments at the University of Florida and for research by others outside the NES Department. The availability of the UFTR made possible through a US Department of Energy (DOE) Reactor Sharing Grant provided the mechanism to pursue generation of renewed interest at all levels both within the University of Florida and from other educational and corporate institutions.

16000 **Gamma analysis of soil at SEFOR, a decommissioned reactor.** West, L.; Talebizadeh, M.A. (Univ. of Arkansas, Fayetteville). *Transactions of the American Nuclear Society;* **53**: 165-166(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This is a work-in-progress report of a project to assay the soil for possible fission product contamination at the SEFOR site. SEFOR, the former Southwest Experimental Fast Oxide Reactor, was a cooperative program among a consortium of utilities, General Electric, the US Atomic Energy Commission, and others. The 20-MV(th) sodium-cooled test reactor operated between 1969 and 1972. After cessation of the experimental program, the facility was decommissioned into a mothball status. This work is a result of an effort to examine the site for possible contamination which might have resulted from either operating or decommissioning activities, such as flushing sodium barrels. Soil has been collected in over 25 locations in and around the SEFOR site. Although samples from the entire site have not been analyzed, the investigated areas are free of contamination.

16001 **Remote tool development at the interim examination and maintenance (IEM) cell.** Kalk, J.J. (Westinghouse Hanford, Richland, WA). *Transactions of the American Nuclear Society;* **53**: 510-511(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the interim examination and maintenance (IEM) cell at the Fast Flux Test Facility, radioactive fuel assemblies from the reactor are disassembled remotely for examination. The cell has an argon atmosphere and all of the equipment in the IEM cell must be either removed or worked on in place remotely for maintenance and repair. Equipment is mounted either on the cell walls or on other equipment with remote fasteners. These fasteners are required to be tightened to torque values ranging from 4 to 102 N m, and will be loosened and torqued several times during the lifetime of the cell. The purpose of this paper is to discuss the development philosophy for tools, specifically those relating to remote fasteners used in IEM cell work. The IEM cell fastener tightening system is now a series of wrenches and attachments instead of the one tool originally proposed. This set of tools allows use of relatively inexpensive commercially available equipment to tighten remote fasteners, while giving the cell operators the flexibility to use the tool they fell is best for the job. If the first choice is not available, use of an optional tool is possible with no loss of torque accuracy.

16002 **Robotic system for remote maintenance of a pulsed nuclear reactor.** Thunborg, S. (Sandia National Labs., Albuquerque, NM). *Transactions of the American Nuclear Society;* **53**: 511-512(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Guidelines recently established for occupational radiation exposure specify that exposure should be as low as reasonably achievable. In conformance with these guidelines, SNL has developed a remote maintenance robot (RMR) system for use in the Sandia Pulse Reactor III (SPR III) facility. The RMR should reduce occupational radiation exposure by a factor of 4 and decrease reactor downtime. Other goals include developing a technology base for a more advanced pulse reactor and for the nuclear fuel cycle programs of the US Department of Energy and US Nuclear Regulatory Commission. The RMR has five major subsystems: (a) a chain-driven cart to bring the system into the reactor room; (b) a Puma 560 robot to perform dextrous operations; (c) a programmable turntable to orient the robot to any of the reactor's four sides; (d) a programmable overhead hoist for lifting components weighing up to 400 lb onto or off of the reactor; and (e) a supervisory control console for the system operator. Figure 1 is a schematic diagram of the turntable, hoist, and robot system in position around the SPR III reactor.

16003 **Evaluation of the thermal safety margin for the KMRR using the hot-spot-factor approach.** Rhee, B.W.; Lim, I.C.; Chung, C.H. *Transactions of the American Nuclear Society;* **53**: 528-530(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the thermal-hydraulic (T/H) design of a reactor, several design bases are usually established at the outset and they serve throughout the design process as a set of fundamental criteria on which the adequacy of the thermal-hydraulic design can be judged. Some examples of these are the maximum fuel temperature design bases (DB), departure from nucleate boiling (DNB) BD, and maximum linear heat generation rate DB for pressurized water reactors. The same line of design approach was adopted to design the Korean Multipurpose Research Reactor to be built in the Korean Advanced Energy Research Institute by the end of 1990. The most stringent design basis for T/H design is found to be the onset of nucleate boiling (ONB) margin which is defined as the difference between the ONB wall temperature and the actual wall temperature at the hottest spot in the core. The main objective of this study is to identify what kinds of uncertainties are to be included in the core thermal-margin calculation, to set up a core thermal-margin calculation procedure into which these uncertainty effects are implemented, and to model and quantify their effects on the safety margin. The hot channel factor method for three-dimensional core thermal analysis proposed by Chelemer was used with COBRA-IV-I as the mathematical tool to evaluate the core thermal margin and its sensitivity on these uncertainties.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

Over the last decade, substantial development and progress has been made in the understanding of the nature of severe accidents and associated fission product release and transport. As part of this continuing effort, the United States Nuclear Regulatory Commission (USNRC) sponsored the development of the Source Term Code Package (STCP), which models core degradation, fission product release from the damaged fuel, and the subsequent migration of the fission products from the primary system to the containment and finally to the environment. The objectives of the QUASAR (Quantification and Uncertainty Analysis of Source Terms for Severe Accidents in Light Water Reactors) program are: (1) to address the uncertainties associated with input parameters and phenomenological models used in the STCP; and (2) to define reasonable and technically defensible parameter ranges and modelling assumptions for the use in the STCP. The uncertainties in the radiological releases to the environment can be defined as the degree of current knowledge associated with the magnitude, the timing, duration, and other pertinent characteristics of the release following a severe nuclear reactor accident. These uncertainties can be quantified by probability density functions (PDF) using the Source Term Code Package as the physical model. An attempt will also be made to address the phenomenological issues not adequately modeled by the STCP, using more advanced, mechanistic models.

16005 **(BNL-NUREG—39156) SSI [soil-structure interactions] and structural benchmarks.** Philippacopoulos, A.J.; Miller, C.A.; Costantino, C.J.; Graves, H. (Brookhaven National Lab., Upton, NY (USA); Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). 1986. Contract AC02-76CH00016. 13p. (CONF-8610135—57). This paper presents the latest results of the ongoing program entitled, "Standard Problems for Structural Computer Codes", currently being worked on at BNL for the USNRC, Office of Nuclear

Regulatory Research. During FY 1986, efforts were focussed on three tasks, namely, (1) an investigation of ground water effects on the response of Category I structures, (2) the Soil-Structure Interaction Workshop and (3) studies on structural benchmarks associated with Category I structures. The objective of the studies on ground water effects is to verify the applicability and the limitations of the SSI methods currently used by the industry in performing seismic evaluations of nuclear plants which are located at sites with high water tables. In a previous study by BNL (NUREG/CR-4588), it has been concluded that the pore water can influence significantly the soil-structure interaction process. This result, however, is based on the assumption of fully saturated soil profiles. Consequently, the work was further extended to include cases associated with variable water table depths. In this paper, results related to "cut-off" depths beyond which the pore water effects can be ignored in seismic calculations, are addressed. Comprehensive numerical data are given for soil configurations typical to those encountered in nuclear plant sites. These data were generated by using a modified version of the SLAM code which is capable of handling problems related to the dynamic response of saturated soils.

16006 **(BNL-NUREG—39157) Synthesizing seismic fragility of components by use of existing data.** Bandyopadhyay, K.K.; Hofmayer, C.H. (Brookhaven National Lab., Upton, NY (USA)). 27 Oct 1986. Contract AC02-76CH00016. 5p. (CONF-8610135—58). NTIS, PC A02/MF A01 - GPO. File Number TI87005245.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

Brookhaven National Laboratory has completed Phase I of the Component Fragility Program and is now performing Phase II. The results of Phase I have been published in NUREG/CR-4659. In both Phases, existing test data for various models are utilized to determine the seismic fragilities of different equipment categories. This represents the first large scale attempt to assemble, compile and interpret the very large heretofore fragmented data base. In Phase I, a methodology has been established to compile the test data for variations of testing methods, vibration inputs, damping values, etc. Test response spectra have been used as a measure of the test vibration inputs. Fragility data have been collected and stored in a computerized data bank at BNL for many electrical and control equipment pieces. The data for Motor Control Centers (MCC) and Switchgears have been analyzed in Phase I for determination of the respective fragility levels. Additional test data are being collected in Phase II for these two equipment pieces, as well as other equipment categories. Statistical analyses are also being performed to estimate a single fragility descriptor for each equipment family.

16007 **(CEA-CONF—8343) Calculation RTGV.** Gonzalez, R. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire). 1985. 27p. (In French). (CONF-8311295—6). NTIS (US Sales Only), PC A03/MF A01. File Number DE87750441.

From RELAP TRAC seminar; Fontenay-aux-Roses, France (15 Nov 1983).

This paper presents the results (curves) obtained from the RELAP4-MOD6 code in the case of failure of a steam generator tube. A sensitivity study of mesh generation on physical phenomena is developed. It points out a bad estimation of the emergency injection time and of the period until the break flow stops.

16008 **(CEA-CONF—8348) PKL.** Probst, P.; Szabo, I. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire). 1985. 66p. (In French). (CONF-8311295—7). NTIS (US Sales Only), PC A04/MF A01. File Number DE87750442.

From RELAP TRAC seminar; Fontenay-aux-Roses, France (15 Nov 1983).

This study concerns the simulation of the behavior of a PWR during a LOCA. One studies more particularly the refilling and reflooding phase (PKLI) and the end of the depressurization phase (PKLII). The aim of this test program is to provide the information needed for the validation/verification of computer codes (RELAP4 MOD6, TRAC PF1) and to test an instrumentation realized for the 2D/3D program. A comparison calculation/experiment is presented. 5 refs.

16009 (CONF-860203—, pp 69-78) **Establishing a comprehensive cost-effective radiological protection program for decommissioning project.** Maan, M.A.; Nair, R.P.; Schafer, S. (Atomic Energy of Canada Ltd., Sheridan Park, Ontario). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

With over 30 years of experience in designing and operating nuclear reactors, AECL has undertaken a new challenge, that of decommissioning a prototype nuclear power plant. The conversion of Gentilly-1 from an operational plant to a waste storage facility involved a transfer of irradiated fuel from wet to dry (canister) storage, and an extensive decontamination effort intended to ensure safe passive storage conditions, requiring only minimal surveillance. The program has been severely constrained by the imposition of a two-year schedule and a ceiling on expenditures for completion of the task. The constraints so defined made the requirement for cost-effectiveness mandatory. Yet, because of the commitment to excellence, the radiological protection program was to run its course without any compromises on safety standards, and with keeping the latest ICRP recommendations, on ALARA risk control, in mind. The logic in establishing the program, radiation protection organization, responsibilities and staffing and the personnel selection, training and qualification program are described. The dose control and ALARA program and the health physics facilities and equipment are discussed. Also covered are the experience with field execution of the program, a description of the development of procedures, quality assurance, and health physics interaction with the project. Finally the organization of the project and the subject of management oversight analytic trees are examined.

16010 (CONF-860203—, pp 253-260) **Post-accident recovery operations at TMI-2.** Merchant, D.J.; Tarpinian, J.E. (GPU Nuclear Corp., Middletown, PA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The accident at Three Mile Island Unit 2 resulted in severe radiological conditions in many areas of the station. Personnel entry into some of these areas was required for plant stabilization and radwaste management although the radiation levels were extraordinarily high. At the time of the accident remotely operated equipment was not immediately available that could perform the required tasks in lieu of manned entries. Because of the plant layout, physical constraints, and required versatility, the type of remote equipment needed would have been extremely sophisticated. In fact, attempts were made to find equipment to do this work but none was found that possessed the required level of sophistication or versatility. Personnel radiation exposures may have been significantly reduced had such devices been available for immediate use and designed to perform the necessary tasks. This paper reviews the immediate post-accident recovery tasks with a perspective on the functional criteria for the development of remotely operated equipment which could be used in similar circumstances in the future. Also, recommendations are made for the possible development of plant installed equipment which could be designed to be compatible with remote equipment operations and thus reduce the degree of sophistication needed.

16011 (CONF-860203—, pp 261-270) **Implication of remote technology for decontamination activities.** Kniazewycz, B.G.; Irving, J.T.; Long, D.C.; Wagoner, H. (KLM Technologies, Inc., Walnut Creek, CA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The use of robotics or remote technologies to remove man from hostile environments has long been a driving objective for technology development within the nuclear power industry. The Niagara Mohawk Power Corporation (NMPC) Nine Mile Point

Nuclear Station is taking an organized approach to integrating remote technology into routine decontamination activities, nonprocessed radioactive waste disposal and special decontamination projects. Preliminary tests of an underwater robotic device for scrubbing and vacuuming was conducted at Nine Mile Point Unit 1 (NMP-1). The results of the test successfully provided proof of concept and identified improvements which would render the device acceptable for nuclear power station applications. Niagara Mohawk Power Corporation is undergoing a major radwaste retrofit project involving almost the entire Radwaste Building at NMP-1. The pre-demolition decontamination scenario was determined to be beneficial at reducing the project radiation exposure. Applications of remote technologies were identified to be cost beneficial for several project tasks including inspections, radiation survey mapping, debris sampling and removal, and video documentation. The purpose of this presentation is to discuss the remote technologies application program at Nine Mile Point and present in detail results of the projects mentioned.

16012 (CONF-860203—, pp 323-330) **Evaluation of use of the NNC Gamma-12 portal monitor for internal dosimetry screening during decommissioning.** Wilheim, G.; Youd, J. (Atomic Energy of Canada Ltd., Sheridan Park, Ontario). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The implementation of the Radiation Management Program, during decommissioning of Gentilly-1 NPP, includes a requirement to control occupational doses to ALARA levels. The target, to approach zero dose equivalent commitment due to internal uptakes, was perceived as realistic, provided the frequency of in-vivo monitoring of all personnel was sufficient to detect any problem early. The usual health physics control measures would require whole body counting which is both time consuming and expensive if carried out too frequently. An alternative solution has been found in using a portal monitor, with enhanced sensitivity, for pre-screening of personnel instead of whole-body counts. The National Nuclear Corporation Monitor, Model Gamma-12 was selected mainly for the sensitivity and flexibility, allowing fast processing of personnel being screened. In selecting this method, certain conditions had to be met; in particular, the composition of site main contaminants had to be reasonably well understood. Fortunately, decommissioning which involves a certain waiting period, allows for the decay of short lived radionuclides, hence leaving principally only a small number of long lived gamma emitters. Testing data is given, permitting the evaluation of the sensitivity of the monitor in internal mode and its potential in detecting doses related to the limits prescribed by regulatory agencies. In a final discussion, the advantages and constraints from using this method are presented. Depending on specific circumstances, the use of portal monitor for pre-screening of personnel was found both cost-effective as well as a reliable means of controlling the doses.

16013 (CONF-860203—, pp 369-378) **Fast sorting measurement technique to determine decontamination priority.** Distenfeld, C.H.; Brosey, B.; Igarashi, H. (GPU Nuclear Corp., Middletown, PA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The method used to select decontamination priorities for the Three Mile Island Unit 2 (TMI-2) reactor building (RB) is systematic, but costs in personnel exposure and time must be borne. One way of minimizing exposure is to define and treat the one or two surface sources that are important contributors to the collective dose of the recovery personnel. Surface characteristics can then be determined and decontamination techniques developed to match the removal requirements. At TMI-2, a fast sorting technique was developed and used to prioritize surfaces for exposure reduction. A second quick sort can then be used to determine the next generation of surface characterization, decontamination method selection, and performance. The quick-sort method that was developed is based on the Eberline HP 220A probes directional survey system. The angular response of the HP 220A probes approaches 2 pi steradians and allows toward-away type measurements. Sources distributed over 4 pi steradians are hard to define with this system. Angular differentiation was improved to about pi/2 steradians by redesigning the probe shield. The change allows unambiguous six-direction measurements, such as up, down, front, rear, right, and left with practically no angular overlap or exclusion. A simple, lightweight stand was used to establish an angular reference for the rectangular packaged probe. The six surface planes of the rectangle work with the angular reference to establish the six viewing angles.

16014 (CONF-860501—17) **Part I. Fuel-motion diagnostics in support of fast-reactor safety experiments. Part II. Fission product detection system in support of fast reactor safety experiments.** Devolpi, A.; Doerner, R.C.; Fink, C.L.; Regis, J.P.; Rhodes, E.A.; Stanford, G.S.; Braid, T.H.; Boyar, R.E. (Argonne National Lab., IL (USA)). May 1986. Contract W-31109-ENG-38. 7p. NTIS, PC A02. File Number DE87001570.

From Conference on the science and technology of fast reactor safety; Channel Islands, UK (12 May 1986).

In all destructive fast-reactor safety experiments at TREAT, fuel motion and cladding failure have been monitored by the fast-neutron/gamma-ray hodoscope, providing experimental results that are directly applicable to design, modeling, and validation in fast-reactor safety. Hodoscope contributions to the safety program can be considered to fall into several groupings: pre-failure fuel motion, cladding failure, post-failure fuel motion, steel blockages, pretest and posttest radiography, axial-power-profile variations, and power-coupling monitoring. High-quality results in fuel motion have been achieved, and motion sequences have been reconstructed in qualitative and quantitative visual forms. A collimated detection system has been used to observe fission products in the upper regions of a test loop in the TREAT reactor. Particular regions of the loop are targeted through any of five channels in a rotatable assembly in a horizontal hole through the biological shield. A well-type neutron detector, optimized for delayed neutrons, and two GeLi gamma ray spectrometers have been used in several experiments. Data are presented showing a time history of the transport of Dn emitters, of gamma spectra identifying volatile fission products deposited as aerosols, and of fission gas isotopes released from the coolant.

16015 (CONF-860906—19) **Safety aspects of LMR [liquid metal-cooled reactor] core design.** Cahalan, J.E. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 15p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004979.

From Advances in reactor physics and safety meeting; Saratoga Springs, NY, USA (17 Sep 1986).

Features contributing to increased safety margins in liquid metal-cooled reactor (LMR) design are identified. The technical basis is presented for the performance of a pool-type reactor system with an advanced metallic alloy fuel in unprotected accidents. Results are presented from analyses of anticipated transients without scram, including loss-of-flow (LOF), transient overpower (TOP), and loss-of-heat-sink (LOHS) accidents.

16016 (CONF-860931—10) **Off-normal performance of EBR-II [Experimental Breeder Reactor] driver fuel.** Seidel, B.R.; Batte, G.L.; Lahm, C.E.; Fryer, R.M.; Koenig, J.F.; Hofman, G.L. (Argonne National Lab., Idaho Falls, ID (USA); Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 21p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004978.

From International conference on reliable fuels for liquid metal reactors; Tucson, AZ, USA (7 Sep 1986).

The off-normal performance of EBR-II Mark-II driver fuel has been more than satisfactory as demonstrated by robust reliability under repeated transient overpower and undercooled loss-of-flow tests, by benign run-beyond-cladding-breach behavior, and by forgiving response to fabrication defects including lack of bond. Test results have verified that the metallic driver fuel is very tolerant of off-normal events. This behavior has allowed EBR-II to operate in a combined steady-state and transient mode to provide test capability without limitation from the metallic driver fuel.

16017 (CONF-861204—5) Flow visualization study of inverted U-bend two-phase flow. Ishii, M.; Kim, S.B.; Lee, R. (Argonne National Lab., IL (USA); Korea Advanced Energy Research Inst., Seoul (Republic of Korea); Nuclear Regulatory Commission, Washington, DC (USA)). Dec 1986. Contract W-31-109-ENG-38. 14p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004706.

From 4. Miami international symposium on multi-phase transport and particulate phenomena; Miami Beach, FL, USA (15 Dec 1986).

A hot-leg U-bend experiment was performed. The experimental condition simulated the two-phase flow in a B and W primary loop during a small break loss of coolant accident or during some other abnormal transients. The loop design was based on the scaling criteria developed previously and the loop was operated either in a natural circulation mode or in a forced circulation mode using nitrogen gas and water. The two-phase flow regimes at the hot-leg were identified on the basis of visual observation. The phase separation at the top of the inverted U-bend was observed at low gas flow rate. The void fractions were measured using differential pressure transducers and compared with the prediction from the drift-flux model. The natural circulation flow interruption occurred in two different modes, namely, quasi-periodic and semi-permanent modes. This phenomenon is mainly dependent on the difference in the hydrostatic head in the riser and downcomer, and the flow regime at hot-leg. Besides this flow interruption phenomenon, dynamic flow instabilities of considerable amplitudes have been observed.

16018 (CONF-8610135—51) Simulation experiments for hot-leg U-bend two-phase flow phenomena. Ishii, M.; Hsu, J.T.; Tucholke, D.; Lambert, G.; Kataoka, I. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 23p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004958.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

In order to study the two-phase natural circulation and flow termination during a small break loss of coolant accident in LWR, simulation experiments have been performed. Based on the two-phase flow scaling criteria developed under this program, an adiabatic hot leg U-bend simulation loop using nitrogen gas and water and a Freon 113 boiling and condensation loop were built. The nitrogen-water system has been used to isolate key hydrodynamic phenomena from heat transfer problems, whereas the Freon loop has been used to study the effect of phase changes and fluid properties. Various tests were carried out to establish the basic mechanism of the flow termination and reestablishment as well as to obtain essential information on scale effects of parameters such as the loop frictional resistance, thermal center, U-bend curvature and inlet geometry. In addition to the above experimental study, a preliminary modeling study has been carried out for two-phase flow in a large vertical pipe at relatively low gas fluxes typical of natural circulation conditions.

16019 (CONF-8610135—54) Validation of seismic soil-structure interaction analysis methods: EPRI [Electric Power Research Institute]/NRC [Nuclear Regulatory Commission] cooperation in Lotung, Taiwan, experiments. Kot, C.A.; Srinivasan, M.G.; Hsieh, B.J.; Tang, Y.K.; Kassawara, R.P. (Argonne National Lab., IL (USA); Electric Power Research Inst., Palo Alto, CA (USA)). 31 Oct 1986. Contract W-31-109-ENG-38. 21p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004937.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

The cooperative program between NRC/ANL and EPRI on the validation of soil-structure interaction analysis methods with actual seismic response data is described. A large scale-model of a containment building has been built by EPRI/Taipower in a highly seismic region of Taiwan. Vibration tests were performed, first on the basemat before the superstructure was built and then on the completed structure. Since its completion, the structure has experienced many earthquakes. The site and structural response to these earthquakes have been recorded with field (surface and downhole) and structural instrumentation. The validation program involves blind predictions of site and structural response during vibration tests and a selected seismic event, and subsequent comparison between the predictions and measurements. The predictive calculations are in progress. The results of the correlation are expected to lead to the evaluation of the methods as to their conservatisms and sensitivities.

16020 (CONF-8610135—56) HDR [Heissdampfreaktor] Phase 2 vibrational experiments. Malcher, L.; Kot, C.A. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004985.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

As part of the second phase of vibrational/earthquake investigations at the HDR (Heissdampfreaktor) Test Facility in Kahl/Main, FRG, high-level shaker tests (SHAG) were performed during June and July 1986. The purpose of these experiments is to investigate full-scale structural response, soil-structure interaction, and piping and equipment response under strong excitation conditions. While global safety considerations imposed load limitations, the HDR soil/structure system was nevertheless tested to its capacity limits. The performance of up to seven different multiple support pipe hanger configurations (ranging from flexible to stiff systems) was evaluated in the tests. Data obtained in the tests serve to validate analysis methods.

16021 (CONF-8611109—3) Influence of azimuthal and axial non-uniformities of fuel clad straining on WWER type assembly flow area blockage under accident conditions. Solyany, V.I.; Andreeva-Andrievskaya, L.N.; Bibilashvili, Yu.K.; Salatov, A.V.; Tonkov, V.Yu. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Neorganicheskikh Materialov, Moscow (USSR)). 1986. 24p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87900498.

From IAEA technical committee meeting on water reactor fuel behaviour and fission products release in off-normal and accident conditions; Vienna, Austria (10 Nov 1986).

The efficiency of provisions against accident situations at WWER NPP due to the depressurization of the primary circuit is in many respects dictated by the conditions of filling in the core from the system of emergency cooling. Therefore, it is important that the fuel clad ballooning in the process of an accident should not significantly block the flow area of fuel assemblies or critically impair their cooling. This paper discusses the influence of fuel clad straining on the blockage in WWER type assemblies and is a further evolution of investigations in this direction.

16022 (CONF-8611109—7) Fuel performance and fission product release during loss of coolant and severe fuel damage accidents. Sills, H.E.; Iglesias, F.C.; Fehrenbach, P.J.; Wood, J.C. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). 1986. 17p. NTIS (US Sales Only), PC A02. File Number DE87900501.

From IAEA technical committee meeting on water reactor fuel behaviour and fission products release in off-normal and accident conditions; Vienna, Austria (10 Nov 1986).

This paper describes the results from out-pile tests to determine the reaction mechanics and kinetics controlling the oxidation of UO_2 at temperatures up to 1600°C. Our studies included the identification of reaction products formed as a function of temperature and oxidizing environment. Factors affecting the oxidative release of fission products from UO_2 and their subsequent transport and deposition were oxide stoichiometry, oxidation rate, grain growth, fragmentation, and the presence of Zircaloy. All-effects, in-pile tests will provide verification of fission product release at sheath temperatures from 1200 to 2500°C. The data we collect will describe the transport and deposition of fission products in the primary heat transport system, fuel element deformation, fuel/clad interaction and post-defect behavior. Additionally, we will accrue data supporting decontamination techniques following a severe fuel damage accident. Results of the LOCA test program are presented as well as the test sequence for the Blowdown Test Facility. The CANSIM suite of fuel performance models has been verified against extensive databases of in-pile results for normal and off-normal behavior respectively. CANSIM integrates fuel codes with

a transient, subchannel code to model the strong interaction between fuel assembly deformation and channel thermalhydraulics and thus simulate fuel element failure, fission product activity release and coolant flow blockage.

16023 **(CONF-8611109—9) PWR [pressurized water reactor] fuel element behavior at temperatures up to 2350°C.** Hagen, S.; Hofmann, P. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Ingenieurtechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). 1986. 47p. NTIS (US Sales Only), PC A03. File Number DE87900493.

From IAEA technical committee meeting on water reactor fuel behaviour and fission products release in off-normal and accident conditions; Vienna, Austria (10 Nov 1986).

Chemical interactions between UO_2 fuel and Zircaloy cladding up to 2350°C are described. UO_2/Zircaloy single effects tests have been performed with short LWR fuel rod segments in inert gas and under oxidizing conditions. The reaction kinetics of molten Zircaloy cladding with solid UO_2 fuel has been investigated with UO_2 crucibles containing molten Zircaloy. The UO_2/Zircaloy reactions obey parabolic rate laws. The oxygen uptake by solid Zircaloy due to chemical interaction with UO_2 occurs nearly as quickly as in reactions with steam or oxygen. To study the competing effects of external and internal cladding oxidation under realistic boundary conditions and the influence of uncontrolled temperature escalation due to the exothermic steam/Zircaloy reaction, single-rod and bundle experiments have been performed. Electrically heated fuel rod simulators, including absorber rod material (Ag, In, Cd alloy), guide tubes and grid spacers are used. The maximum measured cladding temperature during the temperature escalation was about 2200°C. The failure temperature of the absorber rods and the extent of bundle damage depends on the guide tube material (Zircaloy or stainless steel) and varies between 1200 and 1350°C. The molten materials and liquid reaction products can relocate and from large coherent lumps on solidification, which may result in complete blockage of the fuel rod bundle cross section. In the future, 7 x 7 bundle experiments of 2 m overall length will be performed in the new CORA facility to study, in addition, the influence of quenching on fuel rod integrity.

16024 **(EGG-M—25986) TMI-2 lower vessel debris examinations.** Akers, D.W.; Olsen, C.S.; Strain, R.V. (EG and G Idaho, Inc., Idaho Falls (USA); Argonne National Lab., IL (USA)). 17 Nov 1986. Contract AC07-76ID01570. 19p. (CONF-8610135—46). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004535.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

Samples of prior molten debris have been retrieved from the lower reactor head of the TMI-2 reactor. Preliminary results of the examination of these samples are presented with particular emphasis on the metallurgical and radiochemical characteristics of the materials. Areas of nearly pure fuel material in a stoichiometric, $(U,Zr)O_2$ matrix occurred which indicate temperatures approaching the melting point of UO_2 (up to 3100°K). Comparison of the measured radionuclide concentrations in the debris with ORIGEN-2 calculated concentrations indicates significant retention of Cs-137 (up to 22%) in the prior molten debris. Autoradiography results suggest significant accumulations of activity on the surfaces of voids in the debris and at grain boundaries.

16025 **(EGG-M—27686) Preliminary results of the TMI-2 core bores.** McCardell, R.K.; Tolman, E.L.; Martin, M.R.; Smith, R.P. (EG and G Idaho, Inc., Idaho Falls (USA)). 30 Oct 1986. Contract AC07-76ID01570. 21p. (CONF-8610135—47). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004534.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

This paper presents the core bore acquisition data available to date from the Department of Energy TMI-2 Sample Acquisition and Examination Program. Core bore samples have been recently acquired and video inspection of the lower core and core support regions have been completed via the core access holes. The data summarized in the paper include basic observations characterizing the lower region of the core, the core support assembly and lower plenum debris, and details showing how an end-state core configuration was estimated. Implications of the core bore acquisition data on the core damage are discussed in a companion paper also presented in the Conference.

16026 **(EGG-M—32686) Numerical simulation of PWR response to a small break LOCA [loss-of-coolant accident] with reactor coolant pumps operating.** Adams, J.P.; Dobbe, C.A.; Bayless, P.D. (EG and G Idaho, Inc., Idaho Falls (USA); Electric Power Research Inst., Palo Alto, CA (USA)). 1986. Contract AC07-76ID01570. 22p. (CONF-861204—3). NTIS, PC A02 - GPO. File Number DE87004541.

From 4. Miami international symposium on multi-phase transport and particulate phenomena; Miami Beach, FL, USA (15 Dec 1986).

Calculations have been made of the response of pressurized water reactors (PWRs) during a small-break, loss-of-coolant accident with the reactor coolant pumps (RCPs) operating. This study was conducted, as part of a comprehensive project, to assess the relationship between measurable RCP parameters, such as motor power or current, and fluid density, both local (at the RCP inlet) and global (average reactor coolant system). Additionally, the efficacy of using these RCP parameters, together with fluid temperature, to identify an off-nominal transient as either a LOCA, a heatup transient, or a cooldown transient and to follow recovery from the transient was assessed. The RELAP4 and RELAP5 computer codes were used with three independent sets of RCP, two-phase degradation multipliers. These multipliers were based on data obtained in two-phase flow conditions for the Semiscale, LOFT, and Creare/Combustion Engineering (CE)/Electric Power Research Institute (EPRI) pumps, respectively. Two reference PWRs were used in this study: Zion, a four-loop, 1100-MWe, Westinghouse plant operated by Commonwealth Edison Co. in Zion, Illinois and Bellefonte, a two-by-four loop, 1213 MWe, Babcock and Wilcox designed plant being built by the Tennessee Valley Authority in Scottsboro, Alabama. The results from this study showed that RCP operation resulted in an approximately homogeneous reactor coolant system and that this result was independent of reference plant, computer code, or two-phase RCP head degradation multiplier used in the calculation.

16027 **(EGG-M—36186) Relocation of zircaloy-clad uranium dioxide under severe accident conditions.** Cook, B.A. (EG and G Idaho, Inc., Idaho Falls (USA)). 7 Nov 1986. Contract AC07-76ID01570. 18p. (CONF-8611109—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004536.

From IAEA technical committee meeting on water reactor fuel behaviour and fission products release in off-normal and accident conditions; Vienna, Austria (10 Nov 1986).

The mechanisms affecting the relocation of zircaloy-clad UO_2 fuel rods during severe accidents in pressurized water reactors are discussed. Results from two integral in-pile tests and from the damaged Three Mile Island Unit-2 reactor core are presented. The thermal hydraulic conditions that influence fuel relocation are identified and chemical interactions between the fuel and the control rod material are addressed as they relate to material relocation.

16028 **(EPRI-NP—4924-Vol.2) An approach to the verification of a fault-tolerant, computer-based reactor safety system: A case study using automated reasoning: Volume 2, Appendixes: Interim report.** Chisholm, G.H.; Kljaich, J.; Smith, B.T.; Wojcik, A.S. (Argonne National Lab., IL (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. Contract W-31109-ENG-38. 100p. NTIS, PC A05/MF A01 - Research Reports Center, Box 50490, Palo Alto, CA 94303; 1; GPO Dep. File Number DE87005443.

The purpose of this project is to explore the feasibility of automating the verification process for computer systems. The intent is to demonstrate that both the software and hardware that comprise the system meet specified availability and reliability criteria, that is, total design analysis. The approach to automation is based upon the use of Automated Reasoning Software developed at

Argonne National Laboratory. This approach is herein referred to as formal analysis and is based on previous work on the formal verification of digital hardware designs. Formal analysis represents a rigorous evaluation which is appropriate for system acceptance in critical applications, such as a Reactor Safety System (RSS). This report describes a formal analysis technique in the context of a case study, that is, demonstrates the feasibility of applying formal analysis via application. The case study described is based on the Reactor Safety System (RSS) for the Experimental Breeder Reactor-II (EBR-II). This is a system where high reliability and availability are tantamount to safety. The conceptual design for this case study incorporates a Fault-Tolerant Processor (FTP) for the computer environment. An FTP is a computer which has the ability to produce correct results even in the presence of any single fault. This technology was selected as it provides a computer-based equivalent to the traditional analog based RSSs. This provides a more conservative design constraint than that imposed by the IEEE Standard, Criteria For Protection Systems For Nuclear Power Generating Stations (ANSI N42.7-1972).

16029 **(EPRI-NP—4991) Application of the leak-before-break approach to BWR piping: Final report.** Mehta, H.S.; Patel, N.T.; Ranganath, S. (General Electric Co., San Jose, CA (USA). Nuclear Energy Business Operations; Electric Power Research Inst., Palo Alto, CA (USA)). Dec 1986. 115p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920221.

The work reported here consisted of several tasks. The first task dealt with the acceptance criteria for the LBB evaluations and the consideration of limitations in its application. NUREG-1061, Volume 3 recommendations formed the basis of the criteria developed in this task. The second task assigned priorities to BWR piping systems for LBB application based on the factors such as technical viability and cost versus benefits. In the third task, the LBB approach was applied to the recirculation system of a BWR-4 plant. Lastly, stress criteria were developed which a piping analyst could use as guidelines during snubber optimization analyses such that compliance of the piping system with the LBB criteria is reasonably assured.

16030 **(EPRI-NP—4999) Postaccident chemical decontamination: Method development: Final report.** Sjoeblom, R.; Olson, P.M.; Parke, J.M.; Schneidmiller, D. (Pacific Nuclear Services, Richland, WA (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. 168p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920222.

The objectives of this report are to refine the OPG-AP-CITROX process to maximize its effectiveness for decontamination while minimizing its waste disposal costs; to verify the effectiveness of the refined process using TMI-2 artifacts and fuel debris and to assess its corrosion effects on major TMI-2 construction materials.

16031 **(HSK-AN—1816) Chernobyl accident: An overview of causes and effects.** (Bundesamt fuer Energiewirtschaft, Wuerenlingen (Switzerland). Abt. fuer die Sicherheit der Kernanlagen). Oct 1986. 76p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE87700700.

After a brief description of the Chernobyl reactor and the accident, the activity release is assessed. Radiological effects in the immediate vicinity as well as in Europe are discussed, with particular emphasis on Switzerland. Results concerning food contamination are presented. Protective measures are described and an overview of the radiation dose distribution is given. A comparison with the doses from natural radiation and weapons fallout is made.

16032 **(IAE—4118/3) Quenching rates in 7-rod bundle of zirconium alloy at emergency cooling parameters of WWER.** Zemlyanukhin, V.V.; Kabanov, L.P.; Makarovskij, P.L.; Martynova, A.A.; Mordashev, V.M.; Nikonov, S.P.; Rybakov, Yu.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1985. 15p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700705.

On the out-of-pile loop the data on quenching rates in 7-rod bundle of WWER of zirconium alloy in the coolant mass rates range of 10-75 kg/(m/sup 2/xs), initial wall temptratures 600-1100 K, water subcooling at the inlet 5-80 K, specific power release 0-50 kW/m/sup 2/ and pressure 0.1 MPa are obtained. As a result of the analysis of experimental data the dependence for the growth of quenching rates in the rod bundle upon post-accident flooding from the bottom of the reactor core is obtained. The dependence is obtained on the base of method of approximation of many variable functions by superpositions of function sums of less number of variables. Substantial effect of the distance between spacers and their form on the quenching rates is proved. 11 refs.; 10 figs.; 1 tab.

16033 **(IAEA-TC—579-24) Research of LWR [light water reactor] fuel rod behaviour under accident conditions.** Pazdera, F.; Valach, M.; Vrtilkova, V. (Nuclear Research Inst., Rez (Czechoslovakia); Nuclear Fuel Inst., Zbraslav (Czechoslovakia)). 1986. 37p. (CONF-8611109—11). NTIS (US Sales Only), PC A03. File Number DE87900499.

From IAEA technical committee meeting on water reactor fuel behaviour and fission products release in off-normal and accident conditions; Vienna, Austria (10 Nov 1986).

Recent results of theoretical and experimental research on light water reactor fuel rod behaviour under accident conditions are presented. Mechanical equation of state for Zr1Nb cladding alloy is proposed. The equation is compared with 19 tensile tests and 81 creep tests in the strain rate range 10^{-6} - 10^{-1} s^{-1} and temperature range 600 - 900°C. Comparison with experiments confirms both adequate description of steady state and transient loading. Verification of computer code FRAS for light water reactor fuel rod behaviour modelling under accident conditions was performed. Several examples are presented: comparison with published experiments on NSRR reactor; and calculation of WWER 440 fuel rod behaviour under LOCA conditions with and without subchannel thermohydraulics. A two dimensional code describing cladding deformation in r-z geometry was developed. Various deformation shapes are calculated for burst tests performed at constant temperature.

16034 **(IAEA-TC—579-31) Analysis of fission product release during a simulated severe fuel damage accident: The HEVA programme.** Mathiot, A.; Le Marois, G.; Warlop, R. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI); CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Div. de Metallurgie et d'Etude des Combustibles Nucleaires). 1986. 12p. (CONF-8611109—4). NTIS (US Sales Only), PC A02. File Number DE87900500.

From IAEA technical committee meeting on water reactor fuel behaviour and fission products release in off-normal and accident conditions; Vienna, Austria (10 Nov 1986).

The NEVA experiments are part of the CEA.IPSN experimental program devoted to investigating fuel and fission product behavior during severe PWR accidents. The main objectives of the program are as follows: to simulate a defined accident sequence on a section of irradiated pin; to study qualitatively and quantitatively the kinetics of fission product release during the sequence; and to determine the physical and chemical characteristics of the species released. The experimental sequence for the first tests is as follows: temperature increase at a rate of 1°C x m^{-1} up to 1800°C in a mixed atmosphere of steam and hydrogen; stable temperature for 15 minutes; and slow cooling under helium sweeping.

16035 **(IAEA-TC—579/42) Experience in monitoring the BWR [boiling water reactor] fuel behaviour and fission product releases during off normal conditions.** Joshi, N.B.; Srinivasan, V.S.; Nanjundeswaran, K. (Tarapur Atomic Power Station (India)). 1986. 41p. (CONF-8611109—8). NTIS (US Sales Only), PC A03. File Number DE87900503.

From IAEA technical committee meeting on water reactor fuel behaviour and fission products release in off-normal and accident conditions; Vienna, Austria (10 Nov 1986).

Tarapur Atomic Power Station has accumulated over 33 reactor years of operating experience in monitoring Boiling Water Reactor fuel behavior. The sudden and sharp increases in the fission product releases were experienced in the earlier years due to gross fuel failures caused by mechanical damage (lifting of certain core

internals) or due to certain operating practices and transients. Data on fission product releases under such gross fuel failure conditions is presented and discussed with evaluation of the incident and corrective actions taken. An apparent correlation observed in incidents of fuel failures and certain operating system transients are discussed. Conventionally for the BWRs sum of six fission gas release rate measured at Steam Jet Air Ejectors is correlated with fission gas radiation monitor reading to work out alarm and trip settings - modifications are suggested to improve reliability and effectiveness in monitoring of fission gas release rates. Appropriate data for fission product deposition and characterization of coolant crud long lived fission products is also presented.

16036 (INIS-mf—10313) **Probabilistic safety analysis for Sizewell B - Proof of Evidence, established on behalf of the Friends of the Earth, London, within the framework of the Sizewell B Power Station Public Inquiry.** Hahn, L. (Institut fuer Angewandte Oekologie, Darmstadt (Germany, F.R.). Projektgruppe Reaktorsicherheit). Aug 1985. 200p. (In German, English). NTIS (US Sales Only), PC A09/MF A01. File Number DE87750499.

Werkstattreihe. No. 20.

The conclusions drawn in the study presented by the Oeko-Institut, Freiburg, state that there are indeed advantages in the design of the PWR-type Sizewell-B reactor over other types with regard to certain event sequences, but that on the whole, with regard to overall accident probability, there is no significant progress detectable, or even provable. The main results of the analysis in hand undoubtedly are that the unrealistically favourable data presented in the other two Sizewell studies are brought about not by the design features, but by the assumptions, methods and data applied in the studies, so that certain weak points in the methodological approach common to both studies inevitably lead to similar results. The authors of the study in hand explain some of the weak points of the Westinghouse Study and of the CEGB Study to be as follows: Lack of error bands of results. Lack of a quantitative analysis of in-plant fire accidents. Lack of quantitative analysis of external impacts. Lack of (CEGB) or unsatisfactory (Westinghouse) evaluation of the measuring, control, and drive systems. Lack of (CEGB) or unsatisfatory (Westinghouse) evaluation of the human factors. Completely unsatisfactory evaluation of common-mode failures (i.e. multiple failures due to common cause, undiscovered systems interactions, etc.). Unacceptable handling and use of available data (using data assessments made by experts, instead of data available from experience). (orig./HSCH).

16037 (INIS-mf—10524) **APTCARE - Lucas Heights. A plan to cope with accidents at the Research Establishment of the Australian Atomic Energy Commission, Lucas Heights, NSW.** (Australian Atomic Energy Commission Research Establishment, Lucas Heights. Local Liaison Working Party). May 1986. 45p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701295.

Includes a background note by M.H. Brennan, Chairman, AAEC.

This plan details command co-ordination and support responses of Commonwealth and State Authorities in the event of an accident with offsite consequences at the Lucas Heights Research Laboratories. The plan has been prepared by the AAEC Local Liaison Working Party, comprising representatives of the Australian Atomic Energy Commission, NSW Police Department, NSW Board of Fire Commissioners, NSW State Emergency Services and Civil Defence Organisation, NSW Department of Health, NSW Department of Environment and Planning and Sutherland Shire Council.

16038 (INIS-mf—10555) **Safety and operating reliability of the WWER reactor. Seismic load.** Pecinka, L.; Hampala, O. (eds.). (Ceskoslovenska Komise pro Atomovou Energii, Prague). 1985. 236p. (In Czech). (CONF-8410462—). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736.

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

The proceedings contain 21 papers presented at the seminar held in Zelezna Ruda, Czechoslovakia, in October 1984. All papers fall under the INIS scope. (Z.M.).

16039 (INIS-mf—10555, pp 7-24) **Dynamic parameters of seismic waves and the seismic threat to a nuclear power plant site.** Schenk, V.; Schenkova, Z. (Ceskoslovenska Akademie Ved, Prague. Geofyzikalni Ustav). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

The hypothetical maximum effects of the so-called operating basis earthquake and of the safe shutdown earthquake should be defined for expressing the seismic threat to dimensionally and structurally complex structures which include nuclear power plants. Next to the said variables it will be necessary to take into account accelerograms corresponding to the said two types of earthquake. The objective selection of analogous accelerograms for the two types of earthquake necessitates the comprehensive knowledge of seismic wave parameters in the vicinity of the earthquake and their dependence on the earthquake magnitude and the distance from the epicentre. Relations are given of these parameters and macroseismic intensity and briefly described are other parameters obtained by statistical processing of digitalized seismic wave records. (Z.M.).

16040 (INIS-mf—10555, pp 42-57) **Present state of earthquake resistance calculations for the main generating units of nuclear power plants Mochovce and Temelin.** David, M. (Energoprojekt, Prague, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

The finite element method and the ICES program package were used for calculating the earthquake resistance of the main generating unit of the Mochovce nuclear power plant. The seismic calculation of structures includes the calculation of shapes and eigenfrequencies, the calculation of substitute seismic forces, of the dynamic response of structures to accelerogram excitation and the calculation of response spectra from accelerograms. Seismic calculations are being prepared for the Temelin nuclear power plant. The calculation method will be the same with different distribution of facilities and structures into categories of earthquake resistance. So far dynamic calculations have been made of the WWER-1000 reactor containment on a simplified model; the calculation of a spatial model is being prepared which will take account of the fact that the containment is part of a complex structure. (Z.M.).

16041 (INIS-mf—10555, pp 58-69) **Earthquake resistance problems of primary circuit components.** Pecinka, L. (Skoda, Plzen, Czechoslovakia. Zavod Energeticke Strojirenstvi). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

The resistance of primary circuit components to failures caused by a seismic event in the locality of a nuclear power plant is demonstrated by test calculations in two stages: at the project design stage and at the stage of writing the preliminary safety report. In the first stage, attention is devoted mainly to the reactor, the primary circuit pipes, the main closing valves and the pipes of the main circulating pump circuit. Such factors are studied as is the antiseismic positioning of the reactor pressure vessel and the resistance of the reactor internals to plastic deformations. In the second stage, the test calculations are extended to the active and passive safety systems of the primary circuit and to the behviour of the reactor core. The response surface method is recommended for assessing the effect of uncertainty which burdens the calculation of the seismic response of pipings. The method will be used in the preliminary safety report for the Temelin nuclear power plant. (Z.M.).

16042 (INIS-mf—10555, pp 70-90) **Earthquake resistance problems of electric equipment.** Masopust, R. (Skoda, Plzen, Czechoslovakia. Zavod Vystavba Jadernych Elektraren). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

Earthquake resistance of electric equipment of nuclear power plants is assessed by calculation, this in cases where it is possible to easily model the assessed equipment on a mechanical system. If this is not so it will be necessary to make experimental verifications, this either by proof testing for equipment designed for single use or by fragility testing of standard equipment. Briefly discussed are the specificities of evaluating earthquake resistance of electric equipment of nuclear power plants according to regulations valid in western countries and in the USSR. In Czechoslovakia there is no legal standard for such testing and therefore the Soviet experience is of special value, mainly because the reactor type is the same and also with respect to the experimental equipment available. (Z.M.).

16043 (INIS-mf—10555, pp 115-121) **Transverse vibration of beam with beats, induced by seismic excitation.** Peterka, F.; Vacik, J. (Ceskoslovenska Akademie Ved, Prague. Ustav Termomechaniky; Ceskoslovenska Akademie Ved, Prague. Ustav Teorie Informace a Automatizace). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

One of the problems of the earthquake resistance of the primary circuit of nuclear power plants is the transverse vibration of fuel elements with the possibility of the occurrence of beats. In WWER-440 reactors, fuel rod bundles may thus vibrate relative to the hexagonal covering, and entire fuel elements relative to the core basket. A mathematical model of a beam of constant cross-section was therefore constructed substituting for the said parts of the reactor. The continuous beam was substituted with a five-mass mechanical model for the purposes of the calculation. The motion system was modelled on an analog computer. The results show that the maximum transverse displacement of the fuel element is 0.8 mm and that the fuel element will not impact onto the core basket. Inside the fuel element 150 beats will occur during a seismic event lasting 6 seconds, with the centre of the fuel rod bundle having the most frequent impacts. (Z.M.).

16044 (INIS-mf—10555, pp 152-166) **Effect of extreme forces on structures and equipment of nuclear power plants.** Masopust, R. (Skoda, Plzen, Czechoslovakia. Zavod Vystavba Jadernych Elektraren). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

An analysis is made of extreme effects on nuclear power plants, i.e., effects of forces of nature, effects caused by extraneous human activity and effects arising inside the nuclear power plant which may cause accidents threatening nuclear safety. These are unplanned events whose occurrence is expected with a probability of less that 10/sup -1/year and higher than 10/sup -6/ to 10/sup -7/ year. The theory and practice of nuclear power plant project designing devote almost no attention to such events, with the exception of earthquakes. The basic classification is presented of these effects according to valid regulations in the USA, the USSR and the FRG and also under IAEA regulations. A detailed analysis is also made of extreme effects on the structures and equipment of nuclear power plants in Czechoslovak conditions. (Z.M.).

16045 (INIS-mf—10555, pp 173-183) **Dynamic response of nuclear power plant generating unit at simulated seismic excitation.** Rejf, P.; Konstantinidis, S. (Statni Vyzkumny Ustav pro Stavbu Stroju, Bechovice, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

Three synchronized Vibroseis generators placed outside the reactor building were used to simulate seismic effects on the generating unit of the Dykovany nuclear power plant. The excitation force showed a sine waveform with a continuously changing frequency. The vibrations were transmitted to the pressure vessel via the subgrade and the reinforced concrete foundations. The measured data show the relation between the amplitude of induced vibrations of the pressure vessel and the magnitude of simulated seismic activity. This relationship may be used for determining the stress of various nuclear power plant equipment during an earthquake and for determining its earthquake resistance. The experiment also verified the suitability of used instruments, measuring methods and evaluation procedures. The measured values were used for deriving certain constants for mathematical models used in the calculation of structures. (Z.M.).

16046 (INIS-mf—10555, pp 184-193) **Problems of vibration of liquid in axially symmetric tanks.** Pecinka, L. (Skoda, Plzen, Czechoslovakia. Zavod Energeticke Strojirenstvi). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

A brief description is presented of the development of calculation and experimental methods aimed at identifying the behaviour of liquids in axially symmetric tanks. The methods serve the study of the response of such tanks filled with liquid, to the horizontal component of seismic acceleration of subgrade. Special attention is devoted to the application of the finite element method to the problems of flexible tanks. Suitable calculation methods are recommended for various components of WWER-440 and WWER-1000 reactors. (Z.M.).

16047 (INIS-mf—10555, pp 194-210) **Earthquake resistance of liquid-filled thin-walled cylindrical tanks.** Masopust, R.; Strunc, A. (Skoda, Plzen, Czechoslovakia. Zavod Vystavba Jadernych Elektraren). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

Standard universal programs for finite element analysis of structures and systems appear to be the most suitable for the calculation of earthquake resistance of thin-walled cylindrical vessels filled with liquid. The mathematical model is described developed for these purposes by the SKODA enterprise. Actual calculations are made using program JD 75 S on a SM-4/20 minicomputer and comprise calculation of the maximum value of the hydrodynamic pulsed and convective pressure of the liquid in the tank. The JD 75 S program cooperates with the SAP IV program which is used for calculating eigenvibration of the empty tank and the static response to calculated maximum values of hydrodynamic pressures, including the inertial effect of the tank walls. This response is, within accepted assumptions, equivalent to the maximum dynamic response. (Z.M.).

16048 (INIS-mf—10555, pp 211-216) **Finite element calculation of dynamic behaviour of filled tanks.** Strunc, A. (Skoda, Plzen, Czechoslovakia. Zavod Vystavba Jadernych Elektraren). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

The Lagrangian model was chosen by the SKODA enterprise for finite element calculations of the dynamic behaviour of tanks filled with liquid. An ideal non-viscous liquid is assumed and the pressure inside the liquid is described using a scalar potential field. Neither surface tension nor the energy of waves on the free surface of the liquid nor adhesive forces due to contact with the wall are considered. Energy radiation at the boundary of the discretized zone is not taken into account in the construction of the element. (Z.M.).

16049 (INIS-mf—10555, pp 217-226) **Vibration of liquid in partially filled horizontal channel.** Klatil, J.; Drabek, P. (Vysoka Skola Strojni a Elektrotechnicka, Plzen, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

The integral was used for deriving theoretical relations for eigenfrequencies and vibration shapes of the free surface of the

liquid in a partly filled horizontal circular channel. Ideally tough channel walls are assumed, as is a non-viscous and incompressible liquid. Relations are derived for the first eigenfrequency, this for three cases of channel filling: the channel is half filled, almost full and almost empty. (Z.M.).

16050 (INIS-mf—10555, pp 227-234) **Effects of liquid on partially filled tanks - numerical results.** Cechura, M. (Skoda, Plzen, Czechoslovakia. Zavod Energeticke Strojirenstvi). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

The problem is analysed of eigenvalue in calculating the effect of vibration of the liquid on a partially filled tank. Some numerical results of the calculation of vibration shape and force from the motion of the liquid are presented graphically. (Z.M.).

16051 (INIS-mf—10555, pp 96-106) **Mathematical model for calculating seismic response of type V 213-C reactor.** Zeman, V. (Vysoka Skola Strojni a Elektrotechnicka, Plzen, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

Earthquake resistance of the reactor may be assessed on the basis of an analysis of seismic response. The method of spectral response appears to be advantageous. A mathematical model is described of the WWER-440 reactor which expresses separately the horizontal and vertical components of motions. The structure of the mathematical model allows to aproximately model the vibration of components by neglecting deformations of tougher subsystems and to modify the model for structural modifications of the reactor. The SEIZMO program is used for the numerical calculation of the earthquake resistance of the reactor. The program was experimentally used for resolving the seismic response of the upper block of the reactor. (Z.M.).

16052 (INIS-mf—10555, pp 107-114) **Physics modelling of reactor V 213-C seismic response.** Petrovsky, V.; Brynich, J. (Skoda, Plzen, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

A reduced physical model of organic glass to the scale 1:12 was produced for determining the dynamic response of the WWER-440 reactor to seismic excitation. All anti-seismic elements are easily removable and an extensive experimental program is prepared for the determination of dynamic properties and responses of the reactor model as a dynamic system with many degrees of freedom. In the first stage, the model will be subjected to kinematic excitation by pulses of suitable magnitude, shape and duration and the frequency characteristics will be identified. In the second stage, eigenfrequencies in various frequency ranges will be determined. In the third stage, the non-periodical response will be measured at various points of the model to simulated earthquake according to the selected accelerogram. (Z.M.).

16053 (INIS-mf—10555, pp 122-135) **Seismic load calculation for primary circuit of Dukovany Nuclear Power Plant.** Voborsky, J. (Statni Vyzkumny Ustav pro Stavbu Stroju, Bechovice, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

A complex seismic analysis was made of the pipes (500 mm dia.) of the primary circuit and the connected pipes of the low pressure emergency core cooling system (250 mm dia.) for the Dukovany Nuclear Power Plant. The results of the analysis have shown that the pipes of the emergency core cooling system do not meet the specified level of resistance to the effects of a safe shutdown earthquake (degree 5 on the MSK scale) in four elbows. As for the primary circuit pipes, permissible stress is only exceeded in the elbow before the mouth of the cold leg into the reactor. Seismic control measures have to be implemented to achieve the required earthquake resistance level. (Z.M.).

16054 (INIS-mf—10555, pp 136-143) **Protection of WWER type primary loops against extreme effects.** Podrouzek, J.; Rejent, B. (Skoda, Plzen, Czechoslovakia. Zavod Vystavba Jadernych Elektraren; Sigma, Prague, Czechoslovakia. Vyzkumny Ustav Cerpacich Zarizeni, Potrubi a Armatur). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

Dynamic analyses of the WWER-440 primary loops for the Mochovce nuclear power plant showed that the unprotected primary loop is very soft with a first eigenfrequency of 0.38 Hz. Protection with amortisseurs and viscous shock absorbers was compared and the viscous shock absorber in all cases proved to be more suitable. GERB viscous absorbers will be installed at the Mochovce nuclear power plant. First calculations of the dynamic resistance of the WWER-1000 primary loops for the Temelin nuclear power plant to extreme events were also made. It was shown that the unprotected primary loop is rather soft with a first eigenfrequency of 0.9 Hz, or 0.6 Hz at the pressurizer branch. It will therefore be necessary to protect the primary loops with viscous shock absorbers. (Z.M.).

16055 (INIS-mf—10555, pp 144-151) **Control calculations of seismic effects on pipes using integrated program package.** Roucka, M. (Kralovopolska Strojirna, Brno, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

The program for seismic analysis of the piping of a nuclear power plant is based on the finite element method. The calculation takes place in two stages. First the undamped eigenfrequencies and eigenvectors are calculated. The method of spectral response is then used for determining maximum response during individual eigenoscillations. The incorporation is being prepared of seismic analysis into the complex program package for the calculation of piping. Seismic stress will be incorporated into the calculation of fatigue strength. (Z.M.).

16056 (INIS-mf—10555, pp 167-172) **Dynamic measurement on main generating unit of Dukovany Nuclear Power Plant.** Holub, V. (Energoprojekt, Prague, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A11/MF A01. File Number DE87700736. (CONF-8410462—).

From 4. seminar on safety and operating reliability of the WWER reactor; Zelezna Ruda, Czechoslovakia (17 Oct 1984).

A number of computer programs exists for verifying the effects of extreme load on the main buildings of a Nuclear Power Plant, such as have the character of dynamic effect. In view of the many simplifications which are necessary for these complex calculations the validity of calculated values will have to be verified by experiment. Experimental measurements on the building of the main generating unit were made at the Dukovany nuclear power plant. Three mobile Vibroseis seismic vibrators were used for dynamic excitation providing a total excitation force of 450 kN within the frequency range of 10 to 35 Hz. The measured eigenfrequencies of the vibration of reinforced concrete monolithic structures are in good agreement with calculated values. (Z.M.).

16057 **(INIS-XN—44) Nuclear Liability Act as amended (No. 484/72).** (International Atomic Energy Agency, Vienna (Austria)). 8 Jun 1972. 32p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701306.

This Act which entered into force on 16th June 1972 adopted the essential principles laid down in the Paris Convention. These include in particular absolute liability of the operator, its limitation in amount and in time. (NEA).

16058 (INIS-XN—45) Decree bringing into force the Nuclear Liability Act (No. 486/72). (International Atomic Energy Agency, Vienna (Austria)). 16 Jun 1972. 1p. (In Finnish). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701307.

This decree brings into force the Nuclear Liability Act of 1972 as of 16th June 1972 except for the provisions of Sections 30 to 32 which deal with compensation in the framework of the Brussels Supplementary Convention. (NEA).

16059 (INIS-XN—50) Limiting the liability of the nuclear operator. (International Atomic Energy Agency, Vienna (Austria)). Spr 1986. 8p. (In English and French). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701312.

This is a reprint of an article from NEA Newsletter Volume 4, No. 1, OECD-NEA, Paris.

This article discusses the questioning of a fundamental principle of the special nuclear third party liability regime by certain NEA countries: the limitation of the nuclear operator's liability. This regime, set up since the late fifties at European then at worldwide level, had until now been widely adopted in the national legislation of most of the countries with a nuclear power programme. The author analyses the different arguments in favour of restoring unlimited liability for the nuclear operator and attempts to define its implications for the future of the nuclear third party liability regime in NEA countries. (NEA).

16060 (NUREG—1137-Suppl.5) Safety evaluation report related to the operation of Vogtle Electric Generating Plant, Units 1 and 2 (Docket Nos. 50-424 and 50-425). (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). Jan 1987. 119p. NTIS, PC A06/MF A01 - GPO. File Number TI87900484.

In June 1985, the staff of the Nuclear Regulatory Commission issued its Safety Evaluation Report (NUREG-1137) regarding the application of Georgia Power Company, Municipal Electric Authority of Georgia, Oglethorpe Power Corporation, and the City of Dalton, Georgia, for licenses to operate the Vogtle Electric Generating Plant, Units 1 and 2 (Docket Nos. 50-424 and 50-425). Supplement 1 to NUREG-1137 was issued by the staff in October 1985, Supplement 2 was issued in May 1986, Supplement 3 was issued in August 1986, and Supplement 4 was issued in December 1986. The facility is located in Burke County, Georgia, approximately 26 miles south-southeast of Augusta, Georgia, and on the Savannah River. This fifth supplement to NUREG-1137 provides recent information regarding resolution of some of the open and confirmatory items that remained unresolved at the time the Safety Evaluation Report was issued.

16061 (NUREG/CR—4320) The relationships and influences of fuel and coolant system processes during LWR severe accidents. Rivard, J.B. (Sandia National Labs., Albuquerque, NM (USA); Nuclear Regulatory Commission, Washington, DC (USA). Div. of Accident Evaluation). Dec 1986. Contract AC04-76DP00789. 57p. (SAND—85-1449). NTIS, PC A04/MF A01 - GPO. File Number TI87005236.

This report places the processes of fuel and core damage, reactor coolant system (RCS) flow and heat transfer, and pressure vessel breach - and their respective fission product considerations - in the context of typical risk-dominant accident sequences. Thus the enhanced perception of the relationship (and thus importance) of these processes to the potential consequences of a severe-accident is provided. This is accomplished using both generic and plant-specific relational methods. It is found that the vessel and RCS processes pervasively influence consequences. The experiment programs designed to provide the in-vessel and RCS fuel damage data base are examined in light of this conclusion, and some suggestions are offered.

16062 (SAND—86-2909C) An experimental study of isothermal and boiling liquid jets. Marshall, B.W. Jr.; Berman, M. (Sandia National Labs., Albuquerque, NM (USA)). 1986. Contract AC04-76DP00789. 25p. (CONF-8610135—53). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005066.

From 14. water reactor safety information meeting; Gaithersburg, MD, USA (27 Oct 1986).

Recent observations inside the Three Mile Island-Unit 2 reactor core have shown that about 20 tons of core material melted and poured into the lower plenum. The core material is believed to have poured through and around the holes in the structural plates, creating jets of molten corium falling through water. The experimental work described in this paper illustrates the coarse-mixing behavior of molten jets of iron/alumina falling through water. Significant fragmentation of the jet occurs for pour diameters of 4 to 16 cm. The breakup of a boiling-jet appears to depend on the generation of steam and is significantly different from liquid-gas or isothermal liquid-liquid systems.

16063 (TPR-NS—28-No.1) Nuclear Safety: Technical progress review, January-March 1987. Silver, E.G. (ed.). (Oak Ridge National Lab., TN (USA)). Jan 1987. 159p. GPO. File Number TI87000271.

For the Western nuclear community the Chernobyl tragedy is indeed a special issue which presents a whole series of somewhat contradictory aspects, many of them distressing but some of them offering opportunities and new departures. The fact that Chernobyl happened in the USSR lessens its direct impact on our nuclear programs because the reactor design, safety philosophy, and operating practices are so divergent from ours, but this fact broadens immensely the range of reactor parameters and types about which we now have severe accident information. There appears to be very positive international political effects involving greater openness and willingness to share information by the Soviet Union and new international safety initiatives by the International Atomic Energy Agency (IAEA). The adverse health and economic impacts will affect the Russian population for a long time, but the opportunities for studies on effects of low-level radiation are also tremendous.

16064 Effect of pressurizer sizing on the turbine trip transient. Brownson, D.A.; Baratta, A.J.; Robinson, G.E. (Pennsylvania State Univ., Dept. of Nuclear Engineering, Univ. Park, PA 16802). *Nuclear Technology;* **75**: No. 1, 7-14(Oct 1986).

Following the Three Mile Island accident, a number of suggestions were offered for improving the safety of nuclear power plants. Many of these approaches involve increased dependence on complex and sophisticated safety systems and control technologies. An alternative approach to increased safety is explored; this approach involves the maximization of inherent safety features and minimization of safety and control system action. Specifically, the effects of changing pressurizer size and surge line configuration are examined to determine if the operation of the power-operated relief valve (PORV) could be eliminated during a turbine trip transient in a pressurized water reactor. The study is accomplished using the RETRAN-02 thermal-hydraulic analysis code. The results show that the opening of the PORV could be eliminated if the pressurizer size was doubled and the PORV setpoint increased slightly.

16065 Utility perspectives on decommissioning - the accounting involvement. Kovach, W.D. (Houston Lighting and Power Co., TX). *Transactions of the American Nuclear Society;* **53**: 74(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of this paper is to discuss the approach taken by Houston Lighting & Power Company in determining a decommissioning plan and its continuing efforts toward funding of this plan for the South Texas Project. This approach is broadened to an overall utility viewpoint.

16066 Northrop Triga facility decommissioning plan versus actual results. Gardner, F.W. (Chem-Nuclear Systems, Inc.). *Transactions of the American Nuclear Society;* **53**: 129(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper compares the Triga facility decontamination and decommissioning plan to the actual results and discusses key areas where operational activities were impacted upon by the final US Nuclear Regulatory Commission (NRC)-approved decontamination

and decommissioning plan. Total exposures for fuel transfer were a factor of 4 less than planned. The design of the Triga reactor components allowed the majority of the components to be unconditionally released.

16067 **Research reactor and fuel development/production facility decommissioning technology and experience.** Hoovler, G.S.; Myers, P.M.; Caldwell, C.S. (Babcock & Wilcox). *Transactions of the American Nuclear Society;* 53: 129-130(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper discusses the technology and experience gained in a series of reactor and fuels development facility decommissioning programs carried out by Babcock & Wilcox (B & W) at its US Nuclear Regulatory Commission (NRC)-licensed sites in Lynchburg, Virginia. Areas of generic application to future projects are particularly emphasized. The projects included one test and one research reactor, four low-power critical experiment facilities, and two buildings that housed plutonium/uranium fuels development laboratories. These projects were comprehensive; they included developing the decommissioning and quality assurance plans, interfacing with the NRC, performing the actual decontamination/dismantling work, performing predecontamination and final radiological surveys, and volume reducing, packaging, certifying, classifying and shipping the radioactive waste for disposal.

16068 **Benchmark of systematic human action reliability procedure.** Spurgin, A.J.; Hannaman, G.W.; Moieni, P. *Transactions of the American Nuclear Society;* 53: 139(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Probabilistic risk assessment (PRA) methodology has emerged as one of the most promising tools for assessing the impact of human interactions on plant safety and understanding the importance of the man/machine interface. Human interactions were considered to be one of the key elements in the quantification of accident sequences in a PRA. The approach to quantification of human interactions in past PRAs has not been very systematic. The Electric Power Research Institute sponsored the development of SHARP to aid analysts in developing a systematic approach for the evaluation and quantification of human interactions in a PRA. The SHARP process has been extensively peer reviewed and has been adopted by the Institute of Electrical and Electronics Engineers as the basis of a draft guide for the industry. By carrying out a benchmark process, in which SHARP is an essential ingredient, however, it appears possible to assess the strengths and weaknesses of SHARP to aid human reliability analysts in carrying out human reliability analysis as part of a PRA.

16069 **Human approach to process control and the provision of predictive information.** Bernard, J.A. (Massachusetts Institute of Technology, Cambridge). *Transactions of the American Nuclear Society;* 53: 139-140(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This summary presents the results of a study on the human approach to reactor control. It was determined that the essential aspect of the human control process is the creation and maintenance of mental models for use in predicting plant response. Accordingly, the suggestion is made that faster-than-real-time analytical models be developed to assist operators in the verification of their control decisions. The Massachusetts Institute of Technology (MIT) and the Charles Stark Draper Laboratory (CSDL) are engaged in a joint program to develop advanced instrumentation and control systems for both commercial power and spacecraft reactors. As part of this effort, various digital technologies have been demonstrated on the 5-MW(th) MIT research reactor. These include signal validation and instrument fault detection, equipment status verification, closed-loop control using both analytical and rule-based approaches, control law reconfiguration, and paged computer displays. The success of the MIT-CSDL program has shown that these techniques can be used safely in the actual operation of a nuclear reactor.

16070 **Human factors in risk assessments of nuclear power plants.** Ryan, T.G. (Nuclear Regulatory Commission, Washington, DC). *Transactions of the American Nuclear Society;* 53: 143-144(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper discusses the current state of the human factor in assessments of risk at commercial nuclear power plants (NPPs) vis-a-vis the safety goals of the US Nuclear Regulatory Commission (NRC) and introduces an approach for enhancing the risk assessment process to more fully support those safety goals. It is suggested that risk assessments of NPPs, to date, generally have treated human performance in a peripheral manner. This lack of attention to and integration of the human factor may be attributed to an absence of a systems approach, among other things, excluding qualified human factors/human reliability specialists as full participants. The NRC, as part of its efforts to systematize PRA methodology, form both risk assessment and regulatory decision-making perspectives, is seeking enhanced procedures for integrating the human factor more fully into the PRA process. This involves specification of (a) behavioral science expertise required at each step in the process, (b) tasks to be performed by the behavioral scientist(s) to acquire necessary probabilistic and nonprobabilistic information and data on human performance within the context of the larger systems analysis, (c) interfaces between behavioral scientist(s) and other members of the analysis team (e.g., systems and analyst and PRA specialist), and (d) format and content of technical documentation to support both risk assessment and regulatory decision making.

16071 **Application of embedded training in nuclear power plant control rooms.** Ehrhardt, F.J.; Hopkins, C.O.; Jones, B.G. (Univ. of Illinois, Urbana). *Transactions of the American Nuclear Society;* 53: 144(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The objective of this research is to investigate the feasibility of including embedded training in the control rooms of future generation nuclear power plants. In this context, embedded training refers to the inclusion of operation instruction as an integral part of the system control room, in which operation and training occur simultaneously.

16072 **1986 viewpoint of emergency preparedness in the upper midwest.** Parkyn, J.D. (Dairyland Power Cooperative, La Crosse, WI). *Transactions of the American Nuclear Society;* 53: 69(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The recent Soviet emergency preparedness disaster has started a new round of interactions between utilities and civil governments regarding the adequacy of emergency preparedness around nuclear plants. The 1986 annual meeting of the cooperative produced several questions regarding the potentials of the plant and its impact on the public and the cooperative in the event of an off-normal situation. Emergency preparedness requires a real partnership between local civil authorities and the utility in a close spirit of cooperation with local law enforcement, which is frequently charged with the strongest burdens of emergency planning. It is more evident that the virtual veto power of local branches of government over emergency preparedness needs to be more fully recognized by utilities. Early notification and warning systems are coming under a tighter scrutiny as public perception of their fallibility increases. Another continuing problem with emergency preparedness has been the recognition that guarantees of reaching every individual, particularly in more hostile environments, can not be easily made. The lessons learned in nuclear planning indicate that this is an area too often not given a high enough threshold in the total spectrum of nuclear safety and which, from the utility standpoint, needs to be elevated to a higher threshold of importance.

16073 Mobilization of existing robotic and teleoperated mobile vehicles to mitigate the consequences of radiological emergencies; a TMI-2 reality and a Chernobyl scenario. Meieran, H.B. *Transactions of the American Nuclear Society;* 53: 69-70(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The consequences of radiological emergencies associated with recent accidents at nuclear power plants have been well publicized - 7 yr ago on March 28, 1979, at Three Mile Island unit No. 2 (TMI-2) in Middletown, Pennsylvania, and more recently on April 26, 1986, at the Chernobyl nuclear power station unit No. 4 in the Ukraine, USSR. Estimates of released radiation from both of these plants ranged from <20,000 Ci at TMI-2 to 100,000,000 Ci at Chernobyl. Unfortunately, there were few, if any, facilities, infrastructures, and specialized equipment located near the accidents that could assist in remotely mitigating the consequences associated with the accidents. The remote assistance that could have been offered by robotic and teleoperator-controlled mobile vehicles would have minimized the radiation exposures to personnel who would be assisting in restoring the damaged facilities, evacuating the affected personnel, and removing the contaminated material and equipment. There are, however, considerable numbers of existing equipment and off-the-shelf technologies that could be mobilized and employed immediately within days after a Chernobyl-type accident. Examples of missions and tasks that these mobilized remotely controlled mobile vehicles could be assigned to are listed.

16074 Inclusion of the ocean breeze in Oyster Creek emergency off-site dose assessment. Heck, W. (GPU Nuclear, Parsippany, NY). *Transactions of the American Nuclear Society;* 53: 72(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Oyster Creek Nuclear Generating Station (OCNGS) is located 6 mi west of the Atlantic Ocean. From spring through late summer, atmospheric transport in the vicinity of OCNGS is periodically affected by the ocean breeze. The ocean breeze produces large differences in wind direction within the OCNGS emergency planning zone during the morning to evening hours. In addition, trajectory reversals can occur near the ocean breeze front. These two characteristics of the ocean breeze must be taken into account when interpreting results from conventional atmospheric dispersion models. The purpose of the study was to determine the flow characteristics of the ocean breeze and to apply these characteristics to an emergency preparedness implementing procedure (EPIP). The EPIP would be used to determine the radiological plume impact region if an accidental release occurred during an ocean breeze.

16075 Effect of a detailed radial core expansion reactivity feedback model on ATWS calculations using SASSYS/SAS4A. Wigeland, R.A. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* 53: 303-304(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The present emphasis on inherent safety and inherently safe designs for liquid-metal reactors has resulted in a need to represent the various reactivity feedback mechanisms as accurately as possible. In particular, the reactivity feedback from radial core expansion has been found to provide the dominant negative feedback contribution in postulated anticipated transient without scram (ATWS) events. Review of the existing modeling in the SASSYS/SAS4A computer code system revealed that while the modeling may be adequate for the early phases of various unprotected transients, the accuracy would be less than desirable for the extended transients which typically occur for inherently safe designs. The existing model for calculating the reactivity feedback from radial core expansion uses a feedback from radial core expansion uses a feedback coefficient in conjunction with changes in the temperatures of the grid support plate and the above-core load pad. The accuracy of this approach is determined partly by the conditions used in deriving the feedback coefficient, and their relevance to the transient being investigated. Accuracy is also affected by the need to include effects other than those that could be directly related to changes in the grid plate and above-core load pad temperatures, such as subassembly bowing and the potential for clearances to occur between subassemblies in the above-core load pad region. As a result, a detailed model was developed in an attempt to account for these and other effects in a more mechanistic form.

16076 Impacts of reactivity feedback uncertainties on inherent shutdown in innovative designs. Mueller, C.J. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* 53: 305-306(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The concept of inherent shutdown is emphasized in the approach to the design of innovative, small pool-type liquid-metal reactors (LMRs). This paper reports an evaluation of reactivity feedback uncertainties used in the analyses of anticipated transients without scram for innovative LMRs, and the associated impacts on safety margins and inherent shutdown success probabilities on unprotected loss-of-flow (LOF) events. It then assesses the ultimate importance of these uncertainties on LOF and transient overpower events in evolving metal and oxide innovative designs.

16077 Gravity-driven core cooling system for a BWR. Huang, R.L.; Paradiso, F.M.; Sawyer, C.D.; Choe, H. (General Electric, San Jose). *Transactions of the American Nuclear Society;* 53: 308-309(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

An innovative, mid-sized [300- to 600-MW(e)] boiling water reactor (BWR) concept possessing a high degree of inherent safety has been designed by the General Electric Company. Many of the most recent concepts were developed under the sponsorship of the Electric Power Research Institute's Advanced Light Water Reactor program. The design maximizes the use of BWR technology and operating experience. Modest innovations are included to simplify the performance of safety functions using primarily passive systems. These, as well as other system and structural simplifications, together with a reduced power rating, have the potential to reduce total costs and significantly speed construction.

16078 Passive steam-driven injector as ECCS for an inherently safe BWR. Jayanti, S.; Christensen, R.N. (Ohio State Univ., Columbus). *Transactions of the American Nuclear Society;* 53: 310-312(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Nuclear reactor safety is a major public issue which threatens the future of the nuclear energy option in the US and many other foreign countries. Much discussion has occurred recently concerning systems that incorporate more inherent safety and eliminate some of the complex safety systems without having to incur a significant economic penalty. Participating in the debate, the faculty and the students in the Nuclear Engineering Program at the Ohio State University (OSU) have conceptually developed a 340-MW(e) inherently safe reactor (ISR). The design makes extensive use of conventional light water technology, but it also incorporates several innovative inherent safety features. This paper describes the preliminary analysis of the proposed concept and discusses the safety benefits derived from it.

16079 Application of the GEM shutdown device to the FFTF reactor. Waldo, J.B.; Padilla, A. Jr.; Nguyen, D.H.; Claybrook, S.W. (Westinghouse Hanford, Richland, WA). *Transactions of the American Nuclear Society;* 53: 312-313(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A novel device called the gas expansion model (GEM) is being developed at the Hanford Engineering Development Laboratory for testing in the 400-MW(th) fast flux test facility (FFTF) reactor. Incorporation of the GEM into liquid-metal reactor designs is intended to measurably contribute to the achievement of inherent safety, by allowing the reactor to passively shut down even in the extremely remote (hypothetical) event of an unprotected (no scram) loss-of-flow accident. The purpose of this paper is to describe the GEM and present predictive analyses of the effectiveness of the device during unprotected loss-of-flow experiments in the FFTF.

16080 **Smart approach to level-1 probabilistic risk assessment.** Harper, F.T.; Camp, A.L. (Sandia National Labs., Albuquerque, NM). *Transactions of the American Nuclear Society;* **53**: 315-316(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The US Nuclear Regulatory Commission (NRC) is preparing NUREG-1150 to examine the current perception of risk from a selected group of nuclear power plants. NUREG-1150 will provide the base for comparison of NRC research to industry results, and resolution of numerous severe accident issues. In support of NUREG-1150, Sandia National Laboratories (SNL) has directed the production of Level 1 Probabilistic Risk Assessment (PRAs) for the Surry, Sequoyah, Peach Bottom, and Grand Gulf nuclear power plants. Due to severe time and resource constraints, it was necessary to produce an efficient to smart approach to carry out these analyses. The purpose of this paper is to describe and evaluate the methodology selected. The results produced for NUREG-1150 are described in other papers.

16081 **Summary of core damage frequency from internal initiators: Surry.** Bertucio, R.; Quilici, M.; Young, J. *Transactions of the American Nuclear Society;* **53**: 316-318(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper presents the results of the recent Level 1 Probabilistic Risk Assessment (PRA) performed on the Surry Nuclear Power Station Unit 1. The PRA provided information about light-water reactor risk to the US Nuclear Regulatory Commission (NRC) Office of Research, in support of NUREG-1150, which will examine the NRC's current perception of reactor risk. The Surry Nuclear Power Station has two units of 788-MW(e) capacity and is located near Surry, Virginia. The reactors are Westinghouse three-loop pressurized water reactors with large, dry, subatmospheric containments. The Surry plant was previously analyzed by the Reactor Safety Study. The study was performed in accordance with the methodology described in an accompanying paper in this session.

16082 **Summary of core damage frequency from internal initiators: Peach Bottom.** Kolaczkowski, A.M.; Lambright, J.A.; Cathey, N. (SAIC, Albuquerque, NM). *Transactions of the American Nuclear Society;* **53**: 318-320(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Probabilistic risk assessments (PRAs) based on internal initiators are being conducted on a number of reference plants to provide the US Nuclear Regulatory Commission (NRC) with updated information about light-water reactor risk. The results of these analyses will be used by the NRC to prepare NUREG-1150 which will examine the NRC's current perception of risk. Peach Bottom has been chosen as one of the reference plants. The Peach Bottom Atomic Power Station has two boiling water reactor (BWR) units, each with a capacity of 1150 MW(e). The reactors are each housed in a Mark I containment. Peach Bottom Unit 2 analyzed here, was studied before as part of WASH-1400. A number of plant features tend to be important in determining the nature and frequency of the core melt scenarios for Peach Bottom. These features include the recent above-average diesel generator performance history, the single emergency service water system for both units, the numerous emergency core cooling systems, recent procedure modifications and the low volume containment.

16083 **Summary of core damage frequency from internal initiators: Sequoyah.** Bertucio, R.; Leahy, T.; Held, J. *Transactions of the American Nuclear Society;* **53**: 320-322(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper presents the results of the recent Level 1 Probabilistic Risk Assessment (PRA) performed on the Sequoyah Nuclear Power Station Unit 1. The PRA provided information about light water reactor risk to the US Nuclear Regulatory Commission (NRC) Office of Research, in support of NUREG-1150, which will examine the NRC's current perception of reactor risk. The Sequoyah Nuclear Station has two units of 1128 MW(e) capacity and is located near Chattanooga, Tennessee. The reactors are Westinghouse four-loop pressurized water reactors (PWRs) with ice-condenser containments. The Sequoyah plant was previously analyzed by the Reactor Safety Study Methodology Application Program (RSSMAP). The study was performed in accordance with the methodology described in an accompanying paper in this session. The list of initiators which were explicitly quantified included three loss-of-coolant accident (LOCA) sizes, interfacing LOCAs, loss of offsite power, turbine trip with and without main feedwater, loss of a direct current (dc) bus, and loss of the component cooling water system.

16084 **Summary of core damage frequency from internal initiators: Grand Gulf.** Drouin, M.T.; LaChance, J.L.; Shapiro, B.J.; Wheeler, T.A. (SAIC, Albuquerque, NM). *Transactions of the American Nuclear Society;* **53**: 322-323(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Probabilistic risk assessment (PRAs) based on internal initiators are being conducted on a number of reference plants to provide the US Nuclear Regulatory Commission (NRC) with updated information about light-water reactor risk. The results of these analyses will be used by the NRC to prepare NUREG-1150 which will examine the NRC's current perception of risk. Grand Gulf has been chosen as one of the reference plants. The Grand Gulf Nuclear Plant has two boiling water reactor (BWR) units, each with a capacity of 1250 MW(e). Unit 1 has been in commercial operation since July 1985, Unit 2 is still under construction. The reactors are each housed in a Mark III containment. Grand Gulf Unit 1 analyzed here was studied before as part of RSSMAP. A number of plant features tend to be important in determining the nature and frequency of the core melt scenarios for Grand Gulf. These features include the numerous emergency core cooling systems, systems that are designed to pump saturated water, excellent test and maintenance procedures, the effect of containment failure on injection lines, the isolation of critical components by structural barriers (e.g., enclosed rooms, solid floors/ceilings), and the poor station blackout procedures.

16085 **Evolution of PRA methodology and insights since WASH-1400.** Harper, F.T.; Camp, A.L. (Sandia National Labs., Albuquerque, NM). *Transactions of the American Nuclear Society;* **53**: 324-325(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The US Nuclear Regulatory Commission (NRC) is preparing NUREG-1150 to examine the current perception of risk from a selected group of nuclear power plants. In support of NUREG-1150, Sandia National Laboratories (SNL) has directed the production of Level 1 Probabilistic Risk Assessments (PRAs) for the Surry, Sequoyah, Peach Bottom, and Grand Gulf nuclear power plants; additional studies are planned. The first four plants have been studied previously in either WASH-1400 or RSSMAP. The more recent studies suggest significant changes in perception of dominant accident sequences. In this paper the authors examine the changes in their perception of the likelihood of severe core damage accidents, in terms of both changes in PRA methodology and changes to the plants as a result of evolving regulations.

16086 **Dispersed-flow heat transfer during reflood in a pressurized water reactor after a large-break loss-of-coolant accident.** Hassan, Y.A. (Texas A & M, College Station). *Transactions of the American Nuclear Society;* **53**: 326-328(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The postulated loss-of-coolant accident (LOCA) of a pressurized water reactor has been the subject of intensive experimental and analytical studies in light water reactor safety analysis. Many efforts are devoted to the investigation of the thermodynamic behavior of the reactor core and the effectiveness of the emergency-core-cooling system during reflood phase of a LOCA. In the initial period of reflood phase, the flow patterns at the core higher elevation are considered as the dispersed flow regime. The effect of

liquid phase on the heat transfer cannot be neglected in this dispersed flow regime. It has been found experimentally that a steam-water-droplet flow is ultimately responsible for terminating the cladding temperature excursions in a LOCA. Recently, a study of reflood test predictions with RELAP5/MOD2 showed a tendency to predict lower cladding temperatures during the dispersed flow regime. The purpose of this study is to present a new dispersed flow film boiling, implemented in RELAP5/MOD2. In addition, the RELAP underestimated the vapor temperature. Therefore, a revised interfacial heat transfer coefficient between the droplets and steam was incorporated in the code. Comparison of the current predicted cladding/fuel temperature histories with the reflood data showed a fair agreement.

16087 **Comparison of Lehigh 3 x 3 rod bundle post-CHF data with the predictions of RELAP5/MOD2.** Hassan, Y.A.; Morgan, C.D. (Texas A & M, College Station). *Transactions of the American Nuclear Society;* **53**: 328-330(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

To date, there are only very limited data for nonequilibrium convective film boiling in rod bundle geometries. A recent nine (3 x 3)-rod bundle post-critical heat flux (CHF) from the Lehigh University test facility was simulated using RELAP5/MOD2 cycle 36.02, to assess its capabilities in predicting the overall convective mechanisms in post-CHF heat transfer in rod bundle geometries. The code calculations were compared with the experimental data. With the exception of a premature quench, the cladding temperatures were in a reasonable agreement with the data. However, the code predicted low vapor superheats and void fraction oscillations.

16088 **TRAC analysis of upper plenum thermal-hydraulic phenomena in the slab core test facility.** Shire, P.; Boyack, B. (Los Alamos National Lab., NM). *Transactions of the American Nuclear Society;* **53**: 331-332(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Transient Reactor Analysis Code, TRAC-PF1/MOD1, was used to analyze an upper-plenum model of the Slab Core Test Facility (SCTF). The SCTF is a two-dimensional thermal-hydraulic model of a pressurized water reactor used for core-reflood simulations by the Japan Atomic Energy Research Institute. The purpose of this study was to evaluate the effects of code input-model refinements on the comparison between TRAC calculations and test data. Of particular interest were the comparisons of upper-plenum liquid levels and of the distributions of liquid radially across the upper-plenum. The upper-plenum region was selected for study. The test data indicated that the liquid level responded to the onset of emergency core cooling (ECC) by rising in the upper-plenum immediately when injection occurred. However, the early TRAC results indicated no significant liquid level increase until ~300 s after the injection. Test data also indicated a liquid gradient rising toward the hot-leg entrance, but none was observed with TRAC.

16089 **Use of the Chen boiling heat transfer correlation in once-through steam generator analysis.** Morgan, C.D.; Hassan, Y.A. (VMI Research Labs., Lexington, KY). *Transactions of the American Nuclear Society;* **53**: 332-334(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A method of modifying the Chen boiling correlation for applications where the flow is parallel to rod bundles has been presented which is based on analogous improvements in heat transfer to water during nonboiling flow parallel to rod bundles. This technique gives good results for applications to the B & W OTSG and should be more reliable when extrapolating to other geometries than the previous technique of using P-D for the equivalent diameter.

16090 **BWR/6 DBA analysis with limited ECC.** Aksan, S.N.; Analytis, G.T. (Eidgenoessisches Institut fuer Reaktorforshung, Wuerenlingen, Switzerland). *Transactions of the American Nuclear Society;* **53**: 334-335(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

An important problem in the analysis of loss-of-coolant accident (LOCA) is related to the efficiency of the emergency core cooling systems (ECCSs). Evaluation of core coolability becomes particularly important in the case of delayed action of the aforementioned systems and/or if the water injection rate they provide is limited to a fraction of the design capacity. The transient reactor analysis code TRAC-BD1 version 12 was employed to analyze a boiling water reactor/6 (BWR/6) core behavior under LOCA with limited ECCS. The authors shall be presenting the results of a generic BWR/6 recirculation line break for the case that only one low-pressure coolant injection (LPCI) is operational (limited ECCS case), and the authors compare them to the case that all ECCSs are normally operating (base case).

16091 **Analysis of MSIV-ATWS events with the BNL plant analyzer.** Diamond, D.J. (Brookhaven National Lab., Upton, NY). *Transactions of the American Nuclear Society;* **53**: 335-336(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In a boiling water reactor (MWR) when there is closure of the main steam isolation valves (MSIVs) the energy generated in the core will be transferred to the pressure suppression pool (PSP) via steam that flows out the relief valves. The pool has limited heat capacity as a heat sink and, hence, if there is no reactor trip, there is the possibility that the pool temperature may rise beyond acceptable limits. In the past few years there have been several studies of this problem with emphasis on calculating the power level in the core. In the present study the authors consider the power level as well as the resulting PSP temperature and take into account different assumptions regarding plant parameters and operator actions. The Brookhaven National Laboratory (BNL) Plant Analyzer (BPA) with a BWR/4 plant model was used to do the calculations. The BPA is a special-purpose minicomputer in combination with state-of-the-art thermal-hydraulic modeling that can calculate the behavior of a BWR plant at faster-than-real-time speeds.

16092 **TRACB04 study on suppression pool swelling during containment venting.** Cheung, Y.K.; Chu, K.H.; Teng, J.T. (General Electric Co., San Jose, CA). *Transactions of the American Nuclear Society;* **53**: 337-338(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Following postulated loss-of-decay-heat removal accidents in a boiling water reactor (BWR), continued steam generation in the core could lead to containment overpressurization. The Emergency Procedure Guidelines (EPG), developed jointly by the BWR Owners Group and General Electric Company, recommend operator action to vent the primary containment, as the last resort, to avoid adverse consequence to the containment or potentially to the core. The EPGs provide recommendations to be used by individual utilities in development of their plant's unique emergency operating procedures (EOPs). In formulation of the EOPs for containment venting, a number of factors must be assessed to assure that the operator actions are taken at the proper time and that the minimum consequence of venting results. Among these factors, induced pool-swell loads on containment were postulated due to such events as downcomer clearing and bulk nucleation. This paper presents the results of a study, using computer code TRACB04 of pool swelling induced by venting the containment at high pressure. TRACB04, an enhanced version of TRAC, is a best-estimate computer code for the analysis of BWR transients.

16093 **Summary of PWR leak detection studies.** Cho, J.H.; Elia, F.A. Jr. (Stone & Webster Engineering Corp., Boston, MA). *Transactions of the American Nuclear Society;* **53**: 338-340(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Thermal-hydraulic analysis can be used to determine the location and magnitude of leaks inside and location of leaks outside a pressurized water reactor (PWR) containment as required by plant technical specifications. The major advantage of this detection

method is that it minimizes radiation exposure of maintenance personnel because most of the leak detection process is performed from the control room outside containment. Plant-specific analyses are utilized to predict change in parameters such as local dew point temperature, relative humidity, dry bulb temperature, and flow rate to sump for various leak rates and enthalpies. These parameter responses are then programmed into the plant computer and instrumentation is provided for area monitoring. The actual inputs are continuously monitored and compared to the predicted plant responses to identify the leak location and quantify the leak. This study concludes that a system that monitors dew point (or relative humidity) and dry bulb temperature changes together with the flow rate to the sump will provide the capability to both locate and quantify a leak inside a containment, while a system that monitors dew point temperature (or relative humidity) changes will provide the capability to locate a leak outside a containment.

16094 **Sensitivity study for LOFT analyses with COBRA/TRAC to determine the effect of initial fuel storage energy.** Takeuchi, K.; Young, M.Y. (Westinghouse Corp.). *Transactions of the American Nuclear Society;* **53**: 340-342(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Realistic calculations of the peak cladding temperature during a hypothetical loss-of-coolant accident (LOCA) have been found to produce temperatures much lower than the limit required by Appendix K and the value usually calculated with current licensing models. Recently, an assessment was made of COBRA/TRAC code, against several loss-of-fluid test (LOFT) experiments. This assessment indicated generally good agreement with a variety of thermal and hydraulic parameters. It was found that the fuel gas size, which determined the initial fuel stored energy, was an important parameter determining the peak cladding temperature. A sensitivity study was performed to assess the effect of variations in initial fuel temperature on calculated results. The computed peak cladding temperature was then compared with the test data of L2-3 and L2-5 tests.

16095 **Continuous Bayesian updating; Normal and two stage.** Berger, R.E. (Pacific Gas & Electric Co.). *Transactions of the American Nuclear Society;* **53**: 343-344(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Bayes Theorem is a mathematical relationship used frequently in probabilistic risk assessment. Its usual purpose is to update generic failure data with plant-specific data to produce a failure rate estimate which best expresses the authors state of knowledge. The theorem equation becomes very difficult to solve in practice, so a discrete approximation is used. However, this approximation itself becomes very complicated and time consuming to apply, especially when two-stage Bayesian analyses are performed. In fact, two-stage Bayesian analysis is commonly done with a mainframe computer code. This paper makes use of an important feature of Bayes Theorem to greatly simplify the solution process. The final result is a set of calculations which are simple enough to be done on a hand calculator or personal computer.

16096 **LOCA uncertainty analysis using the Fourier Amplitude Sensitivity Test and the Stepwise Regression Technique.** Kim, T.W.; Lee, B.H.; Chang, S.H. *Transactions of the American Nuclear Society;* **53**: 344-346(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

An uncertainty analysis method is proposed here, which uses Fourier Amplitude Sensitivity Test (FAST) and Stepwise Regression Technique (SRT). This method is a compromise between the approximation method [response surface method (RSM) or moments method] and Monte Carlo method (MCM). It is concluded that: 1. FAST gives the partial variance for each input parameter, which can be used as global sensitivity ranking between input parameters, with moderate sampling point compared to crude MCM. 2. SRT is a good tool to construct the later-used first- or second-order response surface model consisting of comparatively important parameters. 3. The combined uncertainty analysis method using FAST and SRT can be used for uncertainty/sensitivity analysis of the large computer codes with moderate cost and it will be a useful tool to analyze the feasibility of the newly developed, highly uncertain system models.

16097 **Four-train support always more reliable than a two-train support?.** Guey, C.N.; Arrieta, L.; Youngblood, R. (Brookhaven National Lab., Upton, NY). *Transactions of the American Nuclear Society;* **53**: 347-348(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Once the gross features of a frontline fluid system have been defined, one must consider what support system configuration will provide the best overall system performance. This paper considers different direct-current (dc) bus configurations for a given emergency feedwater system (EFWS). Results indicate that a four-train support system (i.e., 4 dc buses) gives a lower system unavailability for transients, but a higher system unavailability for anticipated transients without scram (ATWSs), than a two-train support system (i.e., two dc buses). This serves to illustrate that more trains do not necessarily provide higher reliability, and that a configuration choice which is better for one emission success criterion may be worse for another. Because of the small characteristic unreliability of dc buses, the numerical comparisons made here are not dramatic, but the underlying topological point is nevertheless broadly applicable.

16098 **New scenario for intersystem LOCAs in BWRs.** Chu, T.L.; Stoyanov, S. (Brookhaven National Lab., Upton, NY). *Transactions of the American Nuclear Society;* **53**: 348-349(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of the work is to analyze the scenario of intersystem loss-of-coolant accidents (LOCAs) in the feedwater lines of boiling water reactors (MBWRs), in light of the water hammer event at San Onofre, Unit 1. Such scenario has a potential for high frequency and high consequence. The frequency is potentially high because a similar event has occurred; the consequence is high because containment is bypassed. To summarize, the frequency of intersystem LOCA in the feedwater line of a BWR is estimated to be $\sim 10^{-3}$/yr. If all of the ECCS systems are disabled by environment caused by the blowdown, the frequency of core damage in such a LOCA will be as high as the frequency of the LOCA itself. Plant-specific analysis is needed to assess the effect of blowdown on ECCS.

16099 **Probabilistic analysis of allowed outage times relaxation at a PWR plant.** Cho, N.; Chu, T.; Xue, D.; Bozoki, G.; Youngblood, R. (Brookhaven National Lab., Upton, NY). *Transactions of the American Nuclear Society;* **53**: 349-351(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Technical specifications (TS) in a nuclear power plant are specific requirements on its day-to-day operation, designed to protect public health and safety. Two primary aspects of the TS are (a) limiting conditions of operation with allowed outage times (AOTs) and (b) surveillance testing intervals. In recent years, there has been growing interest in the nuclear community in reexamining the TS. One of the reasons is that a significant portion of reactor downtime (plant unavailability) is attributable to the strict TS. Existing TS were derived from engineering judgment based on deterministic review; they were not directly risk-based, and their efficacy in enhancing public safety is difficult to establish. This paper presents a summary of a critical review of the Westinghouse report, which proposed that AOTs for a number of safety systems at the Byron Generating Station be increased from 3 to 7 days.

16100 **Analysis of reactor trips involving balance-of-plant failures.** Seth, S.; Skinner, L.; Ettlinger, L.; Lay, R. (Mitre Corp.). *Transactions of the American Nuclear Society;* **53**: 351-353(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The relatively high frequency of plant transients leading to reactor trips at nuclear power plants in the US is of economic and safety concern to the industry. A majority of such transients is due to failures in the balance-of-plant (BOP) systems. As a part of a study conducted for the US Nuclear Regulatory Commission, Mitre has carried out a further analysis of the BOP failures associated with reactor trips. The major objectives of the analysis were to examine plant-to-plant variations in BOP-related trips, to understand the causes of failures, and to determine the extent of any associated safety system challenges. The analysis was based on the Licensee Event Reports submitted on all commercial light water reactors during the 2-yr period, 1984-1985.

16101 **Stimulator-based model for estimating operator diagnosis failure probabilities.** Whitehead, D.W.; Weston, L.M.; Graves, N.L. (Sandia National Labs., Albuquerque, NM). *Transactions of the American Nuclear Society;* **53**: 353(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper presents a new method for analyzing operators recovery actions following hypothesized accidents at a nuclear power plant. The actions analyzed were identified as part of the ongoing LaSalle Probabilistic Risk assessment, a part of the US Nuclear Regulatory Commission-sponsored Risk Methods Integration and Evaluation Program (RMIEP). In the authors model, the recovery actions have been broken down into two distinct phases: the diagnosis phase and the action phase. This paper pertains to the diagnosis phase and the analysis uses simulator data to estimate the probability of failure-to-diagnose as a function of time.

16102 **QUASAR: a methodology for quantification of uncertainties in severe-accident source terms.** Khatib-Rahbar, M.; Park, C.; Pratt, W.T.; Bari, R.A.; Ryder, C.; Marino, G. (Brookhaven National Lab., Upton, NY). *Transactions of the American Nuclear Society;* **53**: 354-355(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The radiological consequences of severe nuclear reactor accidents are governed, in large part, by the magnitude and characteristics of the radioactivity release, or radiological source term, from the plant. Over the last decade, substantial development and progress have been made in the state of knowledge concerning the nature of severe accidents and associated fission product release and transport. As part of this continuing effort, the US Nuclear Regulatory Commission has sponsored the development of the source term code package (STCP), which models core degradation, fission product release from the damage fuel, and the subsequent migration of the fission products from the primary system to the containment and finally the environment. The purpose of the present paper is to describe a methodology that was developed as part of the Quantification and Uncertainty Analysis of Source Terms for Severe Accidents in Light Water Reactors (QUASAR) program at Brookhaven National Laboratory. QUASAR is a large program that will apply the methodology described in this paper to severe accident sequences in light water reactors using the STCP.

16103 **Effect of hygroscopicity on aerosol behavior.** Baron, J.; Drozd, A. (Stone & Webster Engineering Corp., Boston, MA). *Transactions of the American Nuclear Society;* **53**: 355-356(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This study examined the hygroscopic effect on aerosol behavior by modifying the condensation model employed in the NAUA-4 computer program to include the hygroscopic properties of CsOH. Correlations were developed for water vapor pressures over CsOH solutions, solution surface tension, and solution thermal conductivity in order to determine the condensation rate on particles. Expressions for the solution density and for the liquidus curve were also developed to calculate solution volume and to partition CsOH between dissolved and nondissolved states.

16104 **Experimental determination of the partition coefficient of HOI.** Harrell, J.R.; Lutz, J.B.; Kelly, J.L. (Univ. of Virginia, Charlottesville). *Transactions of the American Nuclear Society;* **53**: 356-357(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

An understanding of iodine-water chemistry and the partitioning of iodine species between the liquid and vapor phases is necessary for the purpose of iodine source term evaluations. Hypoiodous acid (HOI) is a volatile iodine species formed by the hydrolysis of iodine. In a well-mixed system, equilibrium between the vapor and liquid phases is quickly attained and is quantified in terms of the partition coefficient (PC). At the ANS Topical Meeting on Fission Product Behavior and Source Term Research at Snowbird, Utah, other investigators reported values for the HOI PC in excess of 10^4. Work at the University of Virginia, however, indicates that a more realistic value is closer to 10^3. This paper summarizes that work.

16105 **Effects of organic impurities on the partitioning of iodine.** Lutz, J.B.; Kelly, J.L. (Univ. of Virginia, Charlottesville). *Transactions of the American Nuclear Society;* **53**: 357-358(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

For the purpose of iodine source term calculations, a knowledge of the time dependence of iodine partitioning and the composition of the volatile iodine species may be very important. This study demonstrates the disposition of iodine in a water-air system subjected to gamma radiation can be significantly affected by the presence of organics in the liquid and/or vapor phases. The presence of methanol in a gamma-irradiated water-air-iodine system tends to increase the total iodine partition coefficient over that which would be observed in the absence of methanol. In contrast to methanol, the presence of methane tends to lower the IPC of an irradiated water-air-iodine system, because gaseous molecular iodine (I_2)and methane react to form highly volatile organic iodides.

16106 **TREAT source-term experiment STEP-1 simulating a PWR LOCA.** Simms, R.; Baker, L. Jr.; Blomquist, C.A.; Ritzman, R.L. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* **53**: 358-359(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In a hypothetical pressurized water reactor (PWR) large-break loss-of-coolant accident (LOCA) in which the emergency core cooling system fails, fission product decay heating causes water boil-off and reduced heat removal. Zircaloy cladding is oxidized by the steam. The noble gases and volatile fission products such as cesium and iodine that constitute a principal part of the source term will be released from the damaged fuel at or shortly after the time of cladding failure. TREAT test STEP-1 simulated the LOCA environment when the volatile fission products would be released using four fuel elements from the Belgonucleaire BR3 reactor. The principal objective was to collect a portion of the releases carried by the flow stream in a region as close as possible to the test zone. In this paper, the test is described and the results of an analysis of the thermal and steam/hydrogen environment are compared with the test measurements in order to provide a characterization for analysis of fission product releases and aerosol formation. The results of extensive sample examinations are reported separately.

16107 **Effects of water in film boiling over liquid-metal melts.** Greene, G.; Finfrock, C.; Burson, S.B. (Brookhaven National Lab., Upton, NY). *Transactions of the American Nuclear Society;* **53**: 360-362(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Speculation concerning the effects of an overlying pool of boiling water on a molten LWR core/concrete interaction varying widely and range from no effect other than a source of steam to complete quenching of the debris. In the effort to quantify the effects, the experimental investigation to be described was initiated. Liquid-liquid boiling experiments have been performed with H_2O

and liquid-metal melts in the 100-series test matrix (runs 121, 126, 127) and the VE test matrix. Some of the pre-explosion unstable film boiling data as well as observations from the explosive series have been previously reported. It was observed that water boiling on liquid-metal melts was unstable with respect to disturbances, and that liquid-liquid contacts were occurring at the boiling interface well into the film boiling superheat regime. The presence of these liquid-liquid contacts in film boiling was substantiated by photographic observations in transparent test sections. Narrow liquid-metal jets were observed to spike upward into the boiling water pool above, smearing out the interface between the two fluids into a mixing zone of water and liquid metal. The thickness of this mixing zone appeared from visual observations to be in the range of 1 to 2 cm. It is not presently clear what physical phenomena were responsible for this behavior; however, liquid-solid contacts as well as liquid-liquid contacts in the film boiling regime will be investigated in a future test series.

16108 **MHTGR confinement radiation releases.** Maneke, J.L.; Lanning, D.D.; Lidsky, L.M.; Oddo, J.M.; Baron, J.S.; Drozd, A. (Massachusetts Institute of Technology, Cambridge). *Transactions of the American Nuclear Society;* **53**: 362-364(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Investigations of the chemical form and transport of two fission products released during selected modular high-temperature gas-cooled reactor (MHTGR) postulated accidents have resulted in the conclusion that estimated doses are reduced by as much as 30% when aerosol deposition and chemical species effects are included. Applying chemical equilibrium principles and collision theory, aerosol removal rates were calculated with MHTGR-NAUA, a modified version of the NAUA Mod-4 light water reactor aerosol analysis computer program. The effect of input assumptions on fission product release and off-site dose was then evaluated with the SCIMCA computer program. Preliminary estimates of radiation releases from an MHTGR during credible accidents are well below existing limits. These low estimated releases provide both a safety and an economic incentive for MHTGR development. For example, it is calculated that a non-pressure-retaining building, such as the confinement design shown could adequately protect the public from radiological releases.

16109 **Reinspection methods implemented for quality.** Christensen, J.D.; Heller, A.S. *Transactions of the American Nuclear Society;* **53**: 387-388(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The classification of important to safety has been in the forefront of nuclear power plant operations in recent years. While management does faithfully adhere to the quality assurance program requirements of 10CFR50, Appendix B, the scope of program applicability often does not cover all aspects of operations that indirectly affect safety. A key factor that is considered important to safety, yet has few regulations guiding it, is the quality of performance. The degree of quality to which a person performs a task is subjective in nature. When compared to another person's performance, a measure of quantification is introduced, yet this comparison is a function of many factors, not the least of which is the objectivity of the person who judges or makes the comparisons between the performers. In this paper a program has been described that places the evaluation of job performance on a more quantitative basis. Similar programs have been implemented with success.

16110 **Method to integrate PRA results with plant upgrades.** Weaver, W.W. *Transactions of the American Nuclear Society;* **53**: 390-391(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A question frequently posed by plant personnel is how to make the best use of a completed probabilistic risk assessment (PRA). A proposed methodology is presented here. Its utility is illustrated by performing an analysis with the preliminary results of the TMI-1 PRA. An initial step in formulating a theoretic decision is determination of the appropriate criteria upon which the decision is to be based. A straightforward approach makes use of two basic criteria: risk reduction in terms of core melt frequency (i.e., the US Nuclear Regulatory Commission has expressed a value of 1×10^{-4}/reactor-yr as the goal) and present value (PV) dollars. The methodology presented is similar to a quantified cost/benefit study. It can be used in conjunction with results from any completed PRA or system reliability analyses.

16111 **Quantile arithmetic methodology for uncertainty propagation in fault trees.** Abdelhai, M.; Ragheb, M. (Univ. of Illinois, Urbana). *Transactions of the American Nuclear Society;* **53**: 391-393(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A methodology based on quantile arithmetic, the probabilistic analog to interval analysis, is proposed for the computation of uncertainties propagation in fault tree analysis. The basic events' continuous probability density functions (pdf's) are represented by equivalent discrete distributions by dividing them into a number of quantiles N. Quantile arithmetic is then used to performthe binary arithmetical operations corresponding to the logical gates in the Boolean expression of the top event expression of a given fault tree. The computational advantage of the present methodology as compared with the widely used Monte Carlo method was demonstrated for the cases of summation of M normal variables through the efficiency ratio defined as the product of the labor and error ratios. The efficiency ratio values obtained by the suggested methodology for $M = 2$ were 2279 for $N = 5$, 445 for $N = 25$, and 66 for $N = 45$ when compared with the results for 19,200 Monte Carlo samples at the 40th percentile point. Another advantage of the approach is that the exact analytical value of the median is always obtained for the top event.

16112 **Evaluating the safety of nuclear plant changes.** Bonaca, M.V.; Kai, M. (NUS Corp., Rockville, MD). *Transactions of the American Nuclear Society;* **53**: 402-403(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Once a reactor design has been shown to provide an acceptable level of public risk and the license is issued, it is the responsibility of the utility to maintain the design basis of the plant. This is a difficult job because of the many system modifications that take place and the determinations that must be made as to whether a modification constitutes a change in the design basis and requires a review by the NRC. The criteria for this determination are specified in the Code of Federal Regulations in section 10CFR50.59. The importance of understanding the relationship of this law to public safety is discussed in the paper. At Northeast Utilities, unilateral steps have been taken in clearly specifying definitions and quantifying limits for increase in probability, increase in consequences, and reduction in the margin of safety. The philosophy and implementation of their approach are discussed.

16113 **PROCESS - a source term calculation program for the PC.** Gil, T.K.; Hopkins, B. (Bechtel Gaithersburg, VA). *Transactions of the American Nuclear Society;* **53**: 419-421(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

PROCESS is a computer program that calculates radioisotope source terms resulting from various operations used in nuclear power plants. These generated source terms are then used in a shielding computer code called PIPEND which calculates the shielding required to assure protection against radiation. The major objective of development of a personal computer (PC) version of PROCESS was to reduce cost and time incurred during source term and shielding calculations. A portable IBM-PC or its compatibles allow these calculations at any time and location. Also, its user-friendly and simple operation allows one to become quickly familiar with the usage of the program.

16114 **MICROSHIELD - a microcomputer program for analyzing dose rate and gamma shielding.** Negin, C.A. (Grove Engineering). *Transactions of the American Nuclear Society;* **53**: 421-422(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Until recently, dose rate (exposure rate) and shielding effectiveness calculations have been conducted by specialists, either within an organization or by consultants. Now, the capability to perform these calculations is available to engineers and health physicists with desktop computers. MICROSHIELD is one program that provides this capability. The overall objective in creating MICROSHIELD was to provide a program that would relieve a user from the need to be a shielding analysis expert or to be familiar with how microcomputers operate. The goal was to allow a person to focus on the decision for which an analysis is required instead of on the analysis itself. The purpose of this paper is to describe some of the means by which this objective was achieved.

16115 **Reflection of gamma radiation in a spherical concrete-walled room.** Lahti, G.P.; Johnson, W.J.; Rich, J.M. (Sargent & Lundy, Chicago, IL). *Transactions of the American Nuclear Society;* **53**: 423-424(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A correlation of the in-containment monitor reading and airborne radioactivity within containment is useful in assessing radiological consequences of postulated power plant accidents. One accident of concern in the loss-of-coolant accident. A design-basis release from the core to the containment can be postulated and a time-dependent in-containment monitor response due to direct radiation can then be calculated using a fast-running point kernel code, but this calculation provides no estimate of wall-scattered radiation. The question presently addressed is the following: Is the wall-scattered radiation of sufficient importance to preclude use of the point-kernel method in this calculation? This study shows that a point kernel code can be used to calculate in-containment dose rates with errors of $<30\%$.

16116 **Gamma-scanning the primary shield cavity under the TMI-2 reactor vessel.** Rainisch, R.; Fricke, V.R.; Atkins, P.G. Jr. (Burn & Roe, Middletown, PA). *Transactions of the American Nuclear Society;* **53**: 424-426(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The March 28, 1979, accident at Three Mile Island Unit 2 (TMI-2) resulted in a significant mass of fuel debris (10 to 20 tonne) slumping into the bottom head of the reactor pressure vessel (RPV). It has been suggested that the lower shell could have been breached as a result of molten fuel slumping into the bottom head, which may have allowed fuel to escape into the primary shield cavity under the RPV. The primary shield cavity under the RPV was scanned to characterize the cavity, to determine if a significant deposit of fuel debris (i.e., 70 kg of UO_3) is within the cavity confines, and to support the characterization of the reactor building basement and the search for fuel outside the reactor coolant system. Prior to the reference scanning, key indicators, such as reactor coolant system pressure during and after the accident and measurements of in-core thermocouple lengths did not support the hypothesis of fuel escaping from the bottom of the vessel. However, no conclusive data existed on the lower head conditions and whether or not fuel escaped from this region. The scanning effort does not support the theory that a large quantity of fuel escaped through the RPV lower head.

16117 **Influence of gamma-ray skyshine on nuclear facilities design.** Ohta, M.; Tsuji, M.; Kimura, Y. (Toyo Engineering Corp., Tokyo, Japan). *Transactions of the American Nuclear Society;* **53**: 426-427(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In safety analysis of nuclear facilities, skyshine dose rate at site boundary is one of the most important shielding design problems. For nuclear power stations in Japan, the skyshine dose rate at the site boundary has been specified not to exceed 5 mR/yr by the authorities, including total dose contribution from all structures on site, and this guide is commonly applied to other nuclear fuel cycle facilities. Therefore the design criterion dose of each structure on site is, considering plot planning, shielding condition, and so on, defined as a value <5 mR/yr. The purpose of this study is to investigate how skyshine dose standards or other factors have an influence on the design of nuclear facilities, in a parametric survey of gamma-ray skyshine.

16118 **Operational radiation protection for reducing cumulative exposure at a boiling water reactor.** Parkyn, J.D. (Dairyland Power, La Crosse, WI). *Transactions of the American Nuclear Society;* **53**: 427(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The La Crosse boiling water reactor (BWR), due to the very small staff size, has had to develop, since mid-1982, a very vigorous dose reduction program in the operational area. This program has led to the involvement of operators and shift supervisors, as well as other management and bargaining union personnel in developing suggestions for both increasing the accuracy of operational dose assessment and in reducing total dose accumulation from operational activities. While there will continue to exist fluctuations in annual exposures based on maintenance requirements and equipment availability, it is very evident that an aggressive program of control at the La Crosse BWR has resulted in a significant annual reduction in total exposure. The personnel approach to radiation protection has been to enhance the use of dosimeters, particularly rate meters, to preplan jobs to a greater degree, and to be constantly aware of low-level back-ground radiations even when such observations lead to the removal and relocation of a significant amount of equipment.

16119 **Summary of safety relief valve position indication systems.** Cybulski, D.S.; Walter, J.F. *Transactions of the American Nuclear Society;* **53**: 438-439(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Mainly as a result of the Three Mile Island-2 (TMI-2) incident, the US Nuclear Regulatory Commission's Regulatory Guide 1.97 instituted criteria recommendations for monitoring variables to: 1. provide information required to permit the operator to take preplanned manual actions to accomplish safe plant shutdown; 2. determine whether...systems important to safety are performing their functions...; and 3. provide information to the operators that will enable them to determine the potential for causing a gross breach of the barriers to radioactivity release.... This report surveys the methodologies employed in nuclear plants to monitor Type D variables as referred to in Regulatory Guide 1.97. Type D are those variables that provide information to indicate the operation of individual safety systems and other systems important to safety. The specific Type D variable addressed is safety relief valve (i.e., spring style safety relief valve) position indication. The application criteria for each of the methodologies surveyed is as described in Regulatory Guide 1.97. That is, minimally to provide light indications of closed/not closed positions.

16120 **Identification of test candidates for investigating the survivability of electrical equipment during severe accidents.** Medford, G.T.; Kolaczkowski, A.M. (SAIC, Albuquerque, NM). *Transactions of the American Nuclear Society;* **53**: 439-440(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Associated with the ongoing process of resolving nuclear power plant severe accident issues, an effort was recently completed that investigated the survivability of electrical equipment used to mitigate accidents during representative severe environments. The overall objective of the work was to provide information that could be used to reduce one of the uncertainties in severe accident analyses; i.e., whether electrical equipment used to mitigate accidents could be reasonably relied on while subject to a severe accident environment. This work centered on recommending electrical equipment within a boiling water reactor (BWR)-4 Mark I containment most worthy of survivability testing. The recommendation was based on the equipment's importance to mitigating severe accidents and the environments encountered relative to current equipment qualification requirements. A methodology was established to arrive at this recommendation. The methodology is described.

16121 Ex-core water-level monitor: comparison of computations with LOFT data. Markoff, D.; DeVolpi, A.; Prussin, S. (Univ. of California, Berkeley). *Transactions of the American Nuclear Society;* 53: 441-443(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The unambiguous, easy-to-interpret indication of inadequate core cooling throughout a reactor vessel is considered important to plant safety function. After the Three Mile Island-2 incident, research was undertaken on a variety of means to monitor coolant inventory. However, questions of survivability and uniqueness of response remain, resulting in continued exploration of ex-core methods. This paper reports on a water-level instrument that is situated outside the reactor vessel and is designed to give separate information on the core and downcomer levels at full power and long after scram. An axial array of gamma detectors has been proposed for this application. The apparatus concentrates on detection of high-energy gamma rays produced by neutron capture in hydrogen and steel. Under these conditions, it would be possible to monitor the coolant level from outside the pressure vessel and therefore be survivable under accident conditions; it would not need vessel penetrations, nor would maintenance requirements be excessive. By concentrating on the high-energy gamma rays and by collimating the detectors, background would be reduced. The collimation also permits separate monitoring of downcomer and core liquid-level conditions and allows vertical resolution of coolant inventory and density over the full vessel height.

16122 New time-line technique for station blackout core-melt analysis. Stutzke, M.A. (Florida Power Corp., St. Petersburg). *Transactions of the American Nuclear Society;* 53: 444-445(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Florida Power Corporation (FPC) has developed a new method for analyzing station blackout (SBO) core-melt accidents. This method, created during the recent probabilistic risk assessment (PRA) of Crystal River Unit 3 (CR-3), originated from the need to analyze the interactions among the two-train emergency feedwater (EFW) system, station batteries, and diesel generators (DGs) following a loss of off-site power (LOSP) event. SBO core-melt sequences for CR-3 are unique since the time core-melt commences depends on which DG fails last. The purpose of this paper is to outline the new method of analysis of SBO core-melt accidents at CR-3. The significance of SBO core-melt accidents to total plant risk, along with the efficacy of various methods to reduce SBO risk, are also discussed.

16123 Loss of pressurizer water level during station blackout. Griggs, D.P.; Riggs, B.K. *Transactions of the American Nuclear Society;* 53: 445-446(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Station blackout is the loss of all alternating current (ac) power to both the essential and nonessential electrical buses in a nuclear power plant. The US Nuclear Regulatory Commission (NRC) has proposed a requirement that all plants be capable of maintaining adequate core cooling during station blackout events lasting a specified duration. The NRC has also suggested acceptable specified durations of four or eight hours, depending on individual plant susceptibility to blackout events. In a pressurized water reactor (PWR), the occurrence of a station blackout event results in the functional loss of many plant components, including main feedwater, reactor coolant pumps, the emergency core cooling system, and pressurizer heaters and spray. Nevertheless, PWRs have the capability of removing decay heat for some period of time using steam-driven auxiliary feedwater pumps and the natural-circulation capability of the primary system. The purpose of this investigation is to determine the early response of a PWR to station blackout conditions. In particular, the effect of primary coolant shrinkage and inventory loss on pressurizer level is examined to gain insight into the operational and analytical issues associated with the proposed station blackout coping requirement.

16124 Emergency diesel generator reliability at US nuclear power plants. Wyckoff, H.L. (Electric Power Research Institute, Palo Alto, CA). *Transactions of the American Nuclear Society;* 53: 446-447(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

During the past several years the nuclear power industry and the US Nuclear Regulatory Commission (NRC) have had efforts under way to better determine the risk from station blackout at nuclear power plants. Two of the important elements of this effort have been to accurately determine the reliability of off-site and of emergency on-site alternating current (ac) power sources. With respect to off-site alternating current (ac) power sources. With respect to off-site power, the Electric Power Research Institute (EPRI) has prepared an accurate data base of events where all off-site power was lost at US nuclear plants and is updating it on a continuous basis. It shows that overall, off-site power reliability is excellent. During the three years 1983, 1984, and 1985, there were 0.075 losses per site year of all durations and only 0.023 losses per site year that were longer than 30 min. The relative unreliability performance of the start phase compared to the load-run phase merits special note. Load-run unreliability is consistently higher than start-phase unreliability. The spread ranges from a factor of 2 to a factor of 4.

16125 Determination of station blackout frequency-duration relationships. Griggs, D.P.; Riggs, B.K.; Balakrishna, S. *Transactions of the American Nuclear Society;* 53: 447-449(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Station blackout is the loss of all alternating current (ac) power to the essential and nonessential electrical buses in a nuclear power plant. This generally involves the loss of redundant off-site power sources and the failure of two or more emergency diesel generators (EDGs). The US Nuclear Regulatory Commission (NRC) has proposed requiring all commercial reactors to have the capability of coping with a station blackout of a specified duration. The NRC has also proposed 4 or 8 h as acceptable durations, depending on plant susceptibility to the occurrence of station blackout events. Analyses were performed to determine expected station blackout frequencies representative of a majority of domestic nuclear power plants. A methodology based on that developed by the NRC was used. Representative industry data for loss of off-site power (LOOP) events and EDG reliability were used in the analyses.

16126 Modeling of Ge(Li) gamma-ray spectra. Harris, R.D.; Binney, S.E. (Oregon State Univ., Corvallis). *Transactions of the American Nuclear Society;* 53: 166-167(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of this work was to develop a model of monoenergetic gamma-ray spectra that were experimentally measured with a Ge(Li) detector counting system. A number of notable investigations have attempted all or part of this task with varying degrees of success. This model was incorporated into the FORTRAN computer program SPECTRA, which can be used to calculate the expected spectrum of gamma-ray sources when it would otherwise be impractical or impossible to measure the actual sources. The calculated and measured spectra for a 1779-keV (^{28}Al) gamma-ray are shown. The model fits the experimental data fairly well. As indicated earlier, this technique can be used to calculate complex gamma-ray spectra mathematically as a linear combination of a series of monoenergetic gamma-ray spectra. For example, program SPECTRA has been used to calculate the fission product spectrum of the reactor coolant after a pressurized water reactor (PWR) design basis accident.

16127 Integrated defueling system for Three Mile Island Unit 2. Brown, D.A.; Gallagher, R.E.; Rider, R.L. (Bechtel Western). *Transactions of the American Nuclear Society;* 53: 502-503(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The unique clean-up requirements of Three Mile Island Unit 2 have posed first-of-a-kind challenges for the equipment, tools, and operators involved in the defueling effort. Various equipment components and specialty remote tools were designed as an integrated defueling system to provide a means of safely working above the reactor and removing core debris. The basic defueling system consists of support equipment and specialty remote tools for specific operations. This paper describes the different equipment and tools, and explains the key interfaces and features of the integrated defueling system.

16128 **Design rationale for a remote work vehicle.** Whittaker, W.L. *Transactions of the American Nuclear Society;* 53: 503-504(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The remote work vehicle (RWV) is a mobile, teleoperated, electrohydraulic robot designed for aggressive, radiological decontamination work. The RWV performs tasks such as washdown, sampling, material packaging and transport, surfacing, and demolition. This paper discusses the design rationale that shaped the development of the RWV with respect to capability, reliability, operability, decontaminability, extensibility, and maintainability. To meet an important subset of nuclear damage recovery tasks, the design embraced these often competing ideals.

16129 **Robotics development at TMI-2.** Bengel, P.R.; Giefer, D.L.; Levesque, R.G. (GPU Nuclear Corp., Middletown, PA). *Transactions of the American Nuclear Society;* 53: 504-505(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A remote reconnaissance vehicle (RRV) was initially developed to visually and radiologically survey the Three Mile Island Unit 2 (TMI-2) reactor building basement, which is not accessible to workers because radiation levels are extremely high (i.e., 10 to 1000 R/h). By mid-1985, the RRV had completed surveillance and sludge sampling missions that demonstrated its utility and suggested that the RRV could be modified to perform more aggressive sampling and decontamination work. This paper discusses the design criteria and operational experiences that GPU Nuclear Corporation (GPUNC) has had with expanding the use of the RRV to take concrete core bores, perform gross flushes, and remove sediment from the reactor building basement. The basic RRV unit is shown. This six-wheeled vehicle weighs ~224 kg (600 lb) and is powered by two 1/2-hp motors. Its power, control signals, and video transmissions pass through a thin-layered cable that winds around a reel located on the RRV.

16130 **Operational experiences with a remote core-boring device.** Kreider, K.A.; McGarry, J.J. (Bectel, Middletown, PA). *Transactions of the American Nuclear Society;* 53: 505-506(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The 1979 accident at Three Mile Island Unit 2 (TMI-2) dispersed fission products throughout the plant. Radiological surveys taken in the reactor building in 1982 indicated that a substantial portion of that contamination was embedded in the nuclear-grade coatings used to paint structural surfaces. The loss-of-coolant accident resulted in the discharge of highly radioactive water from the reactor coolant system into the reactor building basement (elevation 282 ft, 6 in.). The water in the basement reached a height of ~8 ft, exposing all submerged surfaces to soluble contaminants. This water remained for ~18 months until most of it was removed and processed via the submerged demineralizer system. As decontamination efforts progressed it was deemed necessary to obtain wall core samples from the basement to determine the depth of contaminant penetration into the concrete. These data would in turn aid in planning and selecting various decontamination methods for the 282-ft, 6-in, elevation walls. This paper describes the use of a teleoperator to obtain core-bore samples from the walls of the TMI-2 reactor building's 282-ft, 6-in. elevation. The teleoperator extracted core-bores from a hostile environment with general area radiation levels of ~66 R/h, hot spots of 1130 R/h, and high levels of surface contamination.

16131 **Tomorrow's mobile robots in today's nuclear power plants.** McDermott, K.J.; Pavelek, M.D. II; Roman, H.T. (New Jersey Institute of Technology, Newark). *Transactions of the American Nuclear Society;* 53: 507-(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A primary motivation for utilizing robots in nuclear power plants is maintenance economics and the nuclear industry's concern with reducing personnel radiation exposure to as low as reasonably achievable as recommended by the US Nuclear Regulatory Commission (NRC). Recent studies by Battelle Columbus Laboratories, the Electric Power Research Institute, the NRC and others indicate that robots for surveillance and inspection can be retrofitted into existing boiling water reactor and pressurized water reactor plants, but economics must be evaluated on a case-by-case, site-specific basis, because nuclear power plants in the US are usually different in design. Application areas or robot functions being considered are broad and range from primary containment inspection, reactor maintenance, routine health physics tasks, and various operation and maintenance procedures, to facility decontamination and decommissioning, and post-accident recovery such as at Three Mile Island Unit 2. This paper will discuss the general use of robotic devices in nuclear power plants, the pioneering use of robotics technology at Three Mile Island nuclear power plant, and the field testing of mobile robots at Public Service Electric and Gas Company's Salem and Hope Creek nuclear plants.

16132 **Oyster Creek RETRAN model benchmark to pressure and level perturbation tests.** Alammar, M.A. (GPU Nuclear Corp., Parsippany, NJ). *Transactions of the American Nuclear Society;* 53: 530-531(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

As part of GPU Nuclear's program to establish an in-house reload capability for Oyster Creek, the RETRAN-02 MOD4 SPL Computer Code has been chosen to analyze Chapter 15 Final Safety Analysis Report transients. To qualify Oyster Creek RETRAN model, a series of startup tests has been chosen to benchmark the model. Two of those tests, involved water level and vessel pressure perturbations at 100% power. Both tests were analyzed using point kinetics and one-dimensional kinetics with no noticeable impact on level or pressure. A small impact was noticed on power but was thought to be of minor significance. This is because for such mild transients the neutron flux shape function does not change appreciably throughout the transient.

16133 **Correlation for predicting reactor power during a BWR ATWS.** Chexal, B.; Layman, W. (EPRI, Palo Alto, CA). *Transactions of the American Nuclear Society;* 53: 531-532(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

An anticipated transient without scram (ATWS), while of low probability, has received much attention because of its potentially serious consequences. Under certain ATWS sequences for a boiling water reactor (BWR), it would be desirable to reduce system power, particularly where the primary system has been isolated by closure of all main steam isolation valves and is discharging steam through its safety/relief valve system to the suppression pool. Reducing reactor power increases the time available to shut down the reactor by minimizing the heat dumped to the suppression pool and thereby helping to keep the suppression pool temperature and the containment stresses with limits. This paper describes the correlation developed to provide the degree of power reduction which can be achieved for a BWR during ATWS conditions by intentionally reducing the system coolant inventory and pressure. Under proposed emergency procedure guidelines for the ATWS event, the reactor water level would be lowered to reduce system power. The correlation is based on three-dimensional quasi-static analysis based on Electric Power Research Institute computer codes NATBWR and verified by the transient code RETRAN-02.

16134 **Modifications and assessment of rewetting correlations for light water reactor system analysis.** Hassan, Y.A. (Texas A & M, College Station). *Transactions of the American Nuclear Society;* 53: 537-539(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The qualitative aspects of reflood heat transfer in the system codes [e.g., RELAP5/MOD2, TRAC-PF1/MOD1, COBRA-TF, etc.] can be represented with a generalized boiling curve. The anchor points used to specify the boiling curve are the critical heat flux (CHF) temperature (T/sub CHF/) and the minimum flow boiling temperature (T/sub min/). The cooldown during the quenching process is affected by the minimum film boiling heat flux. This aspect of the quenching process has not been studied as much as the CHF phenomenon. The purpose of this paper is to compare several rewetting correlations. These correlations were implemented in a special version of RELAP5/MOD2 computer code. Good comparison between several FLECHT-SEASET data and predicted rewetting temperatures was obtained when a new modified formulation of Henry rewetting correlation was used to account for the mass rate dependence.

16135 **Effect of bubbly/slug interfacial shear on liquid carryover predicted by RELAP5/MOD2 during reflooding.** Analytis, G.T.; Richner, M. (EIR, Wuerenlingen, Switzerland). *Transactions of the American Nuclear Society;* 53: 540-541(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Analysis of very low flooding rate reflooding experiments and one boiloff experiment in the 33 electrically heated rod bundle NEPTUN at EIR with RELAP5/MOD2/36.02 has shown that the code grossly overpredicts the liquid carryover. Similar results have been reported in the analysis of a large number of boiloff experiments in NEPTUN with TRAC-BD1/MOD1. In this case, the differences between measurements and predictions were attributed to the large bubble/slug interfacial shear in TRAC-BD1 and excellent agreement with the measurements was achieved by implementing in this code a slightly modified version of a new bubbly/slug interfacial shear correlation developed for rod bundles. As far as reflooding is concerned, one of the most crucial parameters for the correct prediction of the rod surface temperature histories is the interfacial shear f/sub i/ in the different flow regimes; it is precisely this term that will largely determine the liquid fraction at a certain axial elevation, and the liquid carryover. In the paper, the authors outline the implementation of the new bubble/slug f/sub i/ correlation in RELAP5/MOD2/36.02 and assess its influence in the liquid carryover in the analysis of low flooding rate experiments in NEPTUN.

16136 **Experimental and theoretical investigation of a phase-change front-prediction method.** Chun, M.H.; Choi, H.O.; Kim, Y.S. *Transactions of the American Nuclear Society;* 53: 541-543(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The phenomena of liquid-solid phase change have been extensively studied for the latent heat-of-fusion energy storage design, the assessment of molten-fuel relocation following hypothetical core-disruptive accidents in liquid-metal fast breeder reactors, casting of metals, and desalination of water. The major characteristics of the melting and freezing problems include the movement of a phase boundary by the diffusion of energy or mass, and the nonlinearity associated with the moving phase boundary extremely complicate its analysis. The purpose of the present study is to examine the usefulness of the proposed method of the phase-change-front prediction based on the optimization technique by application to a special case. This paper describes a combined experimental and theoretical study of the phase change front when solidification of an initially stagnant superheated molten fluid occurs on the outside wall of a convectively cooled vertical tube show.

16137 **Model for stratified flow in a CANDU reactor header manifold.** Gulshani, P. (AECL, Sheridan Park, Ontario). *Transactions of the American Nuclear Society;* 53: 553-555(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The core of the Canada deuterium uranium (CANDU) reactor consists of many horizontal pressure-tube-type fuel channels each connected by feeder pipes to common inlet and outlet horizontal headers above the core. The feeder nozzle connections at the header are at different elevations around the header circumference. The headers are connected to the steam generators and the emergency-core-cooling (ECC) system. For a small-break loss-of-coolant accident with delayed or unavailable ECC, two-phase (steam-water) coolant is eventually predicted in the inlet header as the primary inventory decreases. The possibility of coolant stratification in the header resulting in steam cooling of the fuel channels with feeder nozzles at the header in the steam phase needs to be studied. Tests are ongoing in the full-scale header facility at Westinghouse Canada to provide experimental information on the header manifold flow behavior. A series of single-phase water and two-phase steam-water, steady-state header injection tests was recently done, and results to data are discussed.

16138 **Assessment of the heat transfer models in the TRACB02 code.** Chu, K.H.; Andersen, J.G.M.; Shiralkar, B.S. (General Electric Co., San Jose, CA). *Transactions of the American Nuclear Society;* 53: 555-556(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

TRACB02 is a computer code developed at General Electric Company (GE) in a collaboration with the Idaho National Engineering Laboratory for best-estimate analysis of the thermal-hydraulic conditions in a boiling water reactor (BWR). This development effort was jointly funded by the US Nuclear Regulatory Commission/Electric Power Research Institute/GE. TRAC features a high degree of modularity to allow for the simulation of almost any system. The basic physical phenomena are described by the conservation equations for mass, momentum, and energy. The heat transfer mechanisms modeled include single-phase convection, nucleate and sub-cooled boiling, boiling transition and rewet, post-dryout heat transfer, thermal radiation, and interfacial heat transfer to droplets, bubbles, and films. The heat transfer models are tied to the interfacial shear model through a consistent flow regime map. The assessment was performed by simulating a set of separate effects tests with TRACB02 and then comparing the results with data. Results of the assessment studies are summarized.

16139 **Corium droplet size in direct containment heating.** Sienicki, J.J.; Spencer, B.W. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* 53: 557-558(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

For those light water reactor severe accident sequences in which molten corium is postulated to melt through the reactor pressure vessel (RPV) lower head at elevated primary system pressure and enter the cavity region beneath the vessel, the flow of corium from the RPV will be followed by a sustained high-pressure blowdown of steam and hydrogen through the breach remaining in the vessel. The gases flowing from the breached vessel constitute a source of driving forces capable of dispersing corium from the cavity as droplets into other parts of the containment. An important issue is the fraction of the dispersed corium thermal and chemical energy which may be transferred directly to the containment atmosphere. An important determinant of the extent of direct containment heating is the size of the corium droplets which are dispersed into the containment atmosphere. An analysis is presented here of the mass median droplet sizes in the Argonne National Laboratory CWTI-13 and CWTI-14 reactor material-direct containment heating experiments as well as the Sandia National Laboratory SPIT-19 thermite test. The observed median droplet diameters are shown to be in good agreement with a correlation for the drop size in ordinary annular flow, and a droplet size prediction is carried out for the reactor system.

16140 **Application of a direct-heating model to the Sandia SURTSEY tests.** Pong, L.C.; Huhtiniemi, I.; Corradini, M.L. (Univ. of Wisconsin, Madison). *Transactions of the American Nuclear Society;* 53: 558-559(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the event of a severe light water reactor accident which involves fuel melting at high primary system pressures the direct heating of the containment atmosphere is an important physical process to consider. This would occur as the fuel, which has slumped from the core into vessel lower plenum, fails the reactor pressure vessel (RPV) wall and is discharged under high pressure into the reactor cavity below the vessel. As the fuel and high-pressure gases are discharged from the RPV the fuel can be entrained in the gas flow and dispersed as droplets into the containment atmosphere. The heating of the atmosphere by the sensible heat of the fuel droplets as well as possible chemical reactions of the fuel with the gases may threaten containment integrity. A series of experiments is being planned at Sandia (SURTSEY) to understand this direct heating phenomenon. In the paper the authors present a pre-test calculation of the first SURTSEY test (DCH-1) using a recently developed direct heating model (DIRHET). This model will be compared to the SURTSEY test data to verify its applicability and is being used in scoping calculations for containment direct heating.

16141 **Direct-heating containment vessel interaction code (DHCVIC) and prediction of SNL SURTSEY test DCH-1.** Ginsberg, T.; Tutu, N. (Brookhaven National Lab., Upton, NY). *Transactions of the American Nuclear Society;* **53**: 559-601(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

High-pressure melt ejection from pressurized water reactor (PWR) vessels has been identified as a severe core-accident scenario which could potentially lead to early containment failure. Melt ejection, followed by dispersal of the melt by high-velocity steam in the cavity beneath the PWR vessel could, according to this scenario, lead to rapid transfer of energy from the melt droplets to the containment atmosphere. This paper describes DHCVIC, an integrated model of the thermal, chemical, and hydrodynamic interactions which are postulated to take place during high-pressure melt ejection sequences. The model, which characterizes interactions occurring within the reactor cavity, as well as in the containment vessel (or building), is applied to prediction of the Sandia National Laboratory (SNL) SURTSEY Test DCH-1 and a (post-test) prediction of that test is made.

16142 **Heat radiation through steam in direct containment heating.** Condiff, D.W.; Cho, D.H.; Chan, S.H. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* **53**: 561-562(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Current risk studies of light water reactors include analysis of phenomena associated with severe accident sequences. These sequences include low probability events in which molten core materials escape in high-system-pressure situations into regions below the reactor pressure vessel, are fragmented into droplets, and swept by blowdown steam (and hydrogen) into the containment atmosphere in sufficient atmosphere. The dispersed molten core droplets could release their latent and sensible heats as well as chemical oxidation energy directly to containment atmosphere in sufficient quantities to cause overpressurization. This study extends understanding of such direct containment heating phenomenology by examining the disposition of heat radiated from the dispersed high-temperatures droplets.

16143 **Surry severe-accident containment load calculations using HMC.** Pong, L.C.; Corradini, M.L.; Moses, G.A. (Univ. of Wisconsin, Madison). *Transactions of the American Nuclear Society;* **53**: 562-563(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In a nuclear reactor, the containment represents the final barrier to fission product release following a severe accident. The timing and manner of containment loading are important in determining if a failure occurs and the magnitude of radioactivity release. A variety of computer models have been developed to analyze severe accidents and in particular the containment. Recently, physical processes are of interest involving fuel/coolant interactions, hydrogen combustion, and direct heating following reactor pressure vessel (RPV) breach with containment feedback. Based on this need the HMC code was developed. In this paper the authors discuss scoping calculations using HMC to investigate containment loads for the Surry reactor under a variety of parametric boundary and initial conditions (low and high RPV pressures) at a time of vessel breach.

16144 **Containment loads due to hydrogen combustion.** Berman, M.; Lee, J.H.S. (Sandia National Labs., Albuquerque, NM). pp 126-129 of Proceedings of the international conference on containment design. Black, R.K. Toronto, Ontario; The Canadian Nuclear Association (1984). (CONF-840628—). Contract AC04-76DP00789.

From International conference on containment design; Toronto, Ontario, Canada (17 Jun 1984).

Certain results of a research program on the impact of hydrogen combustion in nuclear reactor safety carried out at Sandia National Laboratory and McGill University are reviewed in this paper. In particular, investigations of hydrogen diffusion flames, closed volume combustion of hydrogen and the influence of turbulence, flammability limits of hydrogen-air-steam mixtures, high speed deflagrations and detonations, and computer modelling of turbulent flame accelerations are described.

16145 **SSYST: A code-system for analyzing transient LWR fuel rod behaviour under off-normal conditions.** Borgwaldt, H.; Gulden, W. (Kernforschungszentrum Karlsruhe, Postfach 3640, D-7500 Karlsruhe). pp 663-686 of Water reactor fuel element performance computer modelling. Gittus, J. New York, NY; Elsevier Science Pub. Co. Inc. (1983).

SSYST is a code-system for analyzing transient fuel rod behaviour under off-normal conditions, developed conjointly by the Institut fur Kernenergetik und Energiesysteme (IKE), Stuttgart, and Kernforschungszentrum Karlsruhe (KfK) under contract of Projekt Nukleare Sicherheit (PNS) at KfK. The main differences between SSYST and similar codes are an open-ended modular code organization, and a preference for simple models, wherever possible. While the first feature makes SSYST a very flexible tool, easily adapted to changing requirements, the second feature leads to short execution times. The analysis of transient rod behaviour under LOCA boundary conditions takes 2 min cpu-time (IBM-3033), so that extensive parametric studies become possible. This paper gives an outline of the overall code organisation and a general overview of the physical models implemented. Besides explaining the routine application of SSYST in the analysis of loss-of-coolant accidents, examples are given of special applications which have led to a satisfactory understanding of the decisive influence of deviations from rotational symmetry on the fuel rod perimeter.

16146 **A model for fission product distribution in CANDU fuel.** Muzumdar. (Nuclear Studies and Safety Dept., Ontario Hydro, 700 University Avenue, Toronto, Ontario). pp 559-574 of Water reactor fuel element performance computer modelling. Gittus, J. New York, NY; Elsevier Science Pub. Co. Inc. (1983).

This paper describes a model to estimate the distribution of active fission products among UO/sub 2/ grains, grain boundaries, and the free void spaces in CANDU fuel elements during normal operation. This distribution is required for the calculation of the potential release of activity from failed fuel sheaths during a loss-of-coolant accident. The activity residing in the free spaces ('free' inventory) is available for release upon sheath rupture, whereas relatively high fuel temperatures and/or thermal shock are required to release the activity in the grain boundaries or grains. A preliminary comparison of the model with data from in-reactor sweep-gas experiments performed in Canada yields generally good agreement, with overprediction rather than unprediction of radiologically important isotopes, such as I/sup 131/. The model also appears to generally agree with the 'free' inventory release calculated using ANS-5.4.

25 ENERGY STORAGE

2505 Flywheels

16147 (NP—7770051) Fast-running permanent-magnet synchronous engine with small idle losses for kinetic energy storage systems. Guentensperger, W. (Eidgenoessische Technische Hochschule, Zurich (Switzerland)). 1984. 188p. (In German). NTIS (US Sales Only), PC A09/MF A01. File Number DE87770051.

In the first part of this thesis, the basics of kinetic energy storage systems are examined with regard to the specific requirements of an electric driving machine. This machine must be able to have a wide range of speed, high peak-power capability and small idling losses. Because of the high rim-velocity of the flywheel, the rotating system is working at reduced ambient pressure. In this case the machine has to be equipped with a separate cooling system. The reluctance- and the homopolar machine have been proposed often before for flywheel drives. Through a special arrangement (rotating magnetic circuit and stationary winding in the air gap), it is possible to eliminate the iron losses of a permanent-magnet synchronous machine. The main part of this investigation consists of the calculations for the development of such a permanent synchronous machine. It is devided in the following sections: Stress analysis of the rotating part; calculation of the magnetic field and optimizing the geometry of the machine; optimizing the form of the winding; design of the cooling-circuit; calculation of the electrical parameters and efficiency of the machine. The details of the constructions are given in a separate chapter. The machine was tested in the laboratory to verify the calculations. The results gave many indications for further development of such a machine. Measurements and interpretations were made with a digital computer.

From Electrochemical Society fall meeting; San Diego, CA, USA (19 Oct 1986).

Mathematical modeling has been an efficient and powerful tool for evaluating thermal behavior of batteries and electrochemical cells. In this paper, the methodology and applications of thermal modeling in various battery systems are reviewed. Potential needs and extensions of battery thermal modeling are discussed.

16149 (CONF-8610122—13) Temperature effects on nickel/iron battery characteristics. DeLuca, W.H.; Tummillo, A.F.; Biwer, R.L.; Hornstra, F.; Christianson, C.C. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 8p. NTIS, PC A02. File Number DE87004930.

From 8. international electric vehicle symposium ↑; 0.

The performance of an improved Ni/Fe electric vehicle battery applications was measured at ambient temperatures of 0, 25 and 50°C for a range of overcharge levels (3 to 80%), open-circuit stand times (0 to 4 h), and charge (1 to 6 h) and discharge (1 to 3 h) rates. Charges and discharges were also performed at different battery operating temperatures to differentiate the effects of temperature on battery charge acceptance and available discharge capacity. The results show that the discharge capacity increases with an increase in the operating temperature, but that the charge acceptance is maximal at 25°C.

16150 Lithium alloy/iron sulfide batteries. Nelson, P.A.; Shimotake, H. (Chemical Technology Div., Argonne National Lab., 9700 South Cass Avenue, Argonne, IL 60439-4837). pp 150-154 of Progress in batteries and solar cells. Cleveland, OH; JEC Press Inc. (1987). Contract W-31-109-ENG-38.

Lithium alloy/FeS cells with a theoretical capacity of 200-400 Ah have been developed. These cells have achieved high specific energy (100 Wh/kg), high power (150 Wh/kg), and long life (1,000 cycles). Electrode experiments and design studies indicate the possibility of improving specific energy and power by 50 to 100 percent and, perhaps, retaining cycle life.

16151 Improved reliability of Li/SO/sub 2/ cells through use of an automated inspection system. Levy, S.C.; Herrig, D.M. (Exploratory Batteries Div., Sandia National Labs., Albuquerque, NM 87185). pp 98-100 of Progress in batteries and solar cells. Cleveland, OH; JEC Press Inc. (1987).

Sandia National Laboratories is using Li/SO/sub 2/ batteries in an application requiring five years of continuous operation with a high degree of reliability. To meet the application requirements, commercial Li/SO/sub 2/ cells were modified to eliminate parasitic corrosion reactions leading to premature failure. The Sandia modified Li/SO/sub 2/ cells are manufactured by two suppliers and have shown a significant improvement in multi-year discharges over the standard commercial design. However, variations are observed in cell performance within and between individual lots. To improve the overall reliability of each lot, 100% acceptance tests are performed. These tests consists of open circuit voltage, weight and dimensional measurements. A study is underway to define other nondestructive measurements which may be used to predict cell performance. To speed up the acceptance process and further improve the product reliability by eliminating human errors, a robotic workstation was conceived.

29 ENERGY PLANNING AND POLICY

2901 Energy Analysis And Modeling

REFER ALSO TO CITATION(S) 15362, 16170

16152 (ESC-WR—86-18) Research on and applications of non-linear costs functions in the Dutch energy models SELPE and DELPE. Van Dasler, H.C. (Stichting Energieonderzoek Centrum Nederland, Petten. Energie Studie Centrum). Aug 1986. 175p. (In Dutch). Energie Studie Centrum ECN, P.O. Box 1, 1755 ZG Petten, Netherlands.

The Energy Study Centre of the Netherlands Energy Research Foundation ECN has developed a long term energy model SELPE (Static ESC Linear Programming Energy model). Characteristic of this model is the assumption that all relations are linear. For certain cost categories this is only a first order approach. A non-linear approach has been made for extraction costs functions of energy sources as well as for investment costs functions of energy processes. Calculations have been executed with the adjusted model SELPE and with the dynamic version of SELPE, called DELPE. If non-linear investment costs functions were used calculations have been done with the help of mixed integer programming. Calculation results turned out to be realistic and useful. 16 refs.

16153 (NP—7750866) Possibilities of longterm improvement of the structure of the energy supply in West Germany. Summary. Casser, E.; Goy, G.C.; Labahn, K.D.; Wittke, F.; Ziesing, H.-J.; Schmitt, D.; Ciesiolka, J.; Gommersbach, M.; Schulz, W.; Suding, P.H. (Deutsches Inst. fuer Wirtschaftsforschung, Berlin (Germany, F.R.); Koeln Univ. (Germany, F.R.). Energiewirtschaftliches Inst.; Rheinisch-Westfaelisches Inst. fuer Wirtschaftsforschung, Essen (Germany, F.R.)). Apr 1982. 37p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE87750866.

The aim of the detailed investigations was to analyse and assess the energy policy options, by which the structure of the energy supply can be improved. Aids to decision making were worked out from selected, specially relevant examples. Conditions and consequences are shown, and also the possible solutions in the overall context. The questions arising from the previous development and present structure of the energy supply system in West Germany are dealt with first. After the analysis of structural development (final energy consumption of households, traffic, small users, industry), there is an assessment of the main characteristics of

this development against the background of energy policy aims with the following aspects: security of supply, rational, economical and environmentally acceptable use of energy, adaptability of the existing energy system to changed conditions of energy supply. (HWJ).

16154 **(ORNL—5947) Energy division: Annual progress report for period ending September 30, 1982.** (Oak Ridge National Lab., TN (USA)). Jun 1983. Contract W-7405-ENG-26. 199p. NTIS, PC A09/MF A01. File Number DE83015056.

REFER ALSO TO CITATION(S) 15637, 15660, 16152, 16154, 16167, 16489, 17505, 17590, 17592

16155 **(DOE/EIA—0206(85)) Performance profiles of major energy producers, 1985.** (USDOE Energy Information Administration, Washington, DC. Office of Energy Markets and End Use). 15 Jan 1987. 147p. NTIS, PC A07/MF A01 - GPO; 1; GPO Dep. File Number DE87004814.

Pursuant to Section 205(h)(2) of the Department of Energy Organization Act, the Energy Information Administration, through Form EIA-28, has collected financial information and other measures of energy-related business efforts and results for 22 major energy companies on a uniform, segmented basis (the merger of Cities Service with Occidental Petroleum in 1982 reduced the number of reporting companies from 26 to 25 beginning in 1983, and the 1984 mergers of Chevron with Gulf Oil, Mobil with Superior Oil, and Texaco with Getty Oil reduced the number of reporting companies to 22 beginning with the 1985 reporting year). Comparability of information across energy lines of business is unique to this reporting system. For example, petroleum activities can be compared to activities in other energy lines of business or nonenergy areas, and domestic activities can be contrasted to foreign activities. The purpose of this publication is to examine year-to-year developments in the operations of the 22 major US energy-producing companies on a corporate level, by major line of energy business, and by major functions within each line of business. Although the focus is on developments in 1985, important trends over the 1974 through 1985 period are also featured. Economic performance, in financial and physical dimensions, continues to serve as a significant factor in evaluating past decisions and guiding future options in the development and supply of energy resources. The information contained in this report is intended to promote an understanding and a critical review of the possible motivations and apparent consequences of investment decisions by some of the largest corporations in the energy industry. The information is intended for use by the Congress, Government agencies, industry analysts, and the public.

16156 **(AD-A—174346/7/XAB) Hazardous-waste management: a descriptive study. Master's thesis.** Drewett, G.M. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Systems and Logistics). Sep 1986. 95p. (AFIT/GEM/DEM—86S-9). NTIS, PC A05/MF A01.

The increased emphasis and enforcement of the RCRA regulations by the US EPA has prompted AF managers to reevaluate base-hazardous waste management activities. This research effort provides management with a profile of the current state of affairs of waste management within the Air Force community. This profile provides the necessary baseline data for managers to develop and support future hazardous-waste-management initiatives. A census of all CONUS base environmental Coordinators was used to identify existing base hazardous-waste-management practices. The data obtained in this research effort identified three major problem areas: 1) Inadequate environmental planning, 2) Inadequate waste-storage facilities, and the 3) Lack of EPC involvement in the base's hazardous-waste-management program. Additional research into the underlying reasons for this lack of EPC support is recommended.

16157 **(NP—7770046) Problems of decision-making in the fields of biology and ecology under the aspect of environmental policy.** Krause, A. (Freiburg Univ. (Germany, F.R.). Forstwissenschaftliche Fakultaet). Jun 1984. 329p. (In German). NTIS (US Sales Only), PC A15/MF A01. File Number DE87770046.

This study looks into political and administrative mechanisms and effects in the classical area of 'Conservation of nature and care of the landscape' for the area of the Federal Republic of Germany between 1969 and 1980. The overall question asked in this respect is: In how far have governments succeeded to get away from a policy of merely repairing damage and adopted a concept of future-oriented biological and ecological preventive care. This is followed by the questions: How to combine influences and factors in this areas in such a way that popular measures and long-term declarations of intent are translated into practice so as to guarantee a continuous development of environmental policy strategies. The author comes to the conclusion that a special governmental agency ought to be set up whose staff is organized in working teams for each region and is thus able to fruitfully combine the political objectives with the claims of the people. As this agency would not be a part of any local government it would not be tied down by short-term political vested interests but could make decisions which do justice to the subjects at stake. Conservation of nature and care of the landscape will be efficient only if there are sufficient instruments, clearly formulated aims, adequate institutions with qualified staff and a general acceptance of the latter. (orig./HSCH).

16158 **(BNL—39110) Brookhaven National Laboratory: Technology transfer report, Fiscal year 1983.** (Brookhaven National Lab., Upton, NY (USA)). 1983. Contract AC02-76CH00016. 54p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87005255.

One of Brookhaven's primary missions has been the construction and operation of large facilities for basic research. The Laboratory has always been cognizant of, and has taken pride in, the transfer of technologies associated with the design, construction, operation or utilization of the facilities; and with the technology developed from all of our basic and applied research programs. Although, in the past, the technology transfer process has not been formalized, the technologies developed here have been continuously diffused into the American economy. Some examples are medical isotopes, most notably technetium-99, and much of the early light water reactor technology based upon BNL's work with its first research reactor and with its critical assembly facility. Now the Laboratory has formalized the process and created an Office of Research and Technology Applications (ORTA).

From Workshop on petroleum and natural gas in the Kernforschungsanlage Juelich; Juelich, F.R. Germany (1 Jul 1986).

The workshop 'Petroleum and natural gas in the Kernforschungsanlage Juelich' was held at the Nuclear Research Centre Juelich on July, 1 and 2, 1986. It brought together about 60 experts from industry, government departments, universities and research

centres. This workshop entered into a discussion about recent work of the Nuclear Research Centre in various fields related to mineral oil and natural gas. Main topics of this workshop: long term availability of oil and gas, quantitative geology as an advanced method for exploration purposes of hydrocarbons, use of the high-temperature reactor in heavy oil recovery, new horizontally integrated energy systems as competitors to the vertical oil system, the energy alcohol R and D Program of the Nuclear Research Centre Juelich. The program consisted of 14 lectures. The present document presents short manuscripts of these lectures, as well as a list of the speakers and participants.

16160 **(ORNL/PPA—87/1) ORNL trends and balances, 1987-1992.** (Oak Ridge National Lab., TN (USA)). Jan 1987. Contract AC05-84OR21400. 50p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005282.

A brief overview is given that covers the roles, organization, R and D sponsors, and recent achievements of Oak Ridge National Laboratory. Current R and D programs are described in the areas of nuclear and engineering technologies, advanced energy systems, biomedical and environmental sciences, and basic physical sciences. ORNL's future activities are discussed. (LEW)

16161 (CONF-860203—, pp 401) **Measurements and status of a decommissioned experimental reactor - SEFOR.** West, L.; Ragland, C.; Welty, T. (Univ. of Arkansas, Fayetteville). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

The Southwest Experimental Fast Oxide Reactor (SEFOR) was decommissioned (by mothballing) in 1972 after two years of operation. Originally funded by the Southwest Atomic Energy Associates and the AEC, the Na-cooled reactor was operated by General Electric under contract. Although fuel was removed during decommissioning, a considerable amount of radioactive material (primarily Co-60 in activated steel) remains. Several years after decommissioning, ownership was transferred to the UA for long-term health physics monitoring and security. Recent GM counter surveys and smear analyses indicate no significant problems with old liquid and gaseous storage tanks. Residual Na is being examined for activation product inventory. Gamma spectroscopy of soil samples in 1984 raised concern of possible ground contamination in one area, prompting further gamma spectroscopy work. Results of surveys, smear analyses and gamma spectroscopy will be presented for the old reactor vessel, waste storage tanks, soil samples and sodium heat exchangers. SEFOR represents an unusual situation since the present owner (UA) assumed responsibility (at the request of the Arkansas State Health Department) after the facility was mothballed and after the original owner (SAEA) became defunct.

16162 **(DOE/DP/50053—T1) Sensitive nuclear activities in certain free world countries.** (USDOE Assistant Secretary for Defense Programs, Washington, DC. Office of International Security Affairs). 20 Dec 1986. Contract AC01-85DP50053. 39p. NTIS, PC A03/MF A01; GPO Dep. File Number DE87004140.

A concise, ready reference is provided for use in reviewing license applications for exporting to several countries for possible need of referral to DOE. For each country, nuclear explosive and sensitive nuclear activities, such as enrichment, reprocessing, heavy water production, and fabrication of fuel containing plutonium, are listed, as well as the organizations and installations responsible for such activities. Some activities are also included that are not sensitive but are closely related and could easily lead to sensitive activities. The countries covered are: Australia, Belgium, Canada, Denmark, Federal Republic of Germany, France, Greece, Iceland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, Turkey, and the United States.

16163 **Nuclear weapons testing fallout: proving causation for exposure injury.** Christoffel, T.; Swartzman, D. (Univ. of Illinois, Chicago). *American Journal of Public Health;* **76**: No. 3, 290-292(Mar 1986).

A recent Federal District Court opinion dealing with exposure of civilians to fallout from atomic bomb testing more than two decades ago provides guidance on how court action may in the future, address this problem. Close to 1200 negligence liability claims have been brought against the US government in the names of individuals who had resided near the Nevada Test Site and who subsequently developed cancer or leukemia. Because of the importance and complexity of the cases, the parties involved mutually agreed to the selection of 24 bellwether cases which then provided a legal and factural pattern against which other cases may be subsequently matched. The trial court's decision announced in Allen vs. United States, concluded that the government had a duty to adequately monitor, warn, and educate the population put at risk by the tests and that it had failed to fulfill its duty. However, it is only through case-by-case decision making, by courts reviewing all of the evidence in specific cases and tailoring results to best fit the specific facts, that equitable solutions can be applied in our optimal number of cases.

16164 **Informing the educators: one of the keys to public acceptance.** Mattox, G.C.; Reynolds, A.B.; Brenizer, J.S. *Transactions of the American Nuclear Society;* **53**: 62-63(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

One of the most difficult barriers to overcome in the task of gaining greater public acceptance of nuclear power is the widespread lack of correct information about the true risks and benefits of nuclear energy. The news media are the most prevalent sources of information for the public but they are highly constrained by the limits of space, time, and reader/viewer interest span in being able to cover this complex subject with any degree of completeness, much less with any degree of accuracy. Another source of information for the general public is the educational system, and while it also has its limitations, they are somewhat different from those faced by the media, and the educational system is generally considered to be a more credible information source than the media. This paper report on three programs undertaken in 1985 and 1986 by the Virginia Section of the American Nuclear Society (ANS) in conjunction with the University of Virginia (UVA), the Virginia State Department of Education, and various nuclear industry participants. Each program had its unique features, successes, an failures. All-in-all, these programs have been reported as being quite successful in helping to reach the public through informing the educators

Sozialvertraeglichkeit von Energieversorgungssystemen.

In Energy in focus. An intermediate balance of the energy debate.

The paper abstracted points out aspects of energy conservation in private households. Due to the still increasing housing space, the trend of full heating and the still increasing number of household appliances the private household sector is the only one to be expecting an increase of end use energy consumption. The paper discusses feasible ways of energy conservation in private households (e.g. type of housing facilities, type and shape of buildings, thermal insulation, energy conserving buildings).

16166 **(NP—7751299) Consumer energy conservation policies and programmes in Britain.** Gaskell, G.; Pike, R. (Wissenschaftszentrum Berlin (Germany, F.R.). Internationales Inst. fuer Umwelt und Gesellschaft). 1983. 176p. NTIS (US Sales Only), MF A01. File Number DE87751299.

This paper is a selective review of information from a variety of sources concerning consumer energy conservation in the residential sector. Although the technology for greater energy efficiency in this sector is readily available, it is now recognised that the major obstacles to progress are non-technical barriers. Ultimately it is consumers who determine whether energy is used efficiently or not. However, consumers' behaviour and actions are the product of a number of factors, including their personal characteristics, social structures, the nature of energy conservation programmes and the broader policy and regulatory system. Thus, in order to make general recommendations about the direction which future initiatives might take, we present an overview of the development and rationale of present policies, a description and evaluation of some existing and proposed energy conservation programmes and an analysis of the process of intentional social change.

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

Four years ago we were facing a future of ever-increasing energy prices and threats of oil cutoffs. There was a clear need to build new coal and nuclear power plants to replace those burning oil and gas, and there was broad agreement on the need for alternative sources of liquid fuels including oil from shales and coal. Now we are in the midst of an oil and gas "glut" with declining energy prices, mass cancellations of nuclear power plants and synthetic fuels projects, and a Synthetic Fuels Corporation that seems to be in deep trouble. What happened? Is it, as some politicians say, that the abundance of energy was inevitable once the business of energy was given back to the private sector? Or is it, as some conservationists claim, that our present energy situation is the direct result of improvements in energy efficiency? The fact is that neither position can be supported. Despite very high levels of exploration by private energy companies, the US reserves of oil and gas continue their slow, but steady, decline. On the other hand, technical improvements to energy efficiency have been less over the last few years than during normal times; the reason is that recession is accompanied by less than normal investment in new capital stock such as fuel-efficient automobiles, new homes, and more efficient factories.

Sozialvertraeglichkeit von Energieversorgungssystemen.

In Energy in focus. An intermediate balance of the energy debate.

The paper abstracted discusses world energy resources and reserves, the future availability of fossil fuels, conceivable trends of fossil fuel consumption and international coal, petroleum and natural gas reserves. Apart from these global aspects of fossil energy sources the paper deals with energy flow sheets and balances, the development and structure of primary energy consumption, the dependence on primary energy imports and the development of industrial emissions in the Federal Republic of Germany.

16170 **(Juel-Spez—352) World computer model of oil markets: OPEC pricing strategy model in the short and the long run.** Giesecke Sara-Lafosse, C.R. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Programmgruppe Systemforschung und Technologische Entwicklung). Mar 1986. 466p. NTIS (US Sales Only), PC A20/MF A01. File Number DE87751297.

The main objective of this thesis is to present, explain and demonstrate the three principles of energy economics. The first principle states that the marginal costs of all primary energy sources and energy products are uniquely interrelated to each other. This relation is built on technical transformation possibilities and consumer's substitution (product market competition). The second principle affirms the existence of a marginal source, whose price goes into the unidimensional energy system setting all other energy prices. At present, the model of the leading firm theory is the best approximation of actual market conditions. The price leader is Saudi Arabia and its crude oil is taken to be the marginal energy source. The model is scrutinized for stability and change. Important factors are the non-Saudi Arabian energy producers and the world oil demand price elasticity. The value of the world oil demand price elasticity is a multidimensional function of secondary energy price elasticities. Because this numerical value is important, an experiment with the model trying to fit (first order) these different product elasticities was done. The third principle asserts, that there exists a price for the marginal crude that minimizes the long term cost to the consumer and maximizes the long term wealth to the producer. The energy system elements are highly interactive, therefore the complex World Energy Model becomes necessary in selecting the best new energy alternative. To this end, natural gas transformed to methanol was chosen as a study case and the energy model expanded to test its advantages. The thesis ends with the results of this experiment and general conclusions.

2960 Electric Power

16171 **(CONF-8609236—1) Economic challenges facing rural electric cooperatives.** Costello, K.W.; Hemphill, R.C. (Argonne National Lab., IL (USA)). Aug 1986. Contract W-31109-ENG-38. 42p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005217.

From Georgia public utilities conference; Atlanta, GA, USA (10 Sep 1986).

This paper addresses some of the major rate-making issues and economic problems facing rural electric cooperatives (co-ops). These problems stem from the sharp rises in electricity rates that many co-ops are expected to experience over the next few years. These increases may lead to dramatic cutbacks in electricity usage by co-op members. Whether this will occur and will be severe enough to result in a "death spiral" effect is examined in this paper. Section II of this paper highlights the rate-making process of electric co-ops which are not subject to state regulation. This section outlines how rates are set, and focuses on the current rate structures of Illinois electric co-ops. Section III examines several eco-

nomic issues now confronting management of electric co-ops: Predicting revenue losses from higher rates based on the price elasticity of electricity usage; how usage "repression" from higher rates can be minimized by economically efficient rate designs; should marketing activities such as promotional pricing practices be adopted by co-ops to induce electricity sales in the short run; should co-ops subsidize energy conservation investments by members; and is a "death spiral" likely to occur.

16172 **(DOE/EIA—0226(86/10)) Electric power monthly, October 1986.** (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). 13 Jan 1987. 50p. NTIS, PC A03/MF A01 - GPO; 1; GPO Dep. File Number DE87004812.

In October 1986, nuclear-powered generation represented a record share, 18.3%, of the total electricity produced during the month. Nuclear net generation during October 1986 increased 16% over the October 1985 level to 36,214 gigawatthours, one of the highest levels ever reported for a single month. Petroleum net generation increased 31% in October 1986 over October 1985 generation to 9868 gigawatthours. The average price of petroleum was $13.59 per barrel.

16173 **(DOE/OR/21400—T286) Determining the extent, benefits, cost, and timing of utility conservation and load management programs.** Hirst, E. (Oak Ridge National Lab., TN (USA)). Jan 1987. Contract AC05-84OR21400. 21p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005597.

Purpose of this paper is to discuss ways that an electric utility can determine the extent of the energy-conservation resource in its service territory, and how much of that resource can be realized at what cost and over what time period. It also briefly discusses regulatory practices that can promote or inhibit utility demand-side programs.

16174 **(EPRI-EL—5003-Vol.1) Load modeling for power flow and transient stability computer studies: Volume 1, Summary report: Final report.** Price, W.W.; Wirgau, K.A.; Murdoch, A.; Nozari, F. (General Electric Co., Schenectady, NY (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. 116p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920237.

By transforming utility load-mix data for use in standard load flow and transient stability programs the LOADSYN software makes it easy for power system analysts to produce new, more-accurate load models for system simulations. Better models can better predict power system behavior and thus improvements in transmission system utilization and planning.

16175 **(NP—7750863) Annual report of the electric power industry of the Federal Republic of Germany 1985. (Summary of the quarterly reports). Power generation in publicly-owned electric utilities, the industrial independent units and the Federal Railways and overall the electric power consumption in the Federal Republic of Germany.** (Bundesministerium fuer Wirtschaft, Bonn (Germany, F.R.)). 1986. 12p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750863.

For the year under report, figures are given on: Origins and consumption of electric power; power generation in public utilities; industrial plants and the Federal Railways; development of power consumption in the network of public utilities in the Federal States; net power generation and consumption in industry and development of the gross power generation in public power plants and industrial unnt in the Federal States.

16176 **Winning the rate base battle.** Steigelmann, W.H. *Transactions of the American Nuclear Society;* **53**: 366-367(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In most states, all costs associated with building new power plants and other facilities are born by the owning utility until the facility becomes useful to customers. For a nuclear plant, this means that a utility must raise several billion dollars in capital over a period of 10 to 20 years, often undergrowing pressures to cancel the project. None of the possible ways of mitigating rate shock is free of controversy, but the objective should be to do that which is most equitable and has least adverse effects. The basic options are discussed, and all but one involves phasing in over time the full economic effects of the new plant. The impacts on average electricity price of three of the seven approaches are illustrated.

16177 **Electric utility regulation - today and tomorrow.** Seligson, C.H. *Transactions of the American Nuclear Society;* **53**: 367(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Currently and for the last few years, numerous rate regulatory commissions and electric utilities have initiated investigations and proposals designed to mitigate the rate increases required as new nuclear generating facilities become operative. The so-called rate phase-in generally involves gradual rather than one-time rate increases to avoid rate shock to consumers. Additionally, some state regulatory commissions have eliminated from current rates the effects of new generating capacity which they have determined is unnecessary to meet the present load requirements of a given utility. State regulators have also determined that significant portions of the amounts spent on nuclear generating units over a period of years were imprudently directed, resulting in a disallowance from the rate base cost of the unit. The result of phase-in plans and disallowances has been not only smaller rate increases for consumers but also a measurable financial loss for the utility owners. Such losses have encouraged a distinct shift in future power planning methodologies to avoid long lead time, high capital cost generation for the future, resulting in a denial of the significance of the nuclear option. These new methodologies may well result in future shortages of adequate base-load capacity and a long standing utility concept of an obligation to serve.

16178 **Can nuclear power survive rate-of-return regulation?.** Dittmar, L.A. *Transactions of the American Nuclear Society;* **53**: 367-368(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Most commercial nuclear plants in the US, both under construction and in operation, are subject to rate-of-return regulation. Utilities that own nuclear plants cannot reasonably expect to recover all of the costs, including a fair return on investment, of constructing, operating, maintaining, and decommissioning their plants - at least not under regulation as it currently exists. The future of nuclear power in this country will in large part be determined by the financial and organizational restructuring of the electric utility industry that is certain to occur. This inevitable restructuring is likely to be accompanied by modifications to and realignment of the financial regulation of the electric utility industry. But such changes will not bode well for energy options that cannot meet the ultimate market test.

16179 **Planning for rate base treatment of large power plants.** Faruki, C.J. *Transactions of the American Nuclear Society;* **53**: 368(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper addresses two related areas of planning for inclusion in rate base of large generating stations. First, the paper discusses the range of options available as to how the plant is to go into rate base, e.g., phase-in plans. In this connection the process of generating the entire range of options that may be available is described and examined. Second, the paper examines innovative ways of using procedures (e.g., accounting proceedings, settlement procedures, cost caps, and other ideas short of a full-blown rate case) and the resources available in the ratemaking arena, to obtain, in the least painful way possible, the necessary ratemaking orders. The thesis is that there must be better alternatives to the many proceedings that have either begun as, or seem to be leading to, endless retrospective examinations of multiple questions (from load forecasting to construction management to continuation-of-construction decisions) under the label of prudence inquiries.

16180 **Concept of prudence and its impact.** Crowley, J.H.; Kaminski, R.S. *Transactions of the American Nuclear Society;* 53: 370-371(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The technical and financial regulation of the US nuclear electric industry is divided between the federal and state governments. The federal government oversees the environmental and safety aspects of the technology and is essentially unconcerned with costs. The state utility commissions address cost and are essentially unconcerned with the benefits which the safety and environmental enhancements add to the quality of life. Increasingly, the state utility commissions are relying on the concept of prudence to justify major cost disallowances for light water reactors (LWRs) entering the rate base. This situation, if it continues, will cause profound changes in the electric utility industry conducts its business. The authors believe these changes may not be in the long-term interest of both the ratepayers and the investors.

2980 Consumption And Utilization

REFER ALSO TO CITATION(S) 16210, 16211, 16212, 16213, 16214

16181 **(EPRI-EM—4882-CCM) REEPS [Residual End-Use Energy Planning] code: User's guide.** (Cambridge Systematics, Inc., Berkeley, CA (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Jan 1987. 280p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920241.

Newly revised on the basis of users' experience, the REEPS (Residential End-Use Energy Planning System) code is an integrated end-use econometric model of residential energy-use patterns for long-term forecasting and demand-side analysis. The user's guide, which describes the logic and structure of the model, also shows how to prepare input files to execute the program.

16182 **(EPRI-EM—4988-Vol.1) Industrial end-use planning methodology (INDEPTH): Demonstration of design: Volume 1, Econometric forecasting models: Interim report.** Andrews, L.M.; King, M.J.; Leary, N.; Perry, D.M.; Snow, C.C. (Battelle Columbus Labs., OH (USA); Synergic Resources Corp., Seattle, WA (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Dec 1986. 238p. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920211.

The INDEPTH industrial planning methodology will enable utilities to forecast service area electricity demand. The system allows the user to develop energy forecasts for the whole industrial sector, to examine industries most important to the service area, and to study uses of electricity that are of interest in demand-side management programs. The econometric model in this volume forecasts energy use for the entire industrial sector using a set of simultaneous factor demand equations with an imposed structure derived from the economic theory of cost-minimizing behavior.

2990 Unconventional Sources And Power Generation

Sozialvertraeglichkeit von Energieversorgungssystemen.

In Energy in focus. An intermediate balance of the energy debate.

The large potential of renewable energy sources would theoretically suffice to cover the energy demand of the Federal Republic of Germany. The paper abstracted gives a detailed description of solar energy conversion along with the systems required to relieve the energy market (solar collectors, solar plants, solar cells, modules, heat pumps, wind turbines, biomass conversion plants).

30 DIRECT ENERGY CONVERSION

3001 Mhd Generators

16184 **(BARC—1245) Electrode boundary layer and its influence on the power output characteristics in open-cycle Faraday MHD generators.** (Bhabha Atomic Research Centre, Bombay (India)). 1984. 32p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701245.

The boundary layers present over the electrode surface in open-cycle Faraday MHD generators have been suitably considered and their effects on the generator power output have been studied. The electrode voltage drop, an important electrical loss caused by the electrode boundary layer giving rise to plasma non-uniformities inside the MHD channel, has been accounted for in the derivation of power density expression. The finite electrode segmentation in a real Faraday MHD generator has also been considered through its effect of reducing both the electical conductivity and the Hall parameter. Following a simplified approach, the expressions for the voltage drops across the gasdynamic layer, electrical sheath and slag layer have been derived to estimate the electrode voltage drop in a finitely segmented Faraday MHD generator with and without ash in the combustion products. The computed results of electrode voltage drop and power density have been discussed. The presence of slag layer over the electrode surface is found to reduce the electrode voltage drop considerably. It is argued that the finite segmentation of electrodes and the electrode voltage drop, modifying the power output significantly, should be properly taken into account while analysing the performance of a real Faraday MHD generator. 25 refs., 6 figures.

16185 **(BARC—1291) Liquid Metal MHD Generator Systems.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 81p. NTIS (US Sales Only), PC A05/MF A01. File Number DE87701257.

Liquid Metal MHD (LMMHD) Generator Systems are becoming increasingly important in space and terrestrial applications due to their compactness and versatility. This report gives the current status and economic viability of LMMHD generators coupled to solar collectors, fast breeder reactors, low grade heat sources and conventional high grade heat sources. The various thermodynamic cycles in the temperatures range of 100degC-2000degC have been examined. The report also discusses the present understanding of various loss mechanisms inherent in LMMHD systems and the techniques for overcoming these losses. A small mercury-air LMMHD experimental facility being set up in Plasma Physics Division along with proposals for future development of this new technology is also presented in this report. 49 refs.

16186 **(DOE/ET/15601—8) Testing and evaluation of heat recovery/seed recovery: Annual technical progress report, april 1981-March 1982.** (Mississippi State Univ., Mississippi State (USA). MHD Energy Center). Apr 1982. Contract AC02-80ET15601. 150p. Minerals Management Service, 18th and C Streets, NW, Washington, DC 20240. File Number DE87005005.

Mississippi State University has constructed a test stand that can simulate the gas-slag-seed stream composition, temperature, and metal/fireside environmental conditions for the radiant furnace, superheater, and other HRSR components of a coal-fired base-line MHD power plant. The test stand is being used to study the effects of combustion stoichiometry and secondary combustion on NO/sub x/ generation, heat transfer, and gas stream properties. Microprocessor-controlled diagnostic instruments are being evaluated by using them on the test stand to measure temperatures and characterize the gas-slag-seed stream. The facility will also be used to obtain corrosion-erosion data on off-the-shelf commercial materials, to evaluate gas stream and heat transfer models, and to perform, as directed by DOE, any tests necessary to supply data for the national MHD research effort and especially the HRSR program.

16187 **(N—87-11837) Space-based laser-driven MHD generator: feasibility study. Final report.** Choi, S.H. (Information and Control Systems, Inc., Hampton, VA (USA)). Oct 1986. 52p. (NASA-CR—178184; NAS—1.26:178184; REPT—681104). NTIS, PC A04/MF A01.

The feasibility of a laser-driven MHD generator, as a candidate receiver for a space-based laser power transmission system, was investigated. On the basis of reasonable parameters obtained in the literature, a model of the laser-driven MHD generator was developed with the assumptions of a steady, turbulent, two-dimensional flow. These assumptions were based on the continuous and steady generation of plasmas by the exposure of the continuous wave laser beam thus inducing a steady back pressure that enables the medium to flow steadily. The model considered here took the turbulent nature of plasmas into account in the two-dimensional geometry of the generator. For these conditions with the plasma parameters defining the thermal conductivity, viscosity, electrical conductivity for the plasma flow, a generator efficiency of 53.3% was calculated. If turbulent effects and nonequilibrium ionization are taken into account, the efficiency is 43.2%. The study shows that the laser-driven MHD system has potential as a laser power receiver for space applications because of its high energy conversion efficiency, high energy density and relatively simple mechanism as compared to other energy conversion cycles.

3005 Fuel Cells

16188 **(CONF-861008—2) Design and economics of large fuel cell power plants.** Minkov, V.; Daniels, E.; Dennis, C.; Krumpelt, M. (Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 9p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004823.

From Fuel cell seminar; Tucson, AZ, USA (26 Oct 1986).

This paper discusses two new system designs for phosphoric acid and molten carbonate fuel cells. Both designs were developed cascading the flow of energy through the fuel cells, combustion turbine and steam turbine. By varying the utilization of fuel in the fuel cells and the current density, the distribution of power among the prime movers is being changed, and effects of those changes analyzed. The general approach for evaluating and developing cost-effective fuel-cell systems is to optimize them for minimum cost of electricity (COE) through integrated thermodynamic simulation and cost analysis using the SALT code.

16189 **(CONF-861008—3) Progress on molten carbonate fuel cell alternative cathodes.** Smith, J.L.; Kucera, G.H.; Minh, N.Q. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004862.

From Fuel cell seminar; Tucson, AZ, USA (26 Oct 1986).

Li_2MnO_3 and $LiFeO_2$ have been developed to the point that they should perform well in a cell. The cathode microstructure is of critical importance in obtaining good performance with these materials whose resistances are higher than NiO. Several methods have been developed to provide the dual porosity materials for fabrication of the required cathode structure for cell testing.

16190 **(CONF-861008—4) Electronic defects in $LiFeO_2$.** Smith, J.L.; Kucera, G.H.; Minh, N.Q.; Moreschi, J.R. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004863.

From Fuel cell seminar; Tucson, AZ, USA (26 Oct 1986).

The studies on undoped $LiFeO_2$ to date have provided an understanding of the conduction mechanisms and of the effect of reaction environment on the stoichiometry of the material. The semiconductor type and its region of influence as well as the degree of cation nonstoichiometry have been assessed while that of oxygen nonstoichiometry is under way. It should be possible to obtain the defect equilibrium constants from the p_{O_2} thermogravimetric measurements and accordingly the ΔH and ΔS of the defect reaction.

16191 **(CONF-861008—5) Characterization of monolithic fuel cell components.** Dees, D.W.; Mrazek, F.C. (Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004929.

From Fuel cell seminar; Tucson, AZ, USA (26 Oct 1986).

Electrochemical characterization of materials and components is an important part of the monolithic fuel cell development effort. The bulk electrical/ionic conductivity of all cell materials has been determined over the range of temperatures (800 to 1000°C) and oxygen pressures (0.2 to 10^{-18} atm). A series of ac impedance studies has been performed on various three-layer (anode/electrolyte/cathode) composite samples. A complex impedance diagram for one of the composites is given. While current densities up to 2.2 A/cm² have been observed, further increases are possible through reduced interfacial resistances.

16192 **(CONF-8609230—1) High-temperature fuel cells.** Pierce, R.D. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004870.

From Electrochemical sciences conference; Cleveland, OH, USA (14 Sep 1986).

The DOE is about to embark on the development and demonstration of a prototype MCFC stack of 0.1 to 0.5 MW. This engineering effort will be complemented by base technology and component development contracts sponsored by DOE and EPRI. The tubular SOFC concept under development by Westinghouse is being tested in multikilowatt generators. Cell endurance and cost are the major issues for both concepts. ANL is developing the monolithic SOFC concept with laboratory-scale cell arrays. Continued development of advanced ceramic fabrication technology is the major thrust of that program.

16193 **(DOE/MC/12841—2254) Interaction of trace species with the molten carbonate fuel cell: Task report No. 12.** Bloomfield, D.; Gelb, A.; Guberman, S.; Lewis, P. (Physical Sciences, Inc., Woburn, MA (USA)). Nov 1979. Contract AT21-79MC12841. 61p. (TR—192). NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87005021.

The concept of a molten carbonate fuel cell/coal gasifier power plant is under development at the present time. Since a large number of trace species will be found in the coal gasifier effluent and further, since the effect of these trace species on molten carbonate fuel cells is not known, an estimate of this effect is required. The motivation for the study is further enhanced by the fact that the cell surface area is quite large, about 3.5×10^6 ft² in the case of the ECAS II molten carbonate fuel cell. Hence, any trace species entering the cell will have ample opportunity to react with the electrodes or the electrolyte. It is relatively simple to show (neglecting solubility effects) that if a trace species strongly adsorbs on an electrode then at a concentration of only 1 ppM, the total pore area of the electrode (about 40 sq miles in the ECAS II power plant) would be covered to 50% in about a day.

16194 **Computer-based phosphoric acid fuel cell analytical tools - Descriptions and usages.** Lu, C.; Presler, A.F. (NASA Lewis Research Center, Cleveland, OH 44135). pp 165-167 of Progress in batteries and solar cells. Cleveland, OH; JEC Press Inc. (1987).

Under DOE support, NASA Lewis Research Center (LeRC)/Cleveland State University (CSU) have developed simulation models which predict the phosphoric acid fuel cell (PAFC) power plant system performance under steady and transient states, and design the configuration of components and the synthesis of systems optimally. Two computer models are developed: an engineering model and a system model. The engineering, or "multi-staged," model which is solved by the finite difference method, determines the balances and properties at different sections. A mainframe computer (e.g., IBM 370/3033) is needed to solve this model. The system, or "single-staged," model uses the thermodynamic balances to set up algebraic equations and calculates the physical and chemical properties of the streams for one operating condition, such as the mean temperature and pressure. The personal computer spreadsheet program, Lotus 1-2-3, is used to develop the system

model. Spreadsheet-created process simulation offers a convenient, flexible means of modeling chemical processes and comparing their yields and costs. The authors have developed four areas of application for these models. For the engineering model: 1. To simulate the performance of the designed system in the steady and transient states (i.e., load changing period). 2. To optimize the component configurations and operating conditions.

16195 **Catalyst and electrode research for phosphoric acid fuel cells.** Antoine, A.C.; King, R.B. (NASA Lewis Research Center, Cleveland, OH 44135). pp 168 of Progress in batteries and solar cells. Cleveland, OH; JEC Press Inc. (1987).

The US Department of Energy (DOE) is funding phosphoric acid fuel cell commercialization programs at Westinghouse, Engelhard, and UTC. In support of these commercialization efforts, DOE Morgantown Energy & Technology Center, Morgantown, WV, is also funding research under an advanced research and technology development (AR & TD) program. These programs are managed by NASA Lewis Research Center, Cleveland, OH, and include, in addition to catalyst and electrode research, carbon component technology development at Great Lakes Research Corp. and fuel cell modelling and analysis support work at Cleveland State University. The major purpose of the AR & TD program is to conduct research on fuel cell catalysts and electrodes, the results of which will provide major improvements in electrode performance and life, and also will aid in reducing fuel cell costs.

16196 **Investigation of alternative MCFC cathode materials at Argonne National Laboratory.** Pierce, R.D.; Smith, J.L.; Kucera, G.H. (Argonne National Lab., 9700 South Cass Avenue, Argonne, IL 60439). pp 159-164 of Progress in batteries and solar cells. Cleveland, OH; JEC Press Inc. (1987). Contract W-31-109-ENG-38.

The conventional cathode material for a molten carbonate fuel cell (MCFC) is NiO. However, these cathodes have limited longevity due to dissolution at cathode conditions and precipitation as metal at anode conditions. Alternative cathode materials are being sought through a process of identifying stable materials in the cathode environment, evaluating their properties, and modifying their conductivity through doping. The work has centered on LiFeO/sub 2/ and Li/sub 2/MnO/sub 3/ which are stable, have low solubility, and do not migrate under cell conditions. LiFeO/sub 2/ can be produced with resistivity in the range of 10-40 ohm-cm at 650°C in realistic cathode gases.

16197 **Materials for high-temperature fuel cells.** Ackerman, J.P.; Claar, T.D. (Argonne National Lab., Argonne, IL 60439). pp 137-143 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—).

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

High-temperature fuel cells offer numerous opportunities for implementation of advanced materials and processing technologies. The functional requirements of cell materials and components have been reviewed and the potential applicability of several emerging fields of materials research and development relevant to fuel cells have been discussed. Continued interaction between fuel cell technologists and materials researchers in the future offers exciting possibilities for the development of fuel cells with improved capabilities.

32 ENERGY CONSERVATION, CONSUMPTION, AND UTILIZATION

16198 **Long-term energy projections and novel energy systems.** Rogner, H.H. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

Energy demand and supply projections are bound inextricably with external realities. Consequently, they reflect the dominant views on the development of those factors that primarily determine energy consumption. Some of these factors are highly uncertain or so difficult to quantify that it is impossible to model their effects. Other factors, such as economic activity or population development, can serve as variables that, to a large extent, determine energy consumption. Hence, parallel to the prospect of global economic activity slowly shifting from exponential growth (until the 1970s considered the norm) to a prolonged period of low growth, there have been similar downward revisions in the corresponding energy consumption. But, there are other reasons for the recent downward revisions of energy projections. In contrast to energy forecasters of the 1970s, today's analyst can base their projections on empirical evidence about the response of industries and households to two unprecedented oil price increases of the last decade. Adjustments to the realities of high energy costs have resulted in energy efficiency improvements along the entire energy chain from resource extraction to consumption, as well as interfuel substitution, structural economic changes, and changes in individual attitudes.

16199 **(BRE-IP—14/86) Gas engine driven heat pump dehumidification system at the Farnborough Recreation Centre.** McCall, M.J. (Building Research Establishment, Watford (UK)). Nov 1986. 4p. Publications Sales Office, Building Research Establishment, Garston, Watford WD2 7JR.

A 12 month monitoring period has demonstrated that the performance of a gas engine driven dehumidification system for an indoor swimming pool at the Farnborough Recreation Centre has exceeded design expectations and achieved a 70% saving in heating energy. Assessment of the installation's operation has revealed that future gas engine heat pump systems could provide even greater savings by use of fresh air ventilation.

16200 **(CONF-861204—4) Measurements of pressure drop in turbulent pipe flows of highly loaded HDPE slurries.** Choi, U.S.; Kasza, K.E. (Argonne National Lab., IL (USA)). Nov 1986. Contract W-31109-ENG-38. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004833.

From 4. Miami international symposium on multi-phase transport and particulate phenomena; Miami Beach, FL, USA (15 Dec 1986).

Argonne National Laboratory, under sponsorship of the US Department of Energy, is developing advanced energy transmission fluids for improving thermal system performance. The efforts are based on two concepts: (1) utilization of very low concentrations (20 to 200 wppM) of non-Newtonian additives to the appropriate carrier liquid to reduce frictional flow losses by 30 to 80%; and (2) utilization of a pumpable phase change slurry comprised of particulates of a high heat of fusion material conveyed by a liquid to enhance both bulk convective energy transport and heat transfer coefficients at heat exchanger surfaces. One example of candidate particles is cross-linked form-stable high density polyethylene (X-HDPE).

16201 **(DOE/CE/10156—1) ICP [Institutional Conservation Program] monitoring: Final report.** (Arawak Consulting Corp., New York (USA)). Sep 1986. Contract AC02-83CH10156. 70p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87004910.

The following pages present the Final Report of activities undertaken by Arawak in carrying out its contractual obligations for the New York Support Office of US Department of Energy. The contract calls for the field monitoring/review of DOE grants to schools and hospitals under the Institutional Conservation Program (ICP). This Final Report is the result of a review of statistics and findings gathered over the period of the contract, which included monitoring visits to 78 grantees in New York State and New Jersey. The report is intended to highlight aspects of the monitoring project and to make recommendations.

16202 (Juel-Spez—291, pp 115-129) **Heating systems.** Schulz, W.; Rodenhaeuser, F. (Bochum Univ., Germany, F.R. Lehrstuhl fuer Energieanlagentechnik; Kloeckner-Humboldt-Deutz A.G., Koeln, Germany, F.R.). Jan 1985. (In German). NTIS (US Sales Only), PC A11/MF A01. File Number DE87751334.

Sozialvertraeglichkeit von Energieversorgungssystemen.

In Energy in focus. An intermediate balance of the energy debate.

Energy consumption due to space heating is of particular interest. Apart from private households it also includes industry and the small consumers. The heat market absorbs almost 3/4 of end use energy demands. There is a particular demand for space heating. Private household energy consumption is classified by energy sources and heating systems. Space heating is making use of heating oils, natural gas, coal, electric power and district heat. Heating systems may consist in furnaces, central heating systems, district heating systems or heat pumps and solar systems. The development of heating structures is classified by energy sources and individual or central heating systems.

16203 **(LBL—21862) Ventilation and occupant behavior in two apartment buildings.** Diamond, R.C.; Modera, M.P.; Feustel, H.E. (Lawrence Berkeley Lab., CA (USA)). Oct 1986. Contract AC03-76SF00098. 23p. (CONF-8609226—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003550.

From 7. Air Infiltration Centre conference, occupant interaction with ventilation systems; Stratford-upon-Avon, UK (29 Sep 1986).

In this paper we approach the subject of ventilation and occupant behavior in multifamily buildings by asking three questions: (1) why and how do occupants interact with ventilation in an apartment building, (2) how does the physical environment (i.e., building characteristics and climate) affect the ventilation in an apartment, and (3) what methods can be used to answer the first two questions. To investigate these and related questions, two apartment buildings in Chicago were monitored during the 1985-1986 heating season. In addition to collecting data on energy consumption, outdoor temperature, wind speed, and indoor apartment temperatures, we conducted diagnostic measurements and occupant surveys in both buildings. The diagnostic tests measured leakage areas of the individual apartments, both through the exterior envelope and to other apartments. The measured leakage areas are used in conjunction with a multizone air flow model to simulate infiltration and internal air flows under different weather conditions. The occupants were questioned about their attitudes and behavior regarding the comfort, air quality, ventilation, and energy use of their apartments. This paper describes each of the research methods utilized, the results of these efforts, and conclusions that can be drawn about ventilation-occupant interactions in these apartment buildings. We found that there was minimal window opening during the winter, widespread use of auxiliary heating to control thermal comfort, and that the simulations show little outside air entry in the top-floor apartments during periods of low wind speeds. The major conclusion of this work is that a multi-disciplinary approach is required to understand or predict occupant-ventilation interactions. Such an approach must take into account the physical characteristics of the building and the climate, as well as the preferences and available options of the occupants.

16204 **(NP—7770052) Selection of working fluids for absorption heat pumps.** Niesemeyer, N. (Technische Univ. Braunschweig (Germany, F.R.). Fakultaet fuer Maschinenbau und Elektrotechnik). 24 May 1985. 127p. (In German). NTIS (US Sales Only), PC A07/MF A01. File Number DE87770052.

The general acceptance of the absorption heat pump has been hampered so far by the fact that only ammonia/water and water/lithium bromide were used as working fluids. Systematic research into suitable pairs of working fluids has become possible with new techniques for analyzing the thermodynamics of mixtures. Requirements on refrigerants, absorption agents and mixtures are listed. Information is presented on how to select suitable working fluids and on the principle of correspondence for calculating the absorption process. The method of calculation is applied to ammonia/water, methylamine/water, halogenated refrigerants, saturated hydrocarbons (propane to tetradecane), and salt solutions. (HWJ).

16205 **(ORNL/TM—10264/V1) Occupant evaluation of commercial office lighting: Volume 1, Methodology and bibliography.** Brown, M.A. (ed.). (Oak Ridge National Lab., TN (USA); American Inst. of Architects, Washington, DC). Nov 1986. Contract AC05-84OR21400. 86p. NTIS, PC A05/MF A01. File Number DE87005291.

This report documents the forms and procedures developed for a post-occupancy evaluation of office lighting environments. It is the first in a series of four reports. The central aim of the larger project is to explore possible causal factors that are associated with successful lighting design, with particular interest in the relationship between the connected lighting power load and subjective measures of lighting quality. A post-occupancy evaluation procedure was used as the strategy for obtaining the desired data. The procedure involved collecting several different types of data: (1) direct measures of the physical environment, including spatial luminances, illuminances and contrast conditions; (2) indirect measures such as the amount of space provided for each work station and the connected lighting power load; (3) occupant responses to lighting and other factors of the work station; and (4) a limited number of expert ratings of the lighting conditions. Data from thirteen buildings and 1217 work stations were collected. These data were built into a database allowing lighting quality to be quantified and explained.

16206 **(PB—87-108759/XAB) Development of advanced water-to-water heat pumps in the range of 200- to 5000-kW thermal output: prestudy.** Gilli, P.V. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 172p. (D—17:1986). NTIS, PC PC E07/MF E01.

The feasibility study identified a program of work with the aim of developing heat pumps with a seasonal-performance factor around 4 when working from a heat-storage source of a temperature between 10 and 20 C.

16207 **Determination of household energy using 'fingerprints' from energy billing data.** Hirst, E.; Goeltz, R.; White, D. (Oak Ridge National Lab., TN, USA). *International Journal of Energy Research;* **10**: No. 4, 393-405(Oct-Dec 1986).

Electric and gas utilities (in the U.S.A.) bill their customers on a regular basis. These data provide a truly valuable information resource for energy conservation programme analysts and evaluators. This paper discusses ways to analyse such billing data. The Princeton University score-keeping model, which permits decomposition of total household energy use into its weather- and non-weather-sensitive elements is used. The score-keeping model also allows one to compute weather-adjusted energy consumption for each household based on its billing data and model parameters; this is the model's estimate of annual consumption under long-run weather conditions. The methods discussed here extend the score-keeping results to identify additional characteristics of household energy use. The methods classify households in terms of the intensity with which the particular fuel is used for space heating. In addition, households that use the particular fuel for air conditioning are identified. In essence, the billing data and model results define household energy use 'fingerprints'.

3202 Transportation

REFER ALSO TO CITATION(S) 16229, 16230, 16231, 16232

16208 **(ESC-WR—86-16) Calculation of emission scenarios for passenger cars in the Netherlands.** Kroon, P.; Scheele, D. (Stichting Energieonderzoek Centrum Nederland, Petten. Energie Studie Centrum). Aug 1986. 16p. (In Dutch). Energie Studie Centrum ECN, P.O. Box 1, 1755 ZG Petten, Netherlands.

The Energy Study Centre of the Netherlands Energy Research Foundation ECN has developed recently an energy model which has been used for calculating emissions from passenger cars for the years 1985, 1990, 1995 and 2000. Emission components are:

sulfur dioxide, nitrogen oxides, hydrocarbons (C/sub x/H/sub y/), carbon monoxide, aldehydes, particulates and lead. The linear programming energy model optimizes costs and is described extensively in report ESC-35 which will be published soon. Nine scenario calculations have been conducted with assumed growth of the fleet of cars with 20%, 30%, 40% and 50%, and increasing mileage per year per car: 0%, 0.9%, 1.8% and 2.5%, respectively; both assumptions for the period 1983-2000. Results are presented. The study was sponsored by the Dutch Ministry of Economic Affairs. 9 tabs., 2 refs.

16209 **(ORAU/IEA—86-2(M)) Roles for electricity in transportation.** Burwell, C.C. (Oak Ridge Associated Universities, Inc., TN (USA)). Apr 1986. Contract AC05-76OR00033. 46p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004874.

Electricity plays a more important role in the provision of transportation services than is popularly thought, since electricity is used for such transportation services as pumping water. There are also many ways electricity, electric technology, and electric products make some transportation services unnecessary by decentralizing production, concentrating materials before shipment, reducing weight of transportation equipment and containers, and eliminating the transporting of fuel. This report briefly summarizes the historic and contemporary contributions of electricity in providing transportation services directly and indirectly and identifies expanded roles for electricity should they be needed or be preferred in the future.

16210 **(PB—87-112074/XAB) National urban mass transportation statistics. 1983 Section 15 annual report. Transit financial and operating data reported for years ending between January 1, 1983 and December 31, 1983.** Lyons, W.M. (Department of Transportation, Cambridge, MA (USA). Transportation Systems Center). Dec 1984. 628p. (DOT-TSC-UMTA—84-37). NTIS, PC A99/MF A01.

The report summarizes the financial and operating data submitted annually to the Urban Mass Transportation Administration by the nation's public-transit operators. It contains aggregate industry statistics and detailed financial and operating data on the individual transit systems.

16211 **(PB—87-112082/XAB) National urban mass transportation statistics. 1981 Section 15 report. Transit financial and operating data reported for fiscal year ending between July 1, 1980 and June 30, 1981. Annual report.** Jacobs, M. (Department of Transportation, Cambridge, MA (USA). Transportation Systems Center). May 1983. 367p. (DOT-TSC-UMTA—82-47). NTIS, PC A16/MF A01.

The report summarizes the financial and operating data submitted annually to the Urban Mass Transportation Administration by the nation's public-transit operators. It contains industry aggregate statistics and detailed financial and operating data on individual transit agencies.

16212 **(PB—87-112090/XAB) National urban mass transportation statistics. 1981 Section 15 report. 16216 (CONF-8503273—Summ., pp 11, Paper 1) **Short-distance heat supply - introduction.** Hein, K. 1985. (In German). NTIS (US Sales Only), MF A01. File Number DE87751305.

From ISH '85: symposium on short-distance heat within the international trade fair sanitation-heating-air conditioning; Frankfurt am Main, F.R. Germany (22 Mar 1985).

This article centers on deliberations relating to the chances and possibilities of decentralized dual-purpose-power-plants in contrast to the classical big power plants. In detail, the article deals with the fundamentals, short-distance heat supply, energy converters, fuel consumption, energy transport, and the real degree of efficiency. (HAG).

16217 **(DOE/OR/00033—T259) The role of electricity in glass making.** Burwell, C.C. (Oak Ridge Associated Universities, Inc., TN (USA)). Dec 1985. Contract AC05-76OR00033. 16p. NTIS, PC A02/MF A01. File Number DE87004885.

The electric route to glassmaking offers substantial environmental and cost benefits and a means to substitute US sources of coal and uranium for declining reserves of oil and gas. The use of electricity as a source of heat in glassmaking is competitive in cost of capital for expansion of production and in terms of energy costs, especially following deregulation of the price of natural gas. Between 1962 and 1980 the amount of total energy used per unit of glass product declined by 23% while the use of electricity (per unit of product) increased by 60%. The energy saved in using electricity for glass melting is equal to or greater than the energy needed to produce the electricity. Other benefits of electric heat include improved working conditions and improved efficiency.

16218 **(DOE/OR/00033—T263) Electricity and the pulp and paper industry.** Burwell, C.C. (Oak Ridge Associated Universities, Inc., TN (USA)). May 1985. Contract AC05-76OR00033. 27p. NTIS, PC A03/MF A01; GPO Dep. File Number DE87004891.

The production of pulp and paper is one of North America's largest industrial activities. Paper and paperboard consumption averages almost one ton a year for each household. Many of the evolutionary changes occurring in the pulp and paper industry are based on electric technology and thus require increasing amounts of electricity. In response to the need to conserve natural resources, to minimize environmental impacts, and to control escalating energy costs, the pulp and paper industry is undergoing significant changes. On the other hand, self-generation of electricity by the pulp and paper industry has not increased since the mid-1970s despite both the prior history of increases and the increasing use of wood-derived fuels.

16219 **(DOE/OR/00033—T268) Roles of electricity: Pulp and papermaking.** Burwell, C.C.; Mills, M. (ed.); McCarthy, D. (ed.). (Oak Ridge Associated Universities, Inc., TN (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Sep 1986. Contract AC05-76OR00033. 21p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004886.

The report begins with a brief description of the industry. The pulp and paper business, while seemingly homogeneous, is enormously variable in detail. In this brief analysis, the reader is provided with an overview of the subject - a view of the forest, so to speak, not of the trees - sufficient to grasp the forces causing change in the industry. It will be seen that these changes, in general, are dictating an increasing dependence on electricity. The focus of this analysis has been to shed light on the increasing role for electricity in the age-old process of papermaking.

16220 **(DOE/OR/00033—T269) Roles of electricity: Electric steelmaking.** Burwell, C.C. (Oak Ridge Associated Universities, Inc., TN (USA); Electric Power Research Inst., Palo Alto, CA (USA)). Jul 1986. Contract AC05-76OR00033. 19p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004888.

Electric steel production from scrap metal continues to grow both in total quantity and in market share. The economics of electric-steel production in general, and of electric minimills in particular, seem clearly established. The trend towards electric steelmaking provides significant economic and competitive advantages for producers and important overall economic, environmental, and energy advantages for the United States at large. Conversion to electric steelmaking offers up to a 4-to-1 advantage in terms of the overall energy used to produce a ton of steel, and s similar savings in energy cost for the producer. The amount of old scrap used to produce a ton of steel has doubled since 1967 because of the use of electric furnaces.

16221 **(PB—87-111738/XAB) Waste/soil treatability studies for four complex industrial wastes: methodologies and results. Volume 1. Literature assessment, waste/soil characterization, loading-rate selection. Final report.** Sims, R.C.; Sims, J.L.; Sorensen, D.L.; Hastings, L.L.; Doucette, W.J. (Utah State Univ., Logan (USA). Utah Water Research Lab.). Oct 1986. 170p. NTIS, PC A08/MF A01.

The two-volume report presents information pertaining to quantitative evaluation of the soil-treatment potential resulting from waste-soil interaction studies for four specific wastes-listed under Section 3001 of the Resource Conservation and Recovery Act (RCRA). Volume 1 contains information from literature assessment, waste-soil characterization, and treatability screening studies for each selected waste. The scope of the study involved assessment of the potential for treatment of these hazardous wastes using soil as the treatment medium.

16222 **(PB—87-111746/XAB) Waste/soil treatability studies for four complex industrial wastes: methodologies and results. Volume 2. Waste loading impacts on soil degradation, transformation, and immobilization. Final report.** Sims, R.C.; Sorensen, D.L.; Doucette, W.J.; Hastings, L.L.; Sims, J.L. (Utah State Univ., Logan (USA). Utah Water Research Lab.). Oct 1986. 255p. NTIS, PC A12/MF A01.

The two-volume report presents information pertaining to quantitative evaluation of the soil-treatment potential resulting from waste-soil interaction studies for four specific wastes listed under Section 3001 of the Resource Conservation and Recovery Act. Volume 2 contains results from bench-scale waste-soil interaction studies; degradation, transformation, and immobilization data are presented for four specific wastes: API separator sludge, slop oil emulsion solids, pentachlorophenol wood preserving waste, and creosote wood-preserving waste. The scope of the study involved assessment of the potential for treatment of these hazardous wastes using soil as the treatment medium.

16223 **Energy savings in the industrial sector - An overview.** Streb, A.J. (US Dept. of Energy, Washington, DC). pp 391-395 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—).

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

The purpose of this presentation is to give the audience an overview of the industrial sector's present and projected energy consumption, the potential for energy savings in the sector's most energy-intensive industries, and areas of advanced technology that can produce significant energy savings in the future with special emphasis on the contributions which will be made by materials technologies.

16224 **Pulp and paper industry energy impacts through implementation of biotechnologies.** Griffin, E.A. pp 211-214 of Proceedings of the 1984 research and development conference. Atlanta, GA; Tappi Press (1984). (CONF-8409153—).

From TAPPI research and development conference; Appleton, WI, USA (30 Sep 1984).

Innovative biodegradation techniques have been developed to handle organic wastes from both the chemical and pulp and paper industries. These innovative methods used some type of aerobic microbial degradation to reduce biological oxygen demand (BOD), chemical oxygen demand, (COD), and total dissolved solids. Some of the techniques studied are: series lagoons, high-volume activated sludge, pure oxygen aeration, and deep-shaft aeration. Deep-shaft aeration, which uses pressure to increase oxygen transfer during biodegradation of wastes, requires the least energy per kg of BOD removed. Energy requirements for the four methods are presented.

The booklet contains 5 different speeches of the colloquium on waste management. The topics include ecological waste product utilization, various technological methods, requirements refuse-fueled heating power stations have to fulfill, and alternative ways of waste product utilization.

16226 (CONF-8412124—Exc., pp 51-55) **Waste management concept for the south western and southern Palatinate.** Toepfer, K. Jun 1986. (In German). NTIS (US Sales Only), PC A03. File Number DE87751306.

From Experts discussion on a waste management concept for the south western and southern Palatinate; Pirmasens, F.R. Germany (10 Dec 1984).

Abfallwirtschaft in Rheinland-Pfalz. No. 3.

In addition to the reduction or avoidance of waste products, the political concept of the government of Rhineland-Palatinate

contains following alternatives: composting; recycling of materials; energy recovery by incineration; sorting of waste products; storing.

16227 **(PB—87-109179/XAB) Simulation of heat losses and ground temperatures for district-heating culverts. Comparison with field experiments for well-insulated, damaged, and extra-insulated culverts.** Hagentoft, C.E. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 74p. (D—16:1986). NTIS, PC PC E04/MF E01.

Many old district-heating culverts are in bad condition due to the entry of water into the thermal insulation. The thermal conductivity, and thereby the heat loss from the culvert, is much larger for a wet than a dry thermal insulation. The high energy prices make it interesting and necessary to find the water-damaged parts of the district-heating culvert and improve the thermal insulation so that a reduction in the heat losses is obtained. The aim of the project is to develop a simple field method to determine the heat loss and the condition of the culvert. The method is based on the measurement of the temperature on the top of the culvert and a classification of the soil. The classification of the soil gives an estimation of its thermal conductivity. The heat loss and the reduction in heat loss due to an extra insulation is estimated from these data. Five different types of culverts were tested: two types of asbestos cement culverts, one concrete culvert, and two aerated concrete culverts. The comparison of the measured temperatures and the temperatures obtained from the simulations is reported in the study.

33 ADVANCED AUTOMOTIVE PROPULSION SYSTEMS

3301 Internal Combustion Engines

16228 **(N—87-11790) Compound cycle engine program.** Bobula, G.A.; Wintucky, W.T.; Castor, J.G. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1986. 23p. (NASA-TM—88879; E—3286; NAS—1.26:88879; USAAVSCOM-TR—86-C-37; CONF-861128—1). NTIS, PC A02/MF A01.

From 10. scientific meeting of the Society for Reactor Safety; Cologne, F.R. Germany (12 Nov 1986).

The Compound Cycle Engine (CCE) is a highly turbocharged, power compounded power plant which combines the lightweight pressure rise capability of a gas turbine with the high efficiency of a diesel. When optimized for a rotorcraft, the CCE will reduce fuel burned for a typical 2 hr (plus 30 min reserve) mission by 30 to 40 percent when compared to a conventional advanced technology gas turbine. The CCE can provide a 50 percent increase in range-payload product on this mission. A program to establish the technology base for a Compound Cycle Engine is presented. The goal of this program is to research and develop those technologies which are barriers to demonstrating a multicylinder diesel core in the early 1990's. The major activity underway is a three-phased contract with the Garrett Turbine Engine Company to perform: (1) a light helicopter feasibility study, (2) component technology development, and (3) lubricant and material research and development. Other related activities are also presented.

16229 **(PB—87-112512/XAB) Technology and market assessment of gas-fueled vehicles in New York State.** (Mueller Associates, Inc., Baltimore, MD (USA)). Aug 1983. 654p. NTIS, PC PC E99.

16230 **(PB—87-112520/XAB) Technology and market assessment of gas-fueled vehicles in New York State. Volume 1. Executive summary. Final report.** (Mueller Associates, Inc., Baltimore, MD (USA)). Aug 1983. 81p. NTIS, PC A05/MF A01.

Also available in set of 3 reports PC E99, PB87-112512.

The three-volume report details an investigation into the technical and economic feasibility and market potential of gaseous-fuel use in New York State highway fleet vehicles. The conversion of gasoline-fueled vehicles to the alternative fuels - compressed natural gas, liquefied natural gas, propane and liquefied petroleum gases - was assessed based on various issues and problems: the state of the art of gas-fueled vehicles and refueling equipment; the economics of conversion; current research activities; future specific research and development needs; and public actions that could further conversion in the state. Benefits of conversion include reduced dependence on gasoline and diesel fuel, reduced air pollution, and development of indigenous New York State sources of these alternative fuels.

16231 **(PB—87-112538/XAB) Technology and market assessment of gas-fueled vehicles in New York State. Volume 2. Technology and economic assessment. Final report.** (Mueller Associates, Inc., Baltimore, MD (USA)). Aug 1983. 332p. NTIS, PC A15/MF A01.

Also available in set of 3 reports PC E99, PB87-112512.

The contents of Volume II deal primarily with the technology and economics of vehicle conversion, refueling equipment design, etc. for using gaseous fuels in transportation vehicles. Other issues explored include safety considerations, vehicle exhaust emissions when using gaseous fuels, sensitivity analyses of the economic parameters of fleet-vehicle conversions, identification of the best fleets for conversion, new developments in gaseous-fuel storage and compressor design plus research and development needs.

16232 **(PB—87-112546/XAB) Technology and market assessment of gas-fueled vehicles in New York State. Volume 3. Institutional barriers and market assessment. Final report.** (Mueller Associates, Inc., Baltimore, MD (USA)). Aug 1983. 241p. NTIS, PC A11/MF A01.

Also available in set of 3 reports PC E99, PB87-112512.

The contents of Volume III deal primarily with the institutional barriers and market forces affecting the potential conversion of vehicles in New York State (NYS) to gaseous fuels. The results of a market-research survey are presented along with the current supply conditions for fuels in NYS. The indigenous resources of gaseous fuels in NYS are identified and quantified. The potential number of vehicles in NYS that are favorable candidates for conversion are estimated, and the effect of these potential gaseous-fueled vehicles on NYS gaseous fuels supplies is presented.

16233 **(PB—87-113338/XAB) Battery-powered vehicle research in South Africa.** Anderson, R.B.; van Niekerk, H.R. (Council for Scientific and Industrial Research, Pretoria (South Africa). National Electrical Engineering Research Inst.). 1982. 18p. NTIS, PC PC E04/MF E04.

North American Continent sales only.

The systems described comprise, an automatic microprocessor control of a gearbox drive system, the development of an optimized disc motor design, a partial hydrostatic/electric-drive system, a novel 9-phase ac drive, developments in control and power-switching technology for both ac and dc drives, and machine design criteria for electric motors having power electronic controllers.

3304 Hybrid Systems

16234 **(CONF-8610122—12) Batteries for hybrid vehicles or other high-power applications.** Miller, J.F.; Lee, J.; Christianson, C.C. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 8p. NTIS, PC A02. File Number DE87004928.

From 8. international electric vehicle symposium ↑; 0.

Argonne National Laboratory conducted a study to identify promising battery designs for application in future hybrid vehicles (HVs). A preliminary set of battery requirements for HVs was established using information available from previous studies and also by contacting potential HV developers worldwide. The consensus

of the information obtained indicated that, as compared with the electric vehicle battery, the HV battery will be smaller and lighter, must have higher power capability per unit weight and will, on the average, be discharged at higher rates. Based upon the preliminary battery requirements, many different battery technologies proposed for the hybrid-vehicle mission were evaluated. Although no existing battery presently developed satisfies all of the preliminary requirements, the analysis has shown that several battery types, with appropriate redesign and development, are good candidates for meeting the hybrid-vehicle application requirements.

3307 Emission Control

16235 **(NP—7770061) Studies on air pollution by lead, zinc, iron, and 3,4-benzopyrene due to traffic in a small town.** Plecher, K. (Erlangen-Nuernberg Univ., Erlangen (Germany, F.R.). Medizinische Fakultaet). 10 Jan 1983. 60p. (In German). NTIS (US Sales Only), MF A01. File Number DE87770061.

To determine the pollution load caused for a small town by automobile traffic, this work, contrary to tests conducted normally on particulates, determined the concentrations of lead, zinc, iron and 3,4-benzopyrene, as specific parameters of automobile traffic, in the road dust of Herzogenaurach (inhabitants in 1980: approximately 17,000). The results clearly show the different levels of traffic-related pollution in different parts of the town. In residential areas the particulates samples investigated carried only about one half to one third of the pollutants Pb, Zn, Fe, benzopyrene as compared to those from the centre of the town (here: 0.87 mg lead/g particulates and 0.75 mg zinc/g particulates). As compared with the nearby city of Erlangen, pollution levels are three to four times lower. Between the different compounds, there exist in part close relationships. Especially for the relations of heavy metals to each other, but also of lead to 3,4-benzopyrene, almost always high correlation coefficients of r=+0.6 to r=+0.9 are calculated. The results show the analysis of samples of road particulates for automobile-specific pollutants to be a practicable method by which traffic-related immission loads also for large areas can be evaluated at long term. It is a method requiring little material and involving reasonable amounts of time, and one permitting a great evaluation density.

16236 **(SAND—86-2759) Residual effects in laminated, curved, composite panels.** Reuter, R.C. Jr. (Sandia National Labs., Albuquerque, NM (USA)). Jan 1987. Contract AC04-76DP00789. 20p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005624.

Analytical techniques were employed to characterize residual effects induced in laminated, curved, composite panels during fabrication processing. The residual effects include circumferential residual stresses which develop while the laminated panel is in place over its mold, and a change in panel curvature which occurs following release of the panel from the mold and relief of the residual stresses. The analysis was utilized to predict the radium of a mold upon which panels could be fabricated so that they deform, upon release from the mold, to a predetermined radius of curvature. Sample panels were fabricated which provided experimental data and particle verification of the analytical methods developed.

(Argonne National Lab., IL (USA)). Jan 1987. Contract W-31109-ENG-38. 85p. NTIS, PC E04/MF A01; GPO Dep. File Number DE87005645.

Includes 1 sheet of 48x reduction microfiche.

This report documents Argonne National Laboratory's review of an internal technical memorandum prepared by Battelle Memorial Institute's Office of Nuclear Waste Isolation (ONWI) entitled Multifactor Test Design to Investigate Uniform Corrosion of Low-Carbon Steel in a Nuclear Waste Salt Repository Environment. The several major areas of concern identified by peer review panelists are important to the credibility of the test design proposed in the memorandum and are to adequately addressed there. These areas of concern, along with specific recommendations to improve their treatment, are discussed in detail in Sec. 2 of this report. The twenty recommendations, which were abstracted from those discussions, are presented essentially in the order in which they are introduced in Sec. 2.

16238 **(BARC—1244) Thermodynamic data of intermetallic compounds.** (Bhabha Atomic Research Centre, Bombay (India)). 1984. 28p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701244.

The data are presented in the alphabetical order of the chemical symbol for the elements. Each table presents the data of a group of binary intermetallic compounds with a common first component. For example, Table 1 shows the data of all binaries of silver. The table lists the properties indicated. For completeness, the experimental methods used in obtaining the data are also listed in the remarks column. The units are kJ mol/sup -1/ for all energy quantities and J K/sup -1/ mol/sup -1/ for entropies. 38 tables.

16239 **(BMFT-FB-T—86-109) Fuel savings by controlling SiO/sub 2/ reduction in blast furnaces. Pt. 1. Laboratory research into the mechanism of SiO/sub 2/ reduction. Final report.** Beppler, E.; Janhsen, U. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Dec 1986. 96p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE87751300.

The aim of this work was to research the mechanism of the SiO/sub 2/ reaction with coke in pure SiO/sub 2/, SiO/sub 2/-Fe/sub 2/O/sub 3/, and SiO/sub 2/-Fe/sub 2/O/sub 3/-CaO-mixtures, ores, pellets and sinters of different basicity, as well as SiO/sub 2/-reduction from the coke ash. It was also investigated to what extent the SiO/sub 2/ reduction took place in coke removed from the blast furnace. SiO/sub 2/ reacts in stages as a function of the temperature as follows: 1.) SiO/sub 2/+2C/sub Fe/=Si/sub Fe/+2 CO; 2.) SiO/sub 2/+2C/sub Fe/(+Fe)=Fe/sub Si/+2 CO; 3.) SiO/sub 2/+3 C=SiC+2 CO; 4.) SiO/sub 2/+C=SiO+CO. The reduction of pure SiO/sub 2/ with carbon begins at 1400/sup 0/C and exhibits the strongest reaction at 1600/sup 0/C. Here, the formation of SiC and gaseous SiO overlap. The tests on SiO/sub 2/-Fe/sub 2/O/sub 3/-mixtures show that SiO/sub 2/ reduction starts only after the reduction of the Fe-oxide to C-saturated Fe has been fully completed. The reaction leading to SiC and SiO takes place here only after saturation of the Fe with Si following the Si/sub Fe/ and FeSi reactions. The reduction mechanism for the coke SiO/sub 2/ is the same. The presence of CaO encourages the partical reactions taking place at higher temperatures. In pellets, ores, and sinter, the SiO/sub 2/ reaction takes place almost exclusively by means of Si/sub Fe/ because of the high Fe-oxide level. In sinters with a higher basicity, Si/sub Fe/ is suppressed in favour of partial reactions taking place at higher temperatures. Measurements of coke removed from the tuyere level show appreciably reduced

oxide contents compared with the input coke. With 51 refs., 5 tabs., 49 figs.

16240 **(BNL—39052) Annealing of cold worked hypostoichiometric Ni_3Al alloys using positron lifetime spectroscopy.** Usmar, S.G.; Lynn, K.G. (Brookhaven National Lab., Upton, NY (USA)). 1 Dec 1986. Contract AC02-76CH00016. 5p. (CONF-861207—55). NTIS, PC A02. File Number DE87005248.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

Hypostoichiometric Ni_3Al alloys of composition 76.2 Ni:23.8 Al containing impurity levels of boron and hafnium were either cold rolled or pressed. Rolled and pressed samples were deformed by 20% and 10% thickness reductions, respectively. Samples were annealed isochronally at approximately 50°C intervals up to 1050°C. Two major annealing stages were apparent in all three alloys studied. These could be attributed to vacancy migration to sinks and annealing of dislocations and(or) recrystallization. The onset of vacancy migration occurred at approximately 200°C in all three alloys. Annealing of dislocations started at 650°C to 700°C and was complete at 1000°C for alloys which contained boron and or hafnium impurities. In the pure alloy the onset of dislocation annealing occurred at 800°C and was incomplete at the highest (1050°C) annealing temperatures reached.

16241 **(BNL—39096) Modification of the properties of metal overlayers on Nb(110) and Ta(110).** Ruckman, M.W.; Strongin, M.; Pan, X. (Brookhaven National Lab., Upton, NY (USA); Queens Coll., New York (USA). Dept. of Physics). 1986. Contract AC02-76CH00016. 11p. (CONF-861207—44). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004606.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

Modification of the physical and chemical properties of noble and near-noble metal monolayer films supported on Nb(110) and Ta(110) is demonstrated using photoemission and LEED. Strong adlayer-substrate bonding leads to the formation of two-dimensional coherent Pd or Pt overlayers at low coverage ($\theta < 0.7$ ML). Ni and Cu form one-dimensional coherent structures because the additional interfacial misfit cannot be overcome by substrate-overlayer bonding. In the case of Ag and Au overlayers, slightly strained pseudomorphic structures are formed because the lattice misfit is small. The strong overlayer-substrate bonding produces large changes in the chemical activity of near-noble metal overlayers. Photoemission measurements on Pt monolayers show that the hybridized metal d-states are shifted further below the Fermi level "E/sub F/" and show a reduction in the surface density of states at E/sub F/. This absence of bonding d-states near E/sub F/ effects CO chemisorption. However, as additional layers of Pd and Pt are deposited, the d-occupancy at E/sub F/ grows, with "constant" atomic structure and the amount of CO increases. Hence, in these systems chemisorption changes can be studied as a function of changing electronic structure while holding the surface structure fixed.

16242 **(BNL—52049) Hydrogen degradation of pipeline steels: Final report.** Holbrook, J.H.; Collings, E.W.; Cialone, H.J.; Drauglis, E.J. (Battelle Columbus Labs., OH (USA); Brookhaven National Lab., Upton, NY (USA)). Mar 1986. Contract AC02-76CH00016. 163p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE87005585.

Purpose of investigations conducted by Battelle Columbus Laboratories was to develop a research data base applicable to the problem of hydrogen degradation in pipeline steels. The findings would provide pipeline designers and operators with insight for developing specifications and procedures in the event available natural gas transmission/distribution systems are used for hydrogen transport. Fundamental investigations and data derived from sophisticated analytical and test procedures have been equated to practical field conditions and experiences as may be encountered should the hydrogen energy storage/transport option become an economic reality.

16243 **(CEA-CONF—8483) Ductility of materials under dynamic solicitations.** Dormeval, R.; Ansart, J.P. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 92 - Montrouge (France)). Jun 1986. 17p. (In French and English). (CONF-860616—11). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750572.

From International symposium on intense dynamic loading and its effects; Beijing, China (3 Jun 1986).

We present some aspects of the measurement of the material ductility at high strain-rates (> equal to 10^3 s^{-1}). After a short recall of the experimental methods, we show the results obtained on several materials by means of dynamic tensile tests and explosive expanding shells. These results are discussed in regard to the mechanisms of deformation, and to the parameters which can influence the evolution of ductility. Examples are given for copper, aluminium alloys, titanium alloys and uranium alloys: UMo 1.5 and UV 0.2.

16244 **(CEA-CONF—8553) European effort on materials.** Ehrlich, K.; Calza Bini, A.; Brown, C.; Lippens, M.; Levy, V. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Sep 1986. 17p. (CONF-860931—4). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750557.

From International conference on reliable fuels for liquid metal reactors; Tucson, AZ, USA (7 Sep 1986).

The increase in target burnup needed to make the LMFBR economically competitive with other electrical energy sources is today mainly limited by the excessive swelling of the austenitic stainless steels used as cladding and wrapper tube materials, though the actual limits of commercial austenitic stainless steels have not yet been determined. Improved austenitic stainless steels, like higher Ni-bearing alloys and modified 15Cr-15Ni alloys, offer the short term possibility of an increase in burnup, which might approach the 18 - 20% h.a. (>150 dpa) set for SUPERPHENIX 2, SNR-2 and CDFR projects. High nickel alloys show acceptable swelling behaviour at high dose, but irradiation-induced embrittlement problems may limit their use. Ferritic/martensitic steels are swelling resistant but their low creep strength limits their application to wrapper tubes. EM10, FV448 and 1.4914 are considered promising steels with their susceptibility to low temperature embrittlement being controlled by optimization of chemical composition and thermal treatment. Oxide dispersion strengthened ferritic steels with high thermal creep resistance have been developed for cladding application. 26 refs.

16245 **(CEA-CONF—8562) Principal modes of rupture encountered in expertise of advanced components.** Tavassoli, A.A.; Bougault, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Oct 1986. 8p. (In French). (CONF-861027—2). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750473.

From 5. international conference on reliability and maintainability; Biarritz, France (6 Oct 1986).

Failure of many metallic components investigated can be classified into two categories: intergranular or transgranular according to their principal mode of rupture. Intergranular ruptures are often provoked by segregation of impurities at the grain boundaries. Three examples are cited where this phenomenon occured, one of them is a steel (A 508 cl 3) used for PWR vessel. Intergranular failures are in general induced by fatigue in the advanced components operating under thermal or load transients. One example concerning a sodium mixer which was subjected to thermal loadings is presented. Examples of stress corrosion and intergranular sensitization failures are cited. These examples show the importance of fractography for the determination of rupture causes.

16246 **(CEA-CONF—8563) Surface quenching of zirconium alloys by laser.** Richard, A.; Charissoux, C.; Calvet, J.N. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Oct 1986. 5p. (In French). (CONF-8610153—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750474.

From Autumn metallurgy meeting; Paris, France (14 Oct 1986).

Nodular type corrosion of Zircaloy occurs in aqueous media at high temperature, an improvement is obtained by quenching from the β domain or even $\alpha + \beta$ because of fine structure, size and distribution of precipitates. Surface heat treatments improve corrosion resistance, mechanical properties are preserved by non-transformed alloy. Very fast heat treatment is required to avoid damage to the underlying structure, laser beam allows a high energy treatment in very short time. Penetration versus laser power and microhardness versus depth of treatment and structure are examined.

16247 **(CONF-860789—4) Computer simulation of "special" grain boundaries in metals and ionic materials.** Wolf, D. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004989.

From International workshop on condensed matter theories; Argonne, IL, USA (21 Jul 1986).

In recent years a set of lattice statics computer codes has been developed which permits one to determine the energies, structures, and point-defect properties of grain boundaries in metals and predominantly ionic ceramic materials. In contrast to metals, long-range Coulomb forces between the ions have to be considered in ionic bicrystals. The selection criteria for the identification of "special" (i.e., low-energy) grain boundaries (GBs) is discussed with particular emphasis on (1) the role of the GB plane, (2) the influence of the planar unit-cell area, and (3) the effect of the interatomic potential on the predicted energies and structures of GBs in metals and ionic materials.

16248 **(CONF-860953—5) Atomic-defect mechanisms for diffusion in refractory bcc metals.** Siegel, R.W.; Mundy, J.N.; Smedskjaer, L.C. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004653.

From International conference on vacancies and interstitials in metals and alloys; Berlin, F.R. Germany (14 Sep 1986).

Despite a number of recent investigations into the nature and properties of equilibrium atomic defects in the refractory bcc metals, the mechanisms responsible for the high-temperature mass transport in these materials are not clear. The observed strong high-temperature enhancement in self-diffusion appears to be unexplainable in terms of divacancies, but might result from the presence of small equilibrium concentrations of highly-mobile self-interstitials. Recent vacancy formation measurements in Cr appear to support this view. However, recent studies of diffusion in Nb(W) alloys and high-temperature vacancy migration in W have raised new issues to be considered.

16249 **(CONF-860953—6) Diffusion and ion mixing in amorphous alloys.** Hahn, H.; Averback, R.S.; Ding, F.; Loxton, C.; Baker, J. (Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004677.

From International conference on vacancies and interstitials in metals and alloys; Berlin, F.R. Germany (14 Sep 1986).

Tracer impurity diffusion and ion beam mixing in amorphous (a-)$Ni_{50}Zr_{50}$ were measured. A correlation between the metallic radius of an impurity and its tracer diffusivity was observed; it is similar to that found in crystalline α-Zr and α-Ti. In addition, the temperature dependence of diffusion in a-NiZr exhibits Arrhenius behavior. Ion beam mixing of different impurities in a-NiZr correlates with tracer diffusivity at both high and low temperatures. At higher temperatures radiation enhanced diffusion (RED) was observed. The activation enthalpy of the RED diffusion coefficient is 0.3 eV/atom.

16250 **(CONF-860953—7) Production of freely-migrating defects during irradiation.** Rehn, L.E.; Okamoto, P.R. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004652.

From International conference on vacancies and interstitials in metals and alloys; Berlin, F.R. Germany (14 Sep 1986).

During irradiation at elevated temperatures, vacancy and interstitial defects that escape can produce several different types of microstructural changes. Hence the production rate of freely-migrating defects must be known as a function of irradiating particle species and energy before quantitative correlations can be made between microstructural changes. Our fundamental knowledge of freely-migrating defect production has increased substantially in recent years. Critical experimental findings that led to the improved understanding are reviewed in this paper. A strong similarity is found for the dependence of freely-migrating defect production on primary recoil energy as measured in a variety of metals and alloys by different authors. The efficiency for producing freely-migrating defects decreases much more strongly with increasing primary recoil energy than does the efficiency for creating stable defects at liquid helium temperatures. The stronger decrease can be understood in terms of additional intracascade recombination that results from the nonrandom distribution of defects existing in the primary damage state for high primary recoil energies. Although the existing data base is limited to fcc materials, the strong similarity in the reported investigations suggests that the same dependence of freely-migrating defect production on primary recoil energy may be characteristic of a wide variety of other alloy systems as well. 52 refs., 4 figs.

16251 **(CONF-860953—8) Calculation of the properties of vacancy clusters in copper using a new, efficient energy minimization scheme.** Sabochick, M.J.; Yip, S.; Lam, N.Q. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering; Argonne National Lab., IL (USA)). Dec 1986. Contract W-31109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004845.

From International conference on vacancies and interstitials in metals and alloys; Berlin, F.R. Germany (14 Sep 1986).

A modification of the Fletcher-Powell optimization method has been applied to the molecular statics calculation of migration and binding energies of vacancy clusters in copper. Using a recently developed pseudopotential, the tri- and tetravacancy migration energies were found to be 0.56 eV and 0.38 eV, respectively. The collapse of hexagonal and triangular platelets of 10 or more vacancies was found to result in hexagonal faulted loops and stacking fault tetrahedra, respectively, the latter being more stable in the sense of having a higher binding energy. The displacement field in the near vicinity above the loops showed significant deviations from the predictions of anisotropic linear elasticity theory.

16252 **(CONF-860953—10) Vacancy migration enthalpy in tungsten at high temperatures.** Mundy, J.N.; Ockers, S.T.; Smedskjaer, L.C. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004664.

From International conference on vacancies and interstitials in metals and alloys; Berlin, F.R. Germany (14 Sep 1986).

The curvature found in the Arrhenius plot for tungsten self-diffusion has been commonly interpreted in terms of simultaneous diffusion by two different defect processes. An alternative interpretation has been made in terms of the temperature dependence of the migration enthalpy and/or the formation enthalpy for single vacancies. In order to study the magnitude of the temperature dependence for the migration enthalpy, the present interrupted quenching experiments studied the annealing of a supersaturation of vacancies at high temperatures in tungsten. The temperature dependence of H/sup m//sub 1v/ found in the present experiments is insufficient to explain the Arrhenius curvature found for self-diffusion in tungsten. However, the curvature could be explained if the formation enthalpy, H/sup f//sub 1v/ had a temperature dependence of similar magnitude.

16253 **(CONF-861068—16) The corrosion of metals and alloys by sodium polysulfide melts at 350°C.** Brown, A.P.; Battles, J.E. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 2p. NTIS, PC A02. File Number DE87005028.

From Electrochemical Society fall meeting; San Diego, CA, USA (19 Oct 1986).

In conclusion, based solely on consideration of corrosion resistance, molybdenum is the only metal or alloy that can be recom-

mended as a positive current collector/container material for the Na/S cell. If the metal or alloy were to be used as a substrate for a corrosion resistant coating, then the best metal or alloy to provide adequate protection against coating defects, would be a stainless steel with a composition near to Fe-^{26}Cr-^{3}Mo, such as Ferralium 255.

16254 **(CONF-861111—18) Magnetic properties of novel epitaxial films.** Bader, S.D.; Moog, E.R. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 25p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004744.

From Conference on magnetism and magnetic materials; Baltimore, MD, USA (17 Nov 1986).

The surface magneto-optic Kerr effect (SMOKE) is used to explore the magnetism of ultra-thin Fe Films extending into the monolayer regime. Both bcc α-Fe and fcc γ-Fe single-crystalline, multilayer films are prepared on the bulk-terminated (1 x 1) structures of Au(100) and Cu(100), respectively. The characterizations of epitaxy and growth mode are performed using low energy electron diffraction and Auger electron spectroscopy. Monolayer-range Fe/Au(100) is ferromagnetic with a lower Curie temperature than bulk α-Fe. The controversial γ-Fe/Cu(100) system exhibits a striking, metastable, surface magnetic phase at temperatures above room temperature, but does not exhibit bulk ferromagnetism.

16255 **(CONF-861111—19) Magnetic phase transitions in nanocrystalline erbium.** Cowen, J.A.; Stolzman, B.; Averback, R.S.; Hahn, H. (Michigan State Univ., East Lansing (USA). Dept. of Physics; Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004724.

From Conference on magnetism and magnetic materials; Baltimore, MD, USA (17 Nov 1986).

Nanocrystalline samples of 99.9% pure erbium with particle sizes between 10 and 70 nm have been produced by the inert gas condensation technique. Magnetic susceptibility measurements on samples compacted to between 50 and 75% of bulk density indicate a modification in the high temperature phases and superparamagnetic behavior at low temperatures. ESR signals near g = 10 are probably due to Er compounds which may form during the production process.

16256 **(CONF-861185—2) Phases in U-Si alloys.** Domagala, R.F. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 18p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004830.

From Reduced Enrichment for Research and Test Reactors (RERTR) program international meeting; Gatlinburg, TN, USA (3 Nov 1986).

The binary (two component) U-Si system contains a total of seven "compounds." The most U-rich compounds are of interest to the RERTR community because they are now being employed as fuels in research and test reactors. The nomenclature used in describing these fuels and the metallurgical significance of the notations recorded may have different meanings to people from different technical backgrounds. This paper is a succinct exploration of the principles of phase equilibria and the realities of commerical fabrication as applied to U-Si alloys. It is an attempt to record in referenceable and retrievable form information of value to the continued development, application and understanding of silicide fuels.

16257 **(CONF-861207—43) Detection of near-surface ^{52}Cr segregation in irradiated ^{51}V(Cr) by RBS [Rutherford Backscattering Spectrometry].** Rehn, L.E.; Baldo, P.M. (Argonne National Lab., IL (USA)). Nov 1986. Contract W-31109-ENG-38. 7p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004684.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

Irradiation at elevated temperatures of V(Cr) alloys is known to create a near-surface layer of nonequilibrium Cr enrichment. Highly reproducible RBS spectra were accumulated from a V-15%Cr alloy irradiated at 750°C, and from unirradiated portions of the same specimen. Differences between these spectra are used to demonstrate the high sensitivity of conventional RBS techniques for determining near-surface segregation behavior. Sensitivities obtained utilizing differences in the acquired spectra are much higher than those typically assumed for RBS measurements. Using 1.8 MeV ^{4}He, and conventional RBS equipment and scattering geometries, segregation of ≦2 atomic layers of ^{52}Cr in ^{51}V-15 at. %Cr over a depth of ~5 nm has been observed.

16258 **(CONF-861207—46) Effect of aluminum addition on ductility and yield strength of Fe_3Al alloys with 0.5 wt % TiB_2.** McKamey, C.G.; Horton, J.A.; Liu, C.T. (Oak Ridge National Lab., TN (USA)). Dec 1986. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004621.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

Studies have been conducted of the mechanical properties of Fe_3Al alloys containing 24 to 30 at. % Al, to which 0.5 wt % TiB_2 was added for grain refinement. In tensile tests conducted at room temperature, it has been found that, as the aluminum content is increased, the yield strength decreases sharply from 760 to 310 MPa. The decrease in yield strength is accompanied by a four-fold increase in room-temperature ductility. Ordered iron aluminides (containing no disordered α phase) showed a clear increase in yield strength with temperature above 300°C. Their strength reached a maximum around 600°C, above which it decreased sharply. All these results are discussed and correlated with stability of superlattice dislocations as a function of aluminum content.

16259 **(CONF-861207—48) The role of energetic displacement cascades in ion beam modifications of materials.** Averback, R.S.; Kim, S.J.; Diaz de la Rubia, T. (Argonne National Lab., IL (USA); California Inst. of Tech., Pasadena (USA); State Univ. of New York, Albany (USA)). Dec 1986. Contract W-31109-ENG-38. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004721.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

The roles of energetic displacement cascades are ubiquitous in the fields of radiation damage and ion beam modifications of materials. These roles can be described on two time scales. For the first, which lasts $\approx 10^{-11}$ s, small cascade volumes are characterized by large supersaturations of point defects and energy densities in excess of some tenths of eV's per atom. During this period, the system can be driven far from equilibrium with significant rearrangement of target atoms and the production of Frenkel pairs. Studies of ion beam mixing in conjunction with molecular dynamics computer simulations, have contributed largely toward understanding these dynamic cascade processes. At later times, the microstructure of the material evolves as cascades begin to overlap, or at elevated temperatures, point defects migrate away from their nascent cascades. It is shown how the primary state of damage in cascades influences this microstructural development. Examples involving radiation enhanced diffusion and ion-induced amorphization are discussed. 40 refs.

16260 **(CONF-861207—49) Elastic properties of superlattices.** Grimsditch, M. (Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004835.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

A calculation of the effective elastic moduli of a superlattice, in terms of the elastic moduli of its constituents, is presented. Contrary to what has been found in many real systems, these calculations show that in the long wavelength limit the effective elastic moduli are independent of the modulation wavelength. A discussion of the experimental results on Nb/Cu, Mo/Ni and Au/Cr shows that the elastic anomalies can be understood on the basis of concomitant changes in lattice spacings.

16261 **(CONF-861207—50) Formation of submicron metastable phase structures in alloys with focused electron or proton beams.** Lam, N.Q.; Okamoto, P.R.; Leaf, G.K. (Argonne National Lab., IL (USA)). Nov 1986. Contract W-31109-ENG-38. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004722.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

Recent theoretical and experimental studies of radiation-induced segregation in alloys under irradiation with focused charged-particle beams have shown that point-defect currents generated by axial and radial displacement-rate gradients can cause significant redistribution of the alloying elements within the irradiated zone. In the case of irradiation of thin films with highly-focused electron beams, two important features have been established experimentally: (1) the diameter of the local region in which the alloy composition and phase are modified is practically equal to the beam diameter, and (2) the time required to produce a given change in the alloy composition in the center of the irradiated zone decreases rapidly with beam diameter. Our theoretical modeling indicates that these features will also be observed in semi-infinite alloys bombarded with focused proton beams. However, in this case, the spatially-nonuniform defect production in both the axial and radial directions renders the compositional redistribution more complex. The present work shows that the ability to locally modify the alloy composition by focused electron or proton beams may offer a new method for producing local regions of controlled composition and microstructure on a submicron scale. The results of our model calculations and experimental studies will be presented to demonstrate the feasibility of this novel technique.

16262 **(CONF-861207—51) Precipitation of Kr in Ni at room temperature.** Birtcher, R.C.; Liu, A.S. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004723.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

The fluence dependence of Kr precipitation in Ni at room temperature has been studied with the aid of Transmission Electron Microscopy. As in other metals, the Kr precipitates in small cavities. Electron diffraction demonstrates that the Kr precipitates are solid, fcc crystals aligned with each other and the Ni lattice. The trends are similar to those observed for Kr precipitation in Al at room temperature. The average Kr lattice parameter, determined from the electron diffraction, increases with increasing Kr fluence from 0.515 nm to an asymptotic value of 0.545 nm. The asymptotic limit is due to the melting of the larger Kr precipitates. The mismatch between the Kr and Ni lattices is as large as 55%. Diffuse electron scattering was observed from large, liquid, Kr precipitates. This occurs for Kr fluences above 5×10^{20} $Kr^{+}m^{-2}$ in Ni and above 2.5×10^{20} $Kr^{+}m^{-2}$ in Al. At room temperature, the largest solid Kr precipitate observed in dark field images was 8.3 nm in diameter compared to 4.7 nm in Al. The larger precipitates are liquid or gas. The solid Kr metals at the same lattice parameter in both Ni and Al suggest that the melting is thermodynamic in nature and independent of the host material.

16263 **(CONF-861207—52) Effects of gamma radiolysis on waste package components.** Lewis, M.A.; Reed, D.T. (Argonne National Lab., IL (USA); Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 1986. Contract W-31109-ENG-38. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004866.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

Short-term experiments which studied the effect of gamma radiation on the waste package components of a basaltic repository were completed. Experimental parameters were similar to those expected during the saturated post-closure period of the repository, i.e., a temperature of 200°C and a hydrostatic pressure $\geq$ 70 bar. The waste package components included low carbon steel pressure vessels, synthetic ground water formulation (GR4), CH_4, basalt or packing, and low carbon steel coupons. It was found that gamma radiation at a dose rate of 10^4 rad/h for a duration of one and two months increased the H_2 yield in all tests. Increases in the organic carbon yield, the sulfate ion concentration, and the corrosion rate of the coupon were observed in some of the tests. These latter results varied with the combination of waste package components included in the tests. Evidence for the quench effect was observed in tests which included basalt.

16264 **(CONF-861207—58) Ductility and fracture behavior of polycrystalline Ni_3Al alloys.** Liu, C.T. (Oak Ridge National Lab., TN (USA)). 1986. Contract AC05-84OR21400. 13p. NTIS MF A01; 2; GPO Dep. File Number DE87005340.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

This paper provides a comprehensive review of the recent work on tensile ductility and fracture behavior of Ni_3Al alloys tested at ambient and elevated temperatures. Polycrystalline Ni_3Al is intrinsically brittle along grain boundaries, and the brittleness has been attributed to the large difference in valency, electronegativity, and atom size between nickel and aluminum atoms. Alloying with B, Mn, Fe, and Be significantly increases the ductility and reduces the propensity for intergranular fracture in Ni_3Al alloys. Boron is found to be most effective in improving room-temperature ductility of Ni_3Al with $<$24.5 at. % Al. The tensile ductility of Ni_3Al alloys depends strongly on test environments at elevated temperatures, with much lower ductilities observed in air than in vacuum. The loss in ductility is accompanied by a change in fracture mode from transgranular to intergranular. This embrittlement is due to a dynamic effect involving simultaneously high localized stress, elevated temperature, and gaseous oxygen. The embrittlement can be alleviated by control of grain shape or alloying with chromium additions. All the results are discussed in terms of localized stress concentration and grain-boundary cohesive strength. 55 refs., 10 figs., 3 tabs.

16265 **(DOE/ER/45091—3) Spin polarized photoelectron studies of magnetism in solids: Progress report for period June 1, 1986-May 31, 1987.** Rothberg, G.M. (Stevens Inst. of Tech., Hoboken, NJ (USA). Dept. of Materials and Metallurgical Engineering). Jan 1987. Contract FG02-84ER45091. 23p. NTIS, PC A02. File Number DE87005658.

The photoemission EXAFS (PEXAFS) technique has been applied to the early stages of the oxidation of aluminium. This work demonstrates the unique chemical sensitivity of PEXAFS. The near neighbor Al-O and Al-Al interatomic distances have been determined for the environments giving rise to unshifted and chemically shifted Al 2p photopeaks. Appreciable amounts of oxygen may be near an Al atom without shifting the electron binding energies and so previous measurements of others making use of the O ls extended fine structure have been misinterpreted. The first use of surface and bulk plasmon-loss electrons for EXAFS has been made. These losses are predominately by extrinsic plasmon production. An attempt was made to carry out the first PEXAFS experiment at the Berlin synchrotron radiation laboratory BESSY and this work will probably be continued. A procedure was developed for preparing thin, conducting films of MnO and spin polarized EXAFS (SPEXAFS) measurements were carried out at NSLS on MnO using the exchange split Mn 3s photopeaks and the 3p peaks. These data are being analyzed. We plan to soon put into operation facilities for MBE and for studying surface structure by means of electron energy loss extended fine structure.

16266 **(DOE/ER/45116—16) Theoretical investigation of twist boundaries in germanium.** Payne, M.C.; Bristowe, P.D.; Joannopoulos, J.D. (Massachusetts Inst. of Tech., Cambridge (USA)). Jan 1987. Contract FG02-84ER45116. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005360.

Results of the first completely ab-initio investigation of the microscopic structure of a grain boundary in a semiconductor are presented. Using the molecular dynamics simulated annealing method for performing total energy calculations within the LDA and pseudopotential approximations, the $\Sigma = 5(001)$ twist boundary in germanium is studied. A low energy structure is identified which exhibits a rigid body translation and a small contraction at the boundary.

16267 **(DOE/ER/45116—17) Lattice imaging study of grain boundaries at normal incidence to the boundary plane.** Mader, W.; Necker, G.; Babcock, S.E.; Balluffi, R.W. (Massachusetts Inst. of Tech., Cambridge (USA); Max-Planck-Institut fuer Metallforschung, Stuttgart (Germany, F.R.)). Feb 1987. Contract FG02-84ER45116. 6p. NTIS MF A01; 2; GPO Dep. File Number DE87005361.

The electron microscope lattice imaging technique has been widely used to study the atomistic structure of tilt grain boundaries. This note describes work in which information about the translational state of a boundary is obtained by the lattice imaging technique under conditions where the incident beam is aligned perpendicular to the boundary plane.

16268 **(DOE/ER/45255—1) Stress corrosion cracking and metal-induced embrittlement: Comparative studies of local chemistries: Progress report for period September 1, 1986-January 15, 1987.** Heldt, L.A.; White, C.L. (Michigan Technological Univ., Houghton (USA). Dept. of Metallurgical Engineering). Jan 1987. Contract FG02-86ER45255. 4p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004300.

This parallel study of stress corrosion cracking (SCC) and metal-induced embrittlement (MIE) is directed toward understanding a number of interesting and unexplained similarities between these two phenomena. Initial experiments are focusing on the role of local chemistries at the crack tips, both in the environment and along the microstructural fracture path in the cracked material.

16269 **(EGG-M—18286) Microstructural response of rapidly solidified 304 stainless steel powder to three consolidation techniques.** Miley, D.V.; Flinn, J.E.; Fletcher, G.L. (EG and G Idaho, Inc., Idaho Falls (USA)). 1986. Contract AC07-76ID01570. 16p. (CONF-8608153—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87000439.

From International Metallographic Society conference on microstructural science; Boston, MA, USA (3 Aug 1986).

Some of the characteristics of rapidly solidified metals, such as reduced chemical segregation and extremely fine grain size, can result in improved material properties and performance. However, these same characteristics present a challenge to the metallographer examining the microstructures of these materials, and frequently more than one technique is required to characterize the features present. This paper describes the vastly different microstructure produced in centrifugally atomized 304 stainless steel powder after consolidation by three different processes: hot isostatic pressing, extrusion, and explosive consolidation. Characterization of microstructural features depended upon a combination of optical, scanning electron, and transmission electron techniques.

16270 **(ESA-CR(P)—262) Behavior of an Inconel 718 container in the presence of hydrogen. Final report.** Azou, P.Y.; Groos, M.; Grenet; Jounier; Wehling. (Ecole Centrale des Arts et Manufactures, 92 - Chatenay-Malabry (France)). Nov 1985. 57p. (In French). (ETN—86-98147). NTIS, PC A04/MF A01.

The properties of the Inconel 718 alloy in the presence of pressurized hydrogen are reviewed. A hydrogen container for space application is studied at different temperatures, determining the hydrogen loss and the fatigue resistance. The study includes a qualification procedure to test permeability and weld quality by the acoustic emission method. The test results indicate that permeability is low, and the mechanical resistance is above twice the utilization pressure.

16271 **(EUR—10124) Stress rupture properties of austenitic steel weld metals.** Wood, D.S. (Commission of the European Communities, Luxembourg). 1985. 40p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750548.

Elevated temperature stress rupture data on Mo containing and Mo free austenitic weld metals have been collected from French, Dutch, German and UK sources and the results analysed. The stress rupture strength of Mo containing weld metal is significantly higher than that of Mo free weld metal. At 10,000h the rupture strength of Mo containing weld metal is higher than that of Type 316 steel whereas the Mo free weld metal is about 20% lower than that of Type 304 steel. Austenitic weld metal can give low stress rupture ductility values. It is concluded that there are insufficient data to permit reliable extrapolations to long times and it is recommended that long-term tests are performed to overcome this situation. 8 refs, 2 tables, 22 figs.

16272 **(EUR—10125) Tensile properties of austenitic steel weld metals.** Wood, D.S. (Commission of the European Communities, Luxembourg). 1985. 40p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750547.

Elevated temperature tensile data on Mo containing and Mo free austenitic weld metals have been collected from French, German and UK sources and the results analysed. In the as welded condition the proof strength is significantly higher than that of wrought material and Mo containing weld metal is stronger than Mo free weld metal. The differences in UTS values are not so marked, and on average at temperatures above 400° the weld metal UTS is slightly lower than that of wrought material. The ductility of weld metal is significantly lower than that for wrought material. 7 refs, 2 tables, 20 figs.

16273 **(EUR—10126) Comparison of material property specifications of austenitic steels in fast breeder reactor technology.** Vanderborck, Y.; Van Mulders, E. (Commission of the European Communities, Luxembourg). 1985. 194p. NTIS (US Sales Only), PC A09/MF A01. File Number DE87750540.

Austenitic stainless steels are very widely used in components for European Fast Breeder Reactors. The Activity Group Nr. 3 "Materials", within Working Group "Codes and Standards" of the Fast Reactor Co-Ordination Committee of the European Communities, has decided to initiate a study to compare the material property specifications of the austenitic stainless steel used in the European Fast Breeder Technology. Hence, this study would allow one to view rapidly the designation of a particular steel grade in different European countries and to compare given property values for a same grade. There were dissimilarities, differences or voids appear, it could lead to an attempt to complete and/or to uniformize the nationally given values, so that on a practical level interchangeability, availability and use ease design and construction work. A selection of the materials and of their properties has been made by the Working Group. Materials examined are Stainless Steel AISI 304, 304 L, 304 LN, 316, 316 L, 316 LN, 316"Ti stab.", 316"Nb stab"., 321, 347.

16274 **(FEI—1657) Temperature-dose dependences of porosity parameters in nickel irradiated by 1 meV nitrogen ions.** Bagdinov, V.G.; Lebedev, S.Ya. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1985. 14p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700697.

Temperature-dose dependences of swelling distribution functions for pore dimensions, average pore diameter pore concentration and total dislocation density in nickel irradiated by 1 MeV nitrogen ions are obtained. The expression which permits to describe with high accuracy the obtained temperature - dose dependence of swelling in nickel is indicated. 10 refs.; 5 figs.; 2 tabs.

16275 **(HEDL—7612) Corrosion of copper-based materials in gamma radiation.** Yunker, W.H. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1986. Contract AC06-76FF02170. 76p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87005494.

The corrosion behaviors of pure copper (CDA 101), 7% aluminum-copper bronze (CDA 613) and 30% nickel-copper (CDA 715) are being studied in a gamma radiation field of 1 x 10^5 R/h. These studies are in support of the Nevada Nuclear Waste Storage Investigations (NNWSI) Project, by Lawrence Livermore National Laboratory (LLNL), of copper-based materials for possible use in container systems for the permanent geologic burial of nuclear waste. Weight loss, tear drop (stressed), and crevice specimens of the three materials were exposed to water vapor-air atmospheres at 95°C and 150°C and to liquid water at 95°C for periods of one, three, and six months. Longer exposures are in progress. Measure-

ments include: changes in the chemical composition of the gas and water, specimen weight changes, oxide film weights, evidence of microcracking and crevice corrosion, and chemical composition of the oxide films by Auger electron spectroscopy and x-ray diffraction. Interim results show considerable pit and under-film corrosion of alloys CDA 613 and CDA 715. Uniform corrosion rates range from 0.012 mil/yr (0.30 μm/yr) to 0.22 mil/yr (5.6 μm/yr), based on specimen weight losses during six- and seven-month exposures. The time dependencies will be determined as more data become available.

16276 **(HEDL—7627) Radiation embrittlement of manganese-stabilized martensitic stainless steel.** Gelles, D.S.; Hu, W.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1986. Contract AC06-76FF02170. 13p. NTIS MF A01; 2; GPO Dep. File Number DE87005493.

Fractographic examination has been performed on selected Charpy specimens of manganese stabilized martensitic stainless steels in order to identify the cause of irradiation embrittlement. Embrittlement was found to be partly due to enhanced failure at grain boundaries arising from precipitation. Microstructural examination of a specimen irradiated at higher temperature has demonstrated the presence of Fe-Cr-Mn chi phase, a body centered cubic intermetallic phase known to cause embrittlement. This work indicated that manganese stabilized martensitic stainless steels are prone to intermetallic phase formation which is detrimental to mechanical properties.

16277 **(HEDL-SA—3280-FP) Ion-induced spinodal-like decomposition of Fe-Ni-Cr Invar alloys.** Garner, F.A.; Brager, H.R.; Dodd, R.A.; Lauritzen, T. (Hanford Engineering Development Lab., Richland, WA (USA); Wisconsin Univ., Madison (USA); General Electric Co., Sunnyvale, CA (USA)). Dec 1985. Contract AC06-76FF02170. 22p. (CONF-8510160—21). NTIS, PC A02/MF A01. File Number DE87004091.

From ASM metals congress/TMS-AIME fall meeting; Toronto, Ontario, Canada (13 Oct 1985).

It was recently discovered that Fe-Cr-Ni alloys with 35 +- 10 wt.% nickel decompose in a spinodal-like manner when irradiated with fast neutrons. This unexpected decomposition has many consequences. Not only do the anomalous properties characteristic of the Invar compositional regime disappear, but pronounced changes occur in both tensile properties and void swelling. Ion bombardment experiments have also been used to study void swelling and are now being used to study the decomposition. Microscopy and EDX examination of specimens employed in earlier void swelling studies confirm that ion irradiation induces spinodal-like decomposition in these alloys. The period and amplitude of the compositional fluctuations induced by irradiation are sensitive to temperature, nickel content and perhaps crystallographic direction, but are not very sensitive to chromium content or displacement rate.

16278 **(HEDL-SA—3319-FP) Fracture toughness of stainless steel welds.** Mills, W.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1985. Contract AC06-76FF02170. 40p. (CONF-8607107—1). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004085.

From 19. national symposium on fracture mechanics; San Antonio, TX, USA (1 Jul 1986).

The effects of temperature, composition and weld-process variations on the fracture toughness behavior for Types 308 and 16-8-2 stainless steel (SS) welds were examined using the multiple-specimen J/sub R/-curve procedure. Fracture characteristics were found to be dependent on temperature and weld process but not on filler material. Gas-tungsten-arc (GTA) welds exhibited the highest fracture toughness, a shielded metal-arc (SMA) weld exhibited an intermediate toughness and submerged-arc (SA) welds yielded the lowest toughness. Minimum-expected fracture properties were defined from lower-bound J/sub c/ and tearing modulus values generated here and in previous studies. Fractographic examination revealed that microvoid coalescence was the operative fracture mechanism for all welds. Second phase particles of manganese silicide were found to be detrimental to the ductile fracture behavior because they separated from the matrix during the initial stages of plastic straining. In SA welds, the high density of inclusions resulting from silicon pickup from the flux promoted premature dimple rupture. The weld produced by the SMA process contained substantially less manganese silicide, while GTA welds contained no silicide inclusions. Delta ferrite particles present in all welds were substantially more resistant to local failure than the silicide phase. In welds containing little or no manganese silicide, delta ferrite particles initiated microvoid coalescence but only after extensive plastic straining.

16279 **(INIS-SU—370, pp 44-48) To the theory of radiation-induced pores in crystals.** Mirzoev, F.Kh.; Fetisov, E.P.; Shelepin, L.A. 1984. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE87780078.

In Experimental and theoretical physics. Collection.

Mean time necessary for formation of a stable pore nucleus in an irradiated crystal oversaturated both by vacancies and interstitials is calculated. It is shown that interstitials affect essentially upon the process of stable pore generation increasing the mean time of their formation.

16280 **(JINR—E-14-85-284) Application of neutron time-of-flight diffraction to texture studies.** (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1985. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701332.

Submitted to workshop on experimental technique of texture analysis (Clausthal-Zellerfeld, FRG, March 25-29, 1985).

The application of neutron time-of-flight diffraction to texture investigation on polycrystalline solids is described. A composition with the stationary method shows the efficiency but also some disadvantages of the proposed technique. The texture diffractometer NSWR is described, which was going into operation at the pulsed reactor IBR-2. Selected experiments on metallic and geological specimens demonstrate the efficiency of neutron texture analysis using time-of-flight technique. 10 refs.; 10 figs.

16281 **(KFK—4137) Development of carbide sintering steels with high wear resistance.** Klausmann, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Maschinenbau). Oct 1986. 172p. (In German). NTIS (US Sales Only), PC A08/MF A01. File Number DE87751303.

In systems, in which the carbide forming elements also form the liquid phase, here investigated with Fe-Mo-C, the proportion of the liquid phase and thus the densification is only hard to control, due to a necessary carbide content of ≧10 vol.%. In addition the carbide precipitates as a grain boundary phase. When NbC or TiC is used as the hard phase, the liquid phase was initiated by addition of P or P-C. Thereby in the system Fe-NbC-P or Fe-NbC-P-C a good densification was achieved. Analogous experiments with TiC showed insufficient sintered density, since the wettability of Fe-P on TiC was poor. A finely dispersed distribution of the NbC-phase was reached with the mechanical alloying by attrition. To get a sufficient compactibility for the attrited powder, it had to be annealed and the large flaky particles where mechanically crushed in the mixer. It is advantageous, that the NbC-content can be increased up to 30 vol.%, without influencing the sintering parameters and the matrix, since the carbide does not have any influence on the liquid phase. Furthermore the desired matrix can be achieved by variing the C-content or heat treatment, without influencing the carbide phase. The determined mechanical properties show, that the Fe-NbC-P-C material can be manufactured to meet a wide range of demands for wear resistant components. Abrasion wear tests showed, that the here developed material has at least the same abrasion wear resistance as commercial wear resistant materials. (orig./IHOE).

16282 **(LA—10700-MS) Materials compatibility during the chlorination of molten $CaCl_2$. CaO salts.** Rense, C.E.C.; Fife, K.W.; Bowersox, D.F.; Ferran, M.D. (Los Alamos National Lab., NM (USA)). Jan 1987. Contract W-7405-ENG-36. 26p. NTIS, PC A03/MF A01; GPO Dep. File Number DE87004770.

As part of our effort to develop a semicontinuous PuO_2 reduction process, we are investigating promising materials for containing a 900°C molten $CaCl_2$. CaO chlorination reaction. We want the material to contain this reaction and to be reusable. We tested candidate materials in a simulated salt (no plutonium) using anhydrous HCl as the chlorinating agent. Data are presented on the performance of 36 metals and alloys, 9 ceramics, and 3 coatings.

16283 **(LA-UR—86-4347) The effect of the cube texture component on the earing behavior of rolled f.c.c. metals.** Rollett, A.D.; Canova, G.R.; Kocks, U.F. (Los Alamos National Lab., NM (USA); Metz Univ., 57 (France). Faculte des Sciences). 1986. Contract W-7405-ENG-36. 11p. (CONF-861076—4). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003757.

From Fall meeting of the Metallurgical Society of AIME; Orlando, FL, USA (5 Oct 1986).

An application of texture simulation to the formability of rolled f.c.c. sheet is described. Control of the earing behavior of such sheet is crucial to the efficient utilization of material. Cold-rolled f.c.c. metals characteristically give ears at 45° to the rolling direction but it is known that if a large cube component is present before the material is rolled, the severity of the earing is reduced. The cube component, (010)[001], by itself is known to give ears at 90° to the rolling direction and could thus balance a 45° earing tendency. The cube component is unstable to rolling deformation, however, and is generally not observed in heavily cold-rolled f.c.c. metals. Therefore, the challenge is to explain how a large cube component, present prior to rolling, can affect the earing behavior at large rolling reductions. Texture simulation shows that orientations near cube tend to rotate primarily about the rolling direction towards the Goss orientation, (110)[001]. It has been established both experimentally and theoretically that all orientations between the cube and the Goss positions give 90° ears. Therefore, the effect of a prior cube component is due to the special behavior of orientations near cube under rolling deformation.

16284 **(LA-UR—87-15) Normal state magnetic behavior of (U/sub 1-x/RE/sub x/)Be_{13} pseudobinaries.** Zirngiebl, E.; Thompson, J.D.; Smith, J.L.; Fisk, Z. (Los Alamos National Lab., NM (USA)). 1987. Contract W-7405-ENG-36. 5p. (CONF-870142—3). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005126.

From 5. international conference on valence fluctuations; Bangalore, India (5 Jan 1987).

Any impurity doping seems to modify the low temperature properties of UBe_{13} in a way rather unusual compared to normal superconductors. So far, however, little attention has been paid to the modification of the normal state properties of impurity doped UB_{13}. We have investigated the normal state magnetic behavior of impurity doped (U/sub 1-x/RE/sub x/)Be_{13} pseudobinaries (RE = Th, Y, La, Lu, Sc) in the temperature range between 2 K and 380 K for impurity concentrations $x \leqq 0.05$ to see if there are correlations with T/sub c/(x).

16285 **(LA-UR—87-16) Low temperature properties of $CeCu_5$ and related compounds.** Willis, J.O.; Aiken, R.H.; Fisk, Z.; Zirngiebl, E.; Thompson, J.D.; Ott, H.R.; Batlogg, B. (Los Alamos National Lab., NM (USA); Eidgenoessische Technische Hochschule, Zurich (Switzerland); Bell Labs., Murray Hill, NJ (USA)). 1987. Contract W-7405-ENG-36. 8p. (CONF-870142—4). NTIS, PC A02/MF A01; GPO Dep. File Number DE87005125.

From 5. international conference on valence fluctuations; Bangalore, India (5 Jan 1987).

Magnetic susceptibility, specific heat, and thermal expansion of $CeCu_5$ indicate two phase transitions. Measurements on $CeAlCu_4$, $CeAl_2Cu_3$, $CeZn_2Cu_3$, and $CeAlZn_2Cu_3$ are also reported. (DLC)

16286 **(LYCEN—8445) Temperature influence during nitrogen implantation into steel.** Moncoffre, N.; Hollinger, G.; Jaffrezic, H.; Marest, G.; Tousset, J. (Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire). Jul 1984. 9p. (CONF-840760—22). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750581.

From Ion beam modification of materials conference; Ithaca, NY, USA (16 Jul 1984).

Nitrogen ion implantations in a XC06 steel are performed at different temperatures. The nitrogen profiles are measured using the narrow 429 keV resonance of the $^{15}N(p,\alpha\gamma)^{12}C$ nuclear reaction. The iron and nitrogen chemical states are determined by Conversion Electron Moessbauer Spectroscopy (CEMS). The chemical composition of the implanted layer is also studied by means of X-ray Photoelectron Spectroscopy (XPS). A strong variation of the nitrogen profiles is shown at temperatures between 20 and 200°C. This temperature effect differs from that of post annealings. The formation of a superficial peak due to epsilon-carbonitride phases increasing with temperature is observed for implantations performed from 100°C. An evolution of iron nitride and carbonitride phases is observed as a function of implantation temperature.

16287 **(N—87-11873) Grain boundary oxidation and fatigue crack growth at elevated temperatures. Final report.** Liu, H.W.; Oshida, Y. (Syracuse Univ., NY (USA)). Oct 1986. 30p. (NASA-CR—179529; NAS—1.26:179529). NTIS, PC A03/MF A01.

Fatigue crack growth rate at elevated temperatures can be accelerated by grain boundary oxidation. Grain boundary oxidation kinetics and the statistical distribution of grain boundary oxide penetration depth were studied. At a constant delta K-level and at a constant test temperature, fatigue crack growth rate, da/dN, is a function of cyclic frequency, nu. A fatigue crack growth model of intermittent micro-ruptures of grain boundary oxide is constructed. The model is consistent with the experimental observations that, in the low frequency region, da/dN is inversely proportional to nu, and fatigue crack growth is intergranular.

16288 **(N—87-11875) Primary arm spacing in chill block melt spun Ni-Mo alloys.** Tewari, S.N.; Glasgow, T.K. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1986. 21p. (NASA-TM—88887; E—3297; NAS—1.15:88887; CONF-861063—3). NTIS, PC A02/MF A01.

From American Society of Metals materials week; Lake Buena Vista, FL, USA (6 Oct 1986).

Chill block melt spun ribbons of Ni-Mo binary alloys containing 8.0 to 41.8 wt % Mo have been prepared under carefully controlled processing conditions. The growth velocity has been determined as a function of distance from the quench surface from the observed ribbon thickness dependence on the melt puddle residence time. Primary arm spacings measured at the midribbon thickness locations show a dependence on growth velocity and alloy composition which is expected from dendritic growth models for binary alloys directionally solidified in a positive temperature gradient.

16289 **(N—87-11889) Mechanical properties of various alloys in hydrogen. Final report.** Weeks, N.L.; Mucci, J. (United Technologies Corp., East Hartford, CT (USA)). Jun 1986. 30p. (NASA-CR—178874; NAS—1.26:178874; FR—19269). NTIS, PC A03/MF A01.

Notch tensile tests were conducted to determine the tensile strength of experimental alloys proposed for use in a pressurized gaseous hydrogen environment. The experimental alloys were processed and supplied by the Marshall Space Flight Center. They were supplied in four groups: nickel-base alloys, iron-base alloys, beryllium alloys, and the single-crystal alloy PWA 1480 in seven crystallographic orientations. Testing of the nickel-base, iron-base, and beryllium alloys established the comparative ambient temperature notch tensile strength in 34.5 MPa (5000 psig) gaseous hydrogen environment. After the test results were documented and reported, the test specimens were returned for evaluation. Testing of the single-crystal alloy, PWA 1480, established the notched tensile strength for the various crystallographic orientations in 34.5 MPa (5000 psig) gaseous helium and hydrogen environments at 871 C (1600 F). Strengths established in hydrogen were compared to those in helium to determine environmental degradation due to hydrogen. For the nickel-base alloys, iron-base alloys, and the beryllium alloys, environmental degradation could not be established as no helium environment tests were conducted.

16290 (N—87-12357) Simulation studies for surfaces and materials strength. Semiannual report, 1 May-31 October 1986. Halicioglu, T. (Eloret Corp., Sunnyvale, CA (USA)). Oct 1986. 6p. (NASA-CR—177046; NAS—1.26:177046). NTIS, PC A02/MF A01.

During this reporting period three investigations were carried out. The first area of research concerned the analysis of the structure-energy relationship in small clusters. This study is very closely related to the improvement of the potential energy functions which are suitable and simple enough to be used in atomistic simulation studies. Parameters obtained from ab initio calculations for dimers and trimers of Al were used to estimate energetics and global minimum energy structures of clusters continuing up to 15 Al atoms. The second research topic addressed modeling of the collision process for atoms impinging on surfaces. In this simulation study qualitative aspects of the O atom collision with a graphite surface were analyzed. Four different O/graphite systems were considered and the aftermath of the impact was analyzed. The final area of investigation was related to the simulation of thin amorphous Si films on crystalline Si substrates. Parameters obtained in an earlier study were used to model an exposed amorphous Si surface and an a-Si/c-Si interface. Structural details for various film thicknesses were investigated at an atomistic level.

16291 (ND-R—1224(R)) Elastic-plastic finite element analysis of a rotating cylinder containing an internal, axial crack. Sharples, J.K. (UKAEA Risley Nuclear Power Development Labs.). Jul 1985. 45p. UKAEA (Northern Division), Risley, Warrington WA3 6AT. File Number TI87900473.

Work performed under United States-UKAEA Fast Reactor Exchange Program.

A large rotating cylinder rig has been proposed by the UKAEA to investigate the fracture of heavy section steel under mechanical and thermal loads, and a small scale prototype has been built to demonstrate its feasibility. Elastic-plastic finite element analyses have been carried out of the prototype rotating cylinder (containing a full length axial crack along the bore) in order to establish the extent of yielding in the cylinder with increasing rotational speed. Both the BERSAFE and ABAQUS finite element computer codes have been utilized for the assessment, and in the case of the former, values of J and the modified integral J* have been evaluated. The stress-strain relationship was idealized as elastic-perfectly plastic. The main conclusions are that for an internal axial crack extending half way through the wall of the cylinder (a/w = 0.5), the cracked ligament will yield at a rotational speed of between 5893 and 6690 rpm, and that the cylinder will become fully plastic at approximately 8000 rpm. These values compare favorably with those evaluated from calculation methods previously proposed. The validity of the earlier calculational methods has also been demonstrated for crack lengths (a/w) of 0.4 and 0.55 considered in the investigation. By assuming a fracture toughness (K/sub IC/) value of 200 MPa $\sqrt{m}$ for the material the results from the J and J* integral solutions indicate that crack growth may result from the a/w = 0.5 crack at rotational speeds exceeding 6000 rpm.

16292 (NIIAR—19(665)) Technique and preliminary results for in-reactor investigation of corrosion and mechanical behaviour of zirconium alloys under non-isothermal conditions. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 13p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701341.

Technique for investigation of corrosion resistance of zirconium alloys in the overheated water steam environment in the channel of experimental reactor is proposed. The device developed permits to irradiate samples at 300-1000 deg C. Preliminary results of investigation of corrosion resistance of zirconium alloys doped with Nb, Fe, Cr, W are presented to ground the technique possibilities. Some advantage of intermetallic type alloys under the conditions of short-time overheatings up to 1000 deg C is established. Statistical confirmation of the given fact is required. 5 refs.; 6 figs.; 1 tab.

16293 (ORNL/M—294) Soft x-ray emission studies of several aluminum alloys. Tsang, K.L.; Zhang, C.H.; Callcott, T.A.; Arakawa, E.T.; Ederer, D.L.; Biancaniello, F.; Curelaru, I. (Tennessee Univ., Knoxville (USA). Dept. of Physics; Oak Ridge National Lab., TN (USA); National Bureau of Standards, Washington, DC (USA); Utah Univ., Salt Lake City (USA). Dept. of Physics). 23 Sep 1986. Contract AC05-84OR21400. 2p. NTIS, PC A02. File Number DE87005232.

During the first few months of operation of our soft x-ray spectrometer at the NSLS, we have measured the L emission spectrum for three classes of aluminum alloys: dilute aluminum-magnesium alloys to extend the Al-Mg system to the impurity limit; a 50-50 alloy of aluminum-lithium to characterize the band structure of bulk samples of this potential battery electrolite; and the icosahedral and normal Al-Mn alloys to see if the two phases had measurably different density of states which have been predicted. All spectra shown are produced when core holes generated by energetic electrons or photons are filled by radiative transitions from conduction band states. Dipole selection rules govern the transitions. Thus, K spectra provide a measure of the p-symmetic partial density of states (DOS) near the atom. Similarly, L spectra produced by transitions to p-core holes map the s and d symmetric DOS in the vicinity of the atom with the core hole.

16294 (PNL-SA—14033) XPS [x-ray photoelectron spectroscopy], AES [Auger electron spectroscopy], RBS [Rutherford backscattering spectroscopy], NRA [nuclear reaction analysis] and laser Raman studies of high temperature corrosion. Baer, D.R.; Dake, L.S. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1987. Contract AC06-76RL01830. 33p. (CONF-861063—2). NTIS, PC A03. File Number DE87004919.

From American Society of Metals materials week; Lake Buena Vista, FL, USA (6 Oct 1986).

This paper describes the basic principles of five surface and near surface analysis methods and explores ways they can be used to gather information relevant to oxidation and high temperature corrosion. The techniques discussed include: Auger electron spectroscopy, x-ray photoelectron spectroscopy, Rutherford backscattering spectroscopy, nuclear reaction analysis and laser Raman spectroscopy. Advantages and limitations of each method are highlighted. To illustrate the types of information available, four of the techniques have been used to examine the oxide formed on a nickel-chromium-thoria alloy. Other examples, original and from the literature, are used to demonstrate special characteristics of the techniques. Particular attention is devoted to the possibilities and limitations of high temperature studies in ultra high vacuum analytical systems.

16295 (RFP—4060) Inertia friction welding of 1100 aluminum to type 316 stainless steel. Yashan, D.; Tsang, S.; Johns, W.L.; Doughty, M.W. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant; Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA)). 1986. Contract AC04-76DP03533. 38p. (CONF-8604123—3). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005044.

From 67. annual American Welding Society meeting; Atlanta, GA, USA (13 Apr 1986).

Joining 1100 aluminum to type 316 stainless steel by inertia friction welding was investigated. Weld quality was evaluated using a tensile specimen configuration designed to promote failure at the weld interface rather than in the aluminum base metal. Results from this work showed that good quality welds can be obtained within certain ranges of axial pressure (heating plus forge pressures), and specific energy, which is a function of flywheel moment of inertia, rotational speed, and total weld area. The use of a high specific energy led to the formation of a brittle intermetallic compound at the interface, resulting in a loss of weld strength. Three steel faying surface geometry variations were evaluated; they were found to only have a minor effect on strength. Comparisons of strength and hardness values between the inner and outer portions of the weld area revealed a variation in weld quality across the interface in most cases.

16296 **(SAND—86-2814C) Passivity of amorphous Ni-Cr-P alloys.** Diegle, R.B.; Clayton, C.R.; Helfand, M.; Sorensen, N.R. (Sandia National Labs., Albuquerque, NM (USA); State Univ. of New York, Stony Brook (USA)). 1987. Contract AC04-76DP00789. 4p. (CONF-870314—5). NTIS, PC A02/MF A01. File Number DE87003155.

From Corrosion '87; San Francisco, CA, USA (9 Mar 1987).

Addition of Cr to Ni-20P at levels of 3 and 10 at.% enhances passivation in 0.2N HCl. XPS shows no evidence of oxidized Ni species, suggesting that the passivating film contains Cr_2O_3, $Cr(OH)_3^-$, and minor quantities of Cr^{6+} ion. P is present on the surface as H_3PO_3, PO_4^{-3}, and H_2PO_2. The existence of $H_2PO_3^-$ indicates that the barrier film may be responsible for the presence of this ionic species, such as reducing the concentration of water available at the metal-film interface.

16297 **(SAND—86-2856C) Passivation of P-implanted Fe-Cr amorphous alloys.** Sorensen, N.R.; Diegle, R.B.; Picraux, S.T. (Sandia National Labs., Albuquerque, NM (USA)). 1987. Contract AC04-76DP00789. 2p. (CONF-870314—7). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003788.

From Corrosion '87; San Francisco, CA, USA (9 Mar 1987).

Passivation of implanted (100 keV P) and unimplanted Fe-Cr alloys in 0.1N H_2SO_4 with 0-500 ppM NaCl was studied. It was found that Cr and P interact to promote passivity. Increasing the Cr concentration from 6 to 8% changes the corrosion behavior, 10% Cr improves further the passivation. The effects of structure on the corrosion resistance of Fe-Cr were also studied.

16298 **(UCRL—53753) Electroforming with nickel, iron, and aluminum.** Lakner, J.F. (Lawrence Livermore National Lab., CA (USA)). 15 Jul 1986. Contract W-7405-ENG-48. 76p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87005589.

This is a manual of practical operating instructions for electroforming with the Watts-type nickel, iron, and aluminum baths. Collected here, in one volume, are many of the supposedly "secret" principles used by different manufacturers of electroformed parts. The author details the methods used to produce several types of electroformed shapes with lengths up to 30 in. and diameters as large as 8 in. In this illustrated manual, the author describes the apparatus; outlines the physical properties of electroplating baths and step-by step plating operations; provides analyses of electroformed products; addresses the difficulties encountered in the electrolysis process; describes mandrel design; and defines the machining and grinding techniques used. The author also describes how to produce "steel" shapes from iron that has first been electroformed and then carburized on a TiC mandrel.

16299 **(UCRL—94386) Laser welding metallography.** Ferreira, J.L. (Lawrence Livermore National Lab., CA (USA)). 1986. Contract W-7405-ENG-48. 16p. (CONF-8608153—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004113.

From International Metallographic Society conference on microstructural science; Boston, MA, USA (3 Aug 1986).

The metallographic preparation of weld samples becomes an absolute necessity when laser welding ultra-small parts as small diameter thin wall tubing or postage stamp-size and smaller machined components. In such welding situations, only a metallographic cross section of the weld can show the amount of penetration and the configuration of the weld nugget in relation to the weld joint. Further, metallographic examination can show cracking and porosity in the weld nugget which is generally too small for detection by conventional x-raying techniques. The speed at which weld parameters can be ascertained is also of considerable value when a test part is made and the laser is held on simmer awaiting results. This paper deals with sample preparation of various fine components that have laser welded and will discusss techniques for obtaining the most information from a sample weld.

16300 **Pt-Ti alloy formation from high-temperature reduction of a titania-impregnated Pt catalyst: implications for strong metal-support interaction.** Beard, B.C.; Ross, P.N. (Lawrence Berkeley Lab., CA). *Journal of Physical Chemistry;* **90**: No. 26, 6811-6817(18 Dec 1986). Contract AC03-76SF00098.

Highly dispersed Pt supported on carbon black was impregnated with titania and heated in an inert atmosphere. The amount of titania used was twice the stoichiometric amount required for the formation of the ordered alloy phase Pt_3Ti. The chemical state of Ti at various stages of heating was determined by X-ray photoelectron spectroscopy and by extended X-ray absorption fine structure (EXAFS) analysis. The formation of alloy phases could also be determined by conventional X-ray diffraction methods. The characterizations showed unambiguously the conversion of separate Pt and TiO_2 dispersed phases into Pt-Ti alloy phases at progressively higher heat treatment temperatures, eventually resulting in the formation of crystallites of the ordered (intermetallic) phase Pt_3Ti. On the basis of this observation and other related work in the literature, they present a model for the chemistry occurring during the formation of the SMSI state of Pt/TiO_2 catalysts.

16301 **Crystal structure stability and fission gas swelling in intermetallic uranium compounds.** Hofman, G.L. (Argonne National Lab., IL, USA). *Journal of Nuclear Materials;* **140**: No. 3, 256-263(Oct 1986). Contract W-31-109-ENG-38.

A correlation between fission-induced amorphization and the behavior of fission gases in intermetallic uranium compounds is proposed. Changes in fission-gas mobility and in the plastic flow rate of the fuel, that result from such a transformation, are likely to be responsible for the large fission-gas-driven swelling-rate increases that have been observed in certain fuels. This study attempts to assess the propensity for amorphization of intermetallic compounds as potential test-reactor fuels by means of their thermodynamic properties. The compound U/sub 6/Mn was thus identified as a probable candidate for a stable high-density intermetallic fuel to be used in dispersion-fuel elements.

16302 **Trapping of deuterium in argon-implanted nickel.** Frank, R.C.; Rehn, L.E.; Baldo, P. (Augustana College, Rock Island, IL). *Journal of Applied Physics;* **57**: No. 3, 845-848(1 Feb 1985).

Argon ions with energy 250 keV were implanted at fluences of 2×10^{16} cm^{-2} at temperatures of 500, 250, and 21°C, in the specimen of relatively pure polycrystalline nickel. Deuterium was introduced into the surface and implanted regions by making the specimen the negative electrode of an electrolytic cell containing 1-N pure deuterated sulfuric acid. Deuterium trapped in the vacancy complexes of the implanted regions was analyzed as a function of temperature using the vacancy complexes of the implanted regions was analyzed as a function of temperature using the $^2H(^3He, ^1H)^4He$ nuclear reaction during an isochronal annealing process. The results indicate that the types of traps and trap densities found in the regions implanted at 21 and 250°C were essentially identical while the trap density found in the region implanted at 500°C was approximately 40% of that found in the other regions. Math model comparison with the experimental results suggests the existence of at least two types of traps in each region. Trap binding enthalpies used in the math model to fit the experimental data were slightly higher for the region implanted with argon at 500°C than for the regions implanted at the lower temperatures. TEM studies revealed the presence of small voids in the region implanted at 500° as well as dislocation loops similar to those found in the regions implanted at the lower temperatures. 20 references, 2 figures.

16303 **Valence instabilities in amorphous rare earth compound films.** Croft, M.; Lu, F.; Melczer, M.E.; Zolandz, A.; Hall, G.; Spencer, E.G. (Rutgers Univ., Piscataway, NJ). *Journal of Magnetism and Magnetic Materials;* **47**: No. 48, 1-3(1985). Contract AS05-82ER12061.

The amorphous film analogs of several well-known crystalline mixed valent compounds ($CePd_3$, $CeAl_3$ and Ce(Cu/sub 1-x/Ni/sub x/)/sub y/ with y = 5) have been prepared by sputter deposition onto cryogenic substrates using intermetallic targets. The

authors will discuss characterization of the films with: X-ray diffraction, for short and long term amorphousness; L/sub III/ absorption spectroscopy, for Ce valence state; PIXE and X-ray absorption, for composition estimation; and temperature-dependent resistivity, to probe Kondo type spin fluctuations. 11 references, 4 figures.

16304 **Small angle X-ray scattering (SAXS) study of coarsening kinetics in an aluminum-lithium alloy.** Spooner, S. (Oak Ridge National Lab., TN). *Materials Research Society Symposia Proceedings;* **41**: 89-94(1985). Contract AC05-84OR21400.

Coarsening kinetics was studied in a Al/sub 90.6/Li/sub 9.14/ alloy aged at 100°C, 128°C, 165°C, 178°C, and 209°C. The time-dependent behavior of the average precipitate radius followed t/sup 1/3/ behavior. The precipitate/matrix interfacial energy obtained from analysis of the kinetic constant was 0.015 J/M² and was largely independent of temperature. The scattering curves exhibit interparticle interference which prevents calculating a particle size distribution. 12 references, 3 figures, 3 tables.

16305 **Thermal annealing of vacancy and interstitial loops in ion irradiated copper.** Larson, B.C.; Noggle, T.S.; Barhorst, J.F. (Oak Ridge National Lab., TN). *Materials Research Society Symposia Proceedings;* **41**: 25-30(1985). Contract AC05-84OR21400.

X-ray diffuse scattering has been used to study the thermal annealing of vacancy and interstitial loops in Ni-ion irradiated copper. The diffuse scattering formalism is reviewed and diffuse scattering measurements are reported on liquid-He temperature Ni-ion irradiated copper after annealing to 40, 275, and 300°C. Size distributions are presented for vacancy and interstitial loops after each anneal and the thermal-induced changes are discussed in terms of loop dissolution and coalescence. 13 references, 4 figures, 1 table.

16306 **Time-resolved x-ray studies during pulsed-laser irradiation of Ge.** Tischler, J.Z.; Larson, B.C.; Mills, D.M. (Oak Ridge National Lab., TN). *Materials Research Society Symposia Proceedings;* **35**: 119-124(1985). Contract AC05-84OR21400.

Synchrotron x-ray pulses from the Cornell High Energy Synchrotron Source (CHESS) have been used to carry out nanosecond resolution measurements of the temperature distributions in Ge during UV pulsed-laser irradiation. KrF (249 nm) laser pulses of 25 ns FWHM with an energy density of 0.6 J/cm² were used. The temperatures were determined from x-ray Bragg profile measurements of thermal expansion induced strain on <111> oriented Ge. The data indicate the presence of a liquid-solid interface near the melting point, and large (1500-4500°C/μm) temperature gradients in the solid; these Ge results are analogous to previous ones for Si. The measured temperature distributions are compared with those obtained from heat flow calculations, equilibrium melting point are discussed. 6 references, 3 figures.

16307 **A study of the equilibrium vacancy ensemble in aluminum using 1D- and 2D-angular correlation of annihilation radiation.** Fluss, M.J.; Berko, S.; Chakraborty, B.; Hoffmann, K.R.; Lippel, P.; Siegel, R.W. (Materials Science and Technology Div., Argonne National Lab., Argonne, IL 60439). pp 257-259 of Positron annihilation. Jain, P.C.; Singru, R.M.; Gopinathan, K.P. Philadelphia, PA; World Scientific Pub. Co. (1985). (CONF-850169—).

From 7. international conference on positron annihilation; New Delhi, India (6 Jan 1985).

One- and two-dimensional angular correlation of positron-electron annihilation radiation (1D and 2D-ACAR) data have been obtained between 293 and 903 K for single crystals of aluminum. The peak counting rates vs temperature, which were measured using the 1D-ACAR technique, provide a model independent value for the temperature dependence of the positron trapping probability. Using these results it is possible to strip out the Bloch state contribution from the observed 2D-ACAR surfaces and then compare the resulting defect ACAR surfaces to calculated 2D-ACAR surfaces for positrons annihilating from the Bloch, monovacancy, and divacancy-trapped states. The results of this comparison is that the presence of an increasing equilibrium divacancy population is consistent with the observed temperature dependence of ACAR data at high temperature in Al and that the present results when compared to earlier studies in Al indicate that the ratio of the trapping rates at divacancies and monovacancies is of order two.

16308 **Vacancies in thermal equilibrium in Nb.** Nielsen, B.; Lynn, K.G.; Hurst, J.; Vehanen, A.; Schultz, P.J. (Brookhaven National Lab., Upton, NY). pp 464-465 of Positron annihilation. Jain, P.C.; Singru, R.M.; Gopinathan, K.P. Philadelphia, PA; World Scientific Pub. Co. (1985). (CONF-850169—).

From 7. international conference on positron annihilation; New Delhi, India (6 Jan 1985).

The authors have measured the diffusion of positrons in Nb(110) in the temperature range from 300K to 2450K utilizing a variable energy positron beam. The purpose was to study the vacancy formation. However, no significant sign of vacancy trapping was observed. This could be due to a high detrapping rate caused by a low positron binding energy or due to a high vacancy formation enthalpy H/sub IV//sup F/. The last possibility is consistent with recent studies of the vacancy migration and with calculation of the positron binding energy. In this case the authors find the H/sub IV//sup F/ > 3 eV.

16309 **A positron annihilation doppler broadening study of niobium.** Smedskjaer, L.C.; Loper, G.D.; Chason, M.K.; Gerber, S.B.; Siegel, R.W. (Materials Science & Technology Div., Argonne National Lab., Argonne, IL 60439). pp 546-548 of Positron annihilation. Jain, P.C.; Singru, R.M.; Gopinathan, K.P. Philadelphia, PA; World Scientific Pub. Co. (1985). (CONF-850169—).

From 7. international conference on positron annihilation; New Delhi, India (6 Jan 1985).

Doppler broadening of the positron annihilation lineshape has been measured for 99.995 wt. % pure niobium in the temperature range 300-2581 K. It was found that the effect of the equilibrium vacancies upon the Doppler-broadened lineshape in pure niobium is much smaller than that normally found for other metals, in agreement with an earlier study. Furthermore, the addition of 100 at. ppm oxygen to the niobium produced no measureable effects on the lineshape, within the experimental uncertainties, either within or below the vacancy-sensitive temperature region. The results are discussed in relation to previous investigations of positron trapping at vacancies in niobium, as well as to studies of vacancy migration in metals.

16310 **PAS determination of the vacancy formation enthalpy in tungsten.** Smedskjaer, L.C.; Chason, M.K.; Siegel, R.W. (Materials Science & Technology Div., Argonne National Lab., Argonne, IL 60439). pp 549-551 of Positron annihilation. Jain, P.C.; Singru, R.M.; Gopinathan, K.P. Philadelphia, PA; World Scientific Pub. Co. (1985). (CONF-850169—).

From 7. international conference on positron annihilation; New Delhi, India (6 Jan 1985).

A measurement of the vacancy formation enthalpy in 99.999 wt. % pure tungsten under thermal equilibrium conditions was made using the positron annihilation spectroscopy (PAS) Doppler-broadening technique. Temperatures were measured by optical pyrometry, with calibrations against a W(Re) thermocouple, the tantalum melting point, and the power delivered to the sample. A trapping-model analysis of the PAS data from the temperature range 300-3633 K yielded a vacancy formation enthalpy of 3.76 +- 0.39 eV. Comparisons are made between the present result and the other available results on vacancy formation in tungsten.

16311 **Methane-bubble formation in hydrogen-charged Fe-30 ppm C.** Snead, C.L. Jr.; Lynn, K.G.; Suenaga, M. (Brookhaven National Lab., Upton, NY 11973). pp 552-554 of Positron annihilation. Jain, P.C.; Singru, R.M.; Gopinathan, K.P. Philadelphia, PA; World Scientific Pub. Co. (1985). (CONF-850169—).

From 7. international conference on positron annihilation; New Delhi, India (6 Jan 1985).

The authors have used positrons as a probe of the early-stage growth of methane bubbles in hydrogen-charged polycrystal-

line Fe. Ferrovac E (30 ppm C) was charged at 900 psi of H/sub 2/ at 475°C for various times to generate the methane internally. It is known that this process generates methane bubbles. The results show that, even at very early bubble-growth stages, dislocations are generated. A lifetime definitely associated with trapping at bubbles is not observed, due either to trapping by dislocations that are generated and which can "screen" the bubbles, or be passivation of the bubbles as positron traps by the presence of hydrogen or methane in them.

16312 **High intensity positron beam and angular correlation experiments at Livermore.** Howell, R.H.; Fluss, M.J.; Rosenberg, I.J.; Meyer, P. (Lawrence Livermore National Lab., Livermore, CA). pp 801-803 of Positron annihilation. Jain, P.C.; Singru, R.M.; Gopinathan, K.P. Philadelphia, PA; World Scientific Pub. Co. (1985). (CONF-850169—).

From 7. international conference on positron annihilation; New Delhi, India (6 Jan 1985).

A positron beam apparatus that produces a variable energy positron beam with sufficient intensity to perform new positron experiments in an ultrahigh vacuum environment has been installed at the Lawrence Livermore 100 MeV electron linac. The authors have installed two large area position sensitive gamma-ray detectors to measure angular correlations in two dimensions and a separate highly collimated detector to measure positronium energy distributions by time-of-flight velocity determination. Data from measurements on single crystals of Cu are described.

16313 **Magnetization density of 5 f electrons in ferromagnetic PuSb.** Lander, G.H.; Delapalme, A.; Brown, P.J.; Spirlet, J.C.; Rebizant, J.; Vogt, O. (Argonne National Lab., IL). *Physical Review Letters;* **53**: No. 23, 2262-2265(3 Dec 1984).

The magnetization density of 5 f electrons in PuSb has been measured by use of a single crystal and polarized neutrons. The spatial extent of the spin and orbital densities is such that the form factor has a maximum at sin theta/$\lambda \sim 0.2$ A^{-1}. The ground-state wave function is deduced. Evidence for anisotropic interactions is presented. 14 references, 3 figures.

16314 **Effects of d-integral correlation on the mixed-valence properties of cerium systems: the integral-band problem.** Liu, S.H.; Ho, K.M. (Oak Ridge National Lab., IL). *Physical Review [Section] B: Condensed Matter;* **30**: No. 6, 3039-3046(15 Sep 1984). Contract AC05-84OR21400.

The d-integral correlation model, proposed by Liu and Ho to explain the double-peak photoemission spectrum of Ce, has been used to examine the integral-band problem in Ce-based mixed-valence materials. The problem is solved in the spinless approximation and under the assumption that the integral-level occupancy is nearly 1 on every Ce site. Two sets of d-integral hybridized bands, corresponding to the two screening states of integral^0 sites, have been found, and each set has two branches. At zero temperature, the upper branch of the upper set of bands has real energies, while all three other branches have complex energies. At finite temperatures, the quasiparticles in the upper branch also acquire a finite level width. This effect gives rise to a d-integral interaction contribution to the electrical resistivity whose temperature dependence satisfies a simple scaling relation. 15 references, 3 figures.

16315 **Adsorption of Ag on Ge(100)-(2 x 1).** Miller, T.; Rosenwinkel, E.; Chiang, T.C. (Univ. of Illinois at Urbana-Champaign). *Solid State Communications;* **50**: No. 4, 327-330(1984). Contract AC02-76ER01198.

The initial stages of interface formation of Ag deposited onto Ge(100)-(2 x 1) were studied with high-energy electron diffraction and high-resolution photoemission. The surface core-level energies for clean Ge(100)-(2 x 1) were not changed with the deposition of about one monolayer of Ag, indicating that there was no chemical reaction or atomic intermixing. The Ag nucleated at a coverage of about 1/3 monolayer and showed three-dimensional growth for higher coverages. 13 references, 3 figures.

16316 **Dose dependence of ion beam mixing of Au on amorphous and single crystalline Si and Ge.** Poker, D.B.; Holland, O.W.; Appleton, B.R. (Oak Ridge National Lab., TN). *Materials Research Society Symposia Proceedings;* **27**: 73-78(1984). Contract W-7405-ENG-26.

The rate of ion induced mixing of 700 A Au layers vapor deposited on amorphous and single crystalline Si substrates held at room temperature was measured as a function of dose using 300 keV Si, 350 keV Ar, and 525 keV Kr ion beams. Mixing profiles were measured at various fluences by Rutherford backscattering techniques and were found to be consistent with mixed layers whose thickness increased with ion dose. Mixing compositions, which were stoichiometric over the entire mixed region at Au-28.5 at. % Si, were found to be independent of ion species or implant fluence. For all ion species the dose dependence of mixing was closer to linear than the square root power law reported previously. In addition, the mixing rate for Au on single crystalline substrates was significantly higher than Au on substrates amorphized by Si (self-ion) implantation at liquid nitrogen temperature. No difference was found between the mixing rates when the amorphous substrates were prepared by room temperature implantation. Preliminary results indicate similar behavior for the Au/Ge couple. 4 figures, 17 references.

16317 **Surface modification of solids.** Appleton, B.R. (Oak Ridge National Lab., Oak Ridge, TN). pp 363-373 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—). Contract AC05-84OR21400.

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

The examples presented here merely suggest the potential of ion beam and laser processing for both fundamental materials studies and practical applications. Many of the fundamental ion beam mixing mechanisms leading to new materials properties are not well understood and need more detailed study. For example it is not clear why Au/Ge and Au/Si form amorphous mixtures at the same compositions as the metastable phases which result on thermal annealing; or why, despite the similarity of phase diagrams for Pd/Si and Pt/Si, that Pt/Si forms metastable phases while Pd/Si does not. Although the Au/Ge eutectic systems undergo prolific ion beam mixing at all temperatures, Al/Ge, which is also a eutectic system, does not mix at all. For practical applications ion beam and laser processing are appropriate for virtually any material and for alteration of any surface related phenomenon. The added dimension of these processing methods are their nonequilibrium capabilities which can lead to new surface alterations. Their primary limitation is the near-surface (<10 μm) modification depths.

16318 **Superconducting materials.** Finnemore, D.K. (Ames Lab., Iowa State Univ., Ames, IA 50011). pp 385-389 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—).

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

There are many applications of superconducting magnets ranging from the high field axicell coils of a mirror machine to the large volume but low field magnets in magnetohydrodynamics application. The conditions of operation are sufficiently different that many different conductor materials are needed. No one conductor material is sufficiently versatile to cover the range of requirements on temperature, magnetic field, ac loss and strain tolerance. More different kinds of conductors need to be brought to commercial viability. In addition to the superconducting materials problems there is a need for high-strength, high thermal conductivity structural materials. The stresses in these large magnets approach the yield stress of stainless steel and more work is needed to develop these high strength materials. There is a broad need for more basic research in the synthesis of composites having dimensions in the 10 nm range and for more detailed microcharacterization of these surfaces and interfaces.

16319 **Advanced metal alloys for energy needs.** Morris, J.W. Jr. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA 94720). pp 329 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—). Contract AC03-76SF00098.

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

This paper briefly covers three areas in which the systematic design of new metal alloys promises to solve important technical problems. It does not treat a host of parallel developments that are equally important and exciting in such areas as high-temperature structural alloys, oxidation, corrosion, and wear-resistant alloys, high-strength structural alloys, magnetic alloys and films, and electrical conductors and superconductors. But the pattern of development in each of these areas is basically the same: the coupling of fundamental science and materials characterization to clarify the microstructural sources of important engineering properties, then the systematic manipulation of microstructure to create new alloys that satisfy important engineering needs.

16320 **Fundamental corrosion characterization of high-strength titanium alloys.** Schutz, R.W.; Grauman, J.S. (TIMET Div., Titanium Metals Corp. of America, P.O. Box 2128, Henderson, NV 89015). pp 130-142 of Industrial applications of titanium and zirconium: 4th volume. Young, C.S.; Durham, J.C. Philadelphia, PA; ASTM (1984). (CONF-841009—).

From 4. symposium on titanium and zirconium in industrial applications; Philadelphia, PA, USA (10 Oct 1984).

Many commercially available and several developmental high-strength titanium alloys were evaluated for application in chloride-containing environments with respect to general, crevice, and stress corrosion resistance. Studies in boiling reducing and oxidizing acid chloride media permitted identification of certain high-strength titanium alloys, containing ≧4 weight % molybdenum, which are significantly more resistant than unalloyed titanium with respect to general and crevice attack. Data regression analysis suggests that molybdenum and vanadium impart a significant positive effect on alloy corrosion resistance under reducing acid chloride conditions, whereas aluminum is detrimental. Little effect of metallurgical condition (that is, annealed versus aged) on corrosion behavior of the higher molybdenum-containing alloys was noted. No obvious susceptibility to chloride and sulfide stress corrosion cracking (SCC) was detected utilizing U-bend specimens at 177°C.

16321 **Plasma plume effects in pulsed carbon dioxide laser spot welding.** Arnot, R.S.; Albright, C.E. (Joining Model Lab. Div., Sandia National Labs., Livermore, CA 94550). pp 51-58 of Proceedings of the materials processing symposium. Volume 38. Metzbower, E.A. Toledo, OH; Laser Institute of America (1983). (CONF-831195—). Contract AC04-76DP00789.

From International congress on applications of lasers and electro-optics; Los Angeles, CA, USA (14 Nov 1983).

The effect of pulsed carbon dioxide laser spot welding variables on plasma plume formation in argon and helium, and resulting spot weld characteristics in AISI 1015 steel have been investigated. Two penetration modes were found to occur. At high peak power densities, and with the focal point held at the target surface, a vapor cavity penetration mode was observed. This was associated with a blue plasma plume which absorbed laser energy. At low peak power densities, or with the focal point above the target surface, a heat conduction penetration mode was observed. This mode was associated with a red vapor plume which did not significantly absorb laser energy. Both plume types were larger in argon than in helium. In addition, in argon at higher power densities, the blue plasma plume associated with the vapor cavity penetration mode can decouple from the target surface preventing further heat input.

16322 **Porosity decrease in laser welds of stainless steel using plasma control.** Estill, W.B.; Formisano, B.D. (Joining Model Lab. Div., Sandia National Labs., Livermore, CA 94550). pp 67-72 of Proceedings of the materials processing symposium. Volume 38. Metzbower, E.A. Toledo, OH; Laser Institute of America (1983). (CONF-831195—). Contract AC04-76DP00789.

From International congress on applications of lasers and electro-optics; Los Angeles, CA, USA (14 Nov 1983).

High energy laser welding incorporating plasma control has been studied and reported by numerous investigators. These investigators demonstrated significant increases in laser weld penetration by use of plasma control. In this report the authors show, in addition to variations in weld penetration, drastic decrease in porosity and variation in weld bead shapes resulting from laser welds incorporating plasma control. In particular, deep laser welds (greater than 6 mm) have been produced in 304L stainless steel that show no root porosity and only very few, if any, detectable micropores.

16323 **Angle-resolved photoemission extended fine structure.** Barton, J.J.; Bahr, C.C.; Hussain, Z.; Robey, S.W.; Klebanoff, L.E.; Shirley, D.A. (Materials and Molecular Research Div., Lawrence Berkeley Lab., and Departments of Chemistry and Physics, Univ. of California, Berkeley, CA 94720). pp 82-88 of Science with soft x-rays. Himpsel, F.J.; Klaffky, R.W. Bellingham, WA; SPIE Society of Photo-Optical Instrumentation Engineers (1983). (CONF-8310172—).

From Advances in soft x-ray science and technology conference; Upton, NY, USA (17 Oct 1983).

Core level angle-resolved photoemission intensity oscillates sinusoidally with increasing photoelectron momentum. Interference between direct and scattered photo-emission causes this angle-resolved photoemission extended fine structure (ARPEFS). The authors discuss an analytic single-scattering theory which quantitatively describes the oscillations. The procedures for extracting surface geometry information from photoemission measurements are illustrated with S(1s) ARPEFS from S on Ni(100) and Cu(100) obtained with the soft x-ray double crystal monochromator at the Stanford Synchrotron Radiation Laboratory. Buildings on the surface sensitivity and chemical selectivity of photoemission, ARPEFS analysis provides direct geometrical information from the oscillation frequencies (derived with auto-regressive Fourier analysis), from intensity changes with polarization and analyzer position, and from analysis of scattering phase-shift zero-crossings.

16324 **Performance of multilayer dispersion elements from 80 to 500 eV.** Bartlett, R.J.; Kania, D.R.; Trela, W.J.; Kallne, E.; Lee, P.; Spiller, E. (Los Alamos National Lab., Los Alamos, NM 87545). pp 23-26 of Science with soft x-rays. Himpsel, F.J.; Klaffky, R.W. Bellingham, WA; SPIE Society of Photo-Optical Instrumentation Engineers (1983). (CONF-8310172—).

From Advances in soft x-ray science and technology conference; Upton, NY, USA (17 Oct 1983).

The authors have measured the reflectivity of several multilayer dispersion elements are measured between 80 and 500 eV. Two samples of ReW-C and one of Ni-C with 2d spacing of approximately 70 A and 150 A were tested at angles of incidence between 10° and 80°. Measurements were made by fixing the incident and reflected angles (Bragg) and scanning the photon energy. Theoretical analyses of these multilayers have also been made and the results are compared with the experimental measurements.

Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Jun 1986. 12p. (CONF-860608--9). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750464.

From World congress on high tech ceramics: electronic, engineering, nuclear, biomedical research and applications in focus; Milan, Italy (23 Jun 1986).

Boron carbide is a refractory hard and light material of interest in nuclear technology (fission and also fusion). Transmission electron microscopy was used to examine the properties of radi-

ation induced damage. Firstly, the production of point defects and their clustering was studied in samples irradiated by 1 MeV electron in a high voltage electron microscope at selected temperatures from 12 K to 1000 K. Secondly, conventional transmission electron microscopy was used to understand the production of helium bubbles in neutron irradiated boron carbide and their role in the generation of microcracks. Finally, the interaction between point defects and bubbles was also examined.

16326 **(CEA-CONF—8538) Irradiation damage in γ-$LiA10_2$.** Auvray-Gely, M.H.; Dunlop, A. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Jun 1986. 10p. (CONF-860608—10). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750465.

From World congress on high tech ceramics: electronic, engineering, nuclear, biomedical research and applications in focus; Milan, Italy (23 Jun 1986).

Using EPR measurements at temperatures ranging from 30 K to 300 K, we studied the response of lithium aluminate single crystals to the irradiation with electrons in the MeV range at 20 K and with X-rays at room temperature. In the electron-irradiated γ-$LiA10_2$ sample, we observed three different paramagnetic defects - that were absent prior irradiation - whose EPR features are described here. Two of these defects were also present in the X-ray irradiated sample. The latter result proves that, in the γ-$LiA10_2$ sample, a photochemical mechanism exists, that is efficient in producing these two defects.

16327 **(CONF-860763—5) Development of nuclear magnetic resonance imaging techniques for characterizing green-state ceramic materials.** Ackerman, J.L.; Ellingson, W.A.; Koutcher, J.A.; Rosen, B.R. (Argonne National Lab., IL (USA); Massachusetts General Hospital, Boston (USA). Radiology Dept.). Oct 1986. Contract W-31-109-ENG-38. 10p. NTIS MF A01; 2; GPO Dep. File Number DE87004987.

From Nondestructive characterization of materials; Montreal, Canada (21 Jul 1986).

The overall objective is to develop NMR methods for nondestructive evaluation in ceramics processing. This report describes preliminary research directed toward the use of NMR for nondestructively mapping porosity and internal voids in green-state bodies. Some future extensions of this work include the imaging of pore size distribution, and the imaging of binders, plasticizers and other components of the test sample. The investigators have shown it is possible to nondestructively image the internal volumes in a green-state ceramic body using filler fluids to provide NMR signal intensity. Features on the order of 300 μm can be detected in a field of view of 100 mm, and porosity may be imaged and measured as a fraction of maximum signal intensity. With improvements of the NMR apparatus specifically targeted to materials science applications, much higher resolution can be achieved: resolution approaching 10μm has recently been reported for very small biological samples. In addition to developing NMR probes optimized for ceramics processing development, we are proceeding to design experimental methods which employ cross-polarization techniques to image the organic phase directly. 18 refs., 4 figs.

16328 **(CONF-860968—4) Theory of the energetics and nonclassical nucleation for the tetragonal-monoclinic transformation of zirconia.** Chan, S.K. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 27p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004720.

From 3. international conference on the science of technology of zirconia; Tokyo, Japan (9 Sep 1986).

The energetics of the martensitic tetragonal-monoclinic transformation of zirconia are analyzed in terms of symmetry-adapted strains and elastic moduli. A nonclassical theory of nucleation is developed based on a solution of the time-dependent Ginzburg-Landau equation in conjunction with a Cahn-Hilliard type free energy functional for a shape-invariant diffused interface profile between the transformed and the parent phases. The critical radius of nucleation is derived as a function of temperature and applied stresses. The physical implications of the results towards both homogeneous and heterogeneous nucleations are discussed.

16329 **(CONF-861207—62) Theoretical studies of defects in binary and ternary oxides.** Ching, W.Y.; Ellis, D.E.; Lam, D.J. (Missouri Univ., Kansas City (USA). Dept. of Physics; Northwestern Univ., Evanston, IL (USA). Dept. of Physics). 1986. Contract W-31109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004704.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

This paper presents some preliminary results of electronic structure of substitutional defects and vacancy in binary and ternary cubic zirconium oxides obtained by the embedded molecular-cluster model calculation. The importance of electronic charge redistribution in the solids where the defect is introduced into the perfect lattice is highlighted and the effect of electron polarization of the surrounding ions of the defect discussed.

16330 **(CONF-8310105—2) Erosion damage in glass and alumina.** Ritter, J.E.; Strzepa, P.; Jakus, K.; Rosenfeld, L.; Buckman, K.J. (Massachusetts Univ., Amherst (USA). Dept. of Mechanical Engineering). 14 Aug 1984. Contract AC02-81ER10950. 6p. American Ceramic Society. File Number TI87003342.

From Joint meeting of the Basic Science and Nuclear Divisions of the American Ceramic Society; Columbus, OH, USA (30 Oct 1983).

The effect of room-temperature erosion on material removal from and strength properties of soda-lime glass and sintered alumina was determined. The results were compared to the elastic/plastic indentation fracture model. The dependence of erosion rate and strength of soda-lime glass on the kinetic energy of the impacting particles was in good agreement with predictions. The lack of agreement between theory and experiment for sintered alumina was attributed to microstructural aspects of the erosion damage that are not modeled by indentation fracture.

16331 **(IAE—3999/4) Mathematical simulation of fuel materials swelling according to a quasistatic void model.** (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1984. 24p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701283.

Technique and the algorithm solving the problem on fuel material swelling based on the quasistatic gas void model are given. Theories of plasticity and creep in increments are used for problem solving. The results of mathematical investigation of swelling in dispersed and single-component fuel are given, empirical dependences of fuel material swelling on burnup are concluded. 6 refs.; 6 figs.

16332 **(N—87-11892) Thermal barrier coating life prediction model development. Annual report.** Demasi, J.T. (Pratt and Whitney Aircraft, East Hartford, CT (USA)). Nov 1986. 213p. (NASA-CR—179508; NAS—1.26:179508; AR—2). NTIS, PC A10/MF A01.

A methodology is established to predict thermal barrier coating life in a environment similar to that experienced by gas turbine airfoils. Experiments were conducted to determine failure modes of the thermal barrier coating. Analytical studies were employed to derive a life prediction model. A review of experimental and flight service components as well as laboratory post evaluations indicates that the predominant mode of TBC failure involves thermomechanical spallation of the ceramic coating layer. This ceramic spallation involves the formation of a dominant crack in the ceramic coating parallel to and closely adjacent to the topologically complex metal ceramic interface. This mechanical failure mode clearly is influenced by thermal exposure effects as shown in experiments conducted to study thermal pre-exposure and thermal cycle-rate effects. The preliminary life prediction model developed focuses on the two major damage modes identified in the critical experiments tasks. The first of these involves a mechanical driving force, resulting from cyclic strains and stresses caused by thermally induced and externally imposed mechanical loads. The second is an environmental driving force based on experimental results, and is believed to be related to bond coat oxidation. It is also believed that the growth of this oxide scale influences the intensity of the mechanical driving force.

16333 **(N—87-12910) NDE reliability and process control for structural ceramics.** Baaklini, G.Y. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1986. 17p. (NASA-TM—88870; E—3276; NAS—1.15:88870; CONF-870505—2). NTIS, PC A02/MF A01.

From 32. international gas turbine conference and exhibition; Anaheim, CA, USA (31 May 1987).

The reliability of microfocus x-radiography and scanning laser acoustic microscopy for detecting microvoids in silicon nitride and silicon carbide was statistically evaluated. Materials- and process-related parameters that influenced the statistical findings in research samples are discussed. The use of conventional x-radiography in controlling and optimizing the processing and sintering of an Si_3N_4-SiO_2-Y_2O_3 composition designated NASA 6Y is described. Radiographic evaluation and guidance helped develop uniform high-density Si_3N_4 modulus-of-rupture bars with improved four-point flexural strength (857, 544, and 462 MPa at room temperature, 1200 C, and 1370 C, respectively) and reduced strength scatter.

16334 **(SAND—86-2126C) Vibrational characteristics and structure of heavy metal fluoride glasses containing thorium and zirconium.** Tallant, D.R.; Ward, K.J.; Bendow, B.; Poulain, M.; Poulain, M. (Sandia National Labs., Albuquerque, NM (USA); BDM Corp., Albuquerque, NM (USA); Rennes-1 Univ., 35 (France)). 1987. Contract AC04-76DP00789. 8p. (CONF-870138—1). NTIS, PC A02/MF A01. File Number DE87003789.

From 4. international symposium on halide glasses; Monterey, CA, USA (26 Jan 1987).

This paper reports a vibrational spectroscopic study of a series of glasses composed of Li-Ba-Th-Zr-fluoride in which Th^{4+} is progressively replaced by Zr^{4+}. In these glasses, Zr^{4+} shows a more pronounced variation in coordination number than previously observed. Distinct infrared reflectance and polarized Raman bonds due to Th^{4+} polyhedra are present only in the glasses containing less than 10 mole% ZrF_4. In the glasses containing 10 or more mole% ZrF_4, Raman and infrared bands due to Zr^{4+} polyhedra dominate the vibrational spectra, even in glasses where the ThF_4 concentration is greater than the ZrF_4 concentration. The difference in structural behavior or the Th^{4+} polyhedra as compared to the Zr^{4+} polyhedra is believed to be due to the smaller electric field intensity of the Th^{4+} and to the relatively restricted ability of Th^{4+} to vary its coordination number in response to the availability of F^{1-}.

16335 **Further aspects of the structure and magnetism of the layered compound Fe(III)ClMoO$_4$: Moessbauer spectroscopy, susceptibility, and powder neutron diffraction studies.** Torardi, C.C.; Reiff, W.M.; Lazar, K.; Zhang, J.H.; Cox, D.E. (E.I. du Pont de Nemours & Co., Wilmington, DE). *Journal of Solid State Chemistry;* **66**: No. 1, 105-115(Jan 1987). Contract AC02-76CH00016.

Aspects of the nuclear and magnetic structure of the three-dimensionally ordered state of the layered system Fe(III)ClMoO$_4$ are elucidated primarily on the basis of single crystal and powder Moessbauer spectroscopy and neutron powder diffraction refinements at various temperatures. The antiferromagnetically coupled spins and easy axis of magnetization for Fe(III)ClMoO$_4$ are indicated to lie in the tetragonal layers (ab planes) perpendicular to the c axis, which is parallel to the Fe-Cl bond vector of a local C/sub 4v/ FeO_4Cl chromophore. Additionally, the neutron diffraction data indicate a very significant c-axis contraction with decreasing temperature (2.7% between 295 and 5 K), with the rate of contraction being highest in the vicinity of the Neel temperature, T/sub N/ (~ 70 K). The structural changes that occur in the temperature range 300 to 5 K are discussed. Powder and single crystal magnetic susceptibility results to ~ 1.6 K as well as high field Moessbauer spectra to ~ 9 T are also presented. The latter indicate a spin flop transition with H/sub sf/ ~ 1 T. Alternate views of the low-dimensional magnetism of $FeClMoO_4$, evident as a broad maximum in its molar susceptibility at ~ 105 K, are discussed.

16336 **Mixed-mode fracture of ceramics.** Petrovic, J.J. (Los Alamos National Lab., Los Alamos NM). pp 127-136 of Fracture mechanics of ceramics: Vol. 8, Microstructure, methods, design, and fatigue. Bradt, R.C.; Evans, A.G.; Hasselman, D.P.H.; Lange, F.F. New York, NY; Plenum Press (1986). (CONF-8506128—).

From 4. international symposium on the fracture mechanics of ceramics; Blacksburg, VA, USA (18 Jun 1985).

The mixed-mode fracture behavior of ceramic materials is of importance for monolithic ceramics in order to predict the onset of fracture under generalized loading conditions and for ceramic composites to describe crack deflection toughening mechanisms. Experimental data on surface flaw mixed-mode fracture in various ceramics indicate that the flaw-plane normal stress at fracture decreases with increasing in-flawplane shear stress, although present data exhibit a fairly wide range in details of this σ - /tau/ relationship. Fracture from large cracks suggests that Mode II has a greater effect on Mode I fracture than Mode III. A comparison of surface flaw and large crack mixed-mode I-II fracture responses indicates that surface flaw behavior is influenced by shear resistance effects.

16337 **Transformation toughening in the $Al_2O_3Cr_2O_3$ / ZrO_2 - HPO_2 system: the effect of ZrO_2-HFO_2 content.** Brog, T.K.; Tien, T.Y.; Wallace, J.S. (Univ. of Michigan, Ann Arbor, MI). pp 143-150 of Fracture mechanics of ceramics: Vol. 8, Microstructure, methods, design, and fatigue. Bradt, R.C.; Evans, A.G.; Hasselman, D.P.H.; Lauge, F.F. New York, NY; Plenum Press (1986). (CONF-8506128—).

From 4. international symposium on the fracture mechanics of ceramics; Blacksburg, VA, USA (18 Jun 1985).

The fracture toughness, strength, and modulus of AL_2O_3-Cr_2O_3 (matrix) /ZrO_2-HfO_2 (dispersed phase) composites were measured. The fracture toughness increased with increasing volume fraction dispersed phase whereas the strenght and modulus remained nearly constant up to 10v/o dispersed phase and then decreased for larger volume fractions. Multiple toughening mechanisms are apparently active in this system, with microcrack nucleation/growth dominating at high monoclinic contents.

16338 **Fracture mechanisms in lead zirconate titanate ceramics.** Freiman, S.W.; Chuck, L.; Mecholsky, J.J.; Shelleman, D.L. (National Bureau of Standards, Gaithersburg, MD). pp 175-186 of Fracture mechanics of ceramics: Vol. 8, Microstructure, methods, design, and fatigue. Bradt, R.C.; Evans, A.G.; Hasselman, D.P.H.; Lauge, F.F. New York, NY; Plenum Press (1986). (CONF-8506128—).

From 4. international symposium on the fracture mechanics of ceramics; Blacksburg, VA, USA (18 Jun 1985).

Lead Zirconate Titanate (PZT) ceramics can be formed over a wide range of $PbTiO_3$/$PbZrO_3$ ratios and exist in a number of crystal structures. This study involved the use of various fracture mechanics techniques to determine critical fracture toughness, K / SUB IC/ , as a function of composition, microstructure, temperature, and electrical and thermal history. The results of these experiments indicate that variations in K /SUB IC/ are related to phase transformations in the material as well as to other toughening mechanisms such as twinning and microcracking. In addition, the strength and fracture toughness of selected PZT ceramics were determined using specimens in which a crack was introduced by a Vicker's hardness indentor. The variation of K /SUB IC/ with composition and microstructure was related to the extent of twin-crack interaction. Comparison of the plot of strength as a function of indentation load with that predicted from indentation fracture models indicates the presence of internal stresses which contribute to failure. The magnitude of these internal stresses has been correlated with electrical properties of the ceramic. Fractographic analysis was used to determine the magnitude of internal stresses in specimens failing from "natural flaws."

16339 **Slow crack growth in sintered silicon nitride.** Khandelwal, P.K.; Chang, J.; Heitman, P.W. (Allison Gas Turbine Div., General Motors Co., Indianapolis, IN). pp 351-362 of Fracture mechanics of ceramics: Vol. 8, Microstructure, methods, design, and fatigue. Bradt, R.C.; Evans, A.G.; Hasselman, D.P.H.; Lauge, F.F. New York, NY; Plenum Press (1986). (CONF-8506128—).

From 4. international symposium on the fracture mechanics of ceramics; Blacksburg, VA, USA (18 Jun 1985).

The strength and crack growth characteristics of a sintered silicon nitride were studied at 1000 °C. Fractographic analysis of material failing in dynamic fatigue revealed the presence of slow crack growth (SCG) at stressing rates below 6 ksi/min. This material can sustain a 40 ksi flexural stress at 1000 °C for 400 hr or more but is susceptible to both slow crack growth and creep deformation at higher stress levels. The crack velocity exponent (N) determined both from dynamic and static fatigue experiments lies in a range from 13 to 22. The subcritical crack growth and creep behavior at 1000 °C is primarily controlled by the deformation of an intergranular glassy phase.

16340 **The elastic properties of LaNbO/sub 4/.** Nevitt, M.V.; Chan, S.K.; Grimsditch, M.H.; Fisher, E.S. (Materials Science and Technology Div., Argonne National Lab., Argonne, IL 60439). pp 391-396 of Materials characterization. Cheung, N.W.; Nicolet, M.A. Pittsburgh, PA; Materials Research Society (1986). (CONF-860445—). Contract W-31-109-ENG-38.

From Materials Research Society spring meeting; Palo Alto, CA, USA (15 Apr 1986).

The measurement of single-crystal elastic properties is an important method of materials characterization. Elastic properties define intrinsically bulk behavior, but they also provide a microscopic insight into the dynamical behavior of the crystal lattice in relation to crystal structure and bonding. Moreover, they are particularly informative probes into the onset and the nature of a lattice instability and its role in inducing a phase transformation. On a macroscopic scale, stress-strain relationships, particularly those of an anisotropic kind, can be better understood and described in terms of the single-crystal elastic constants. The authors discuss the recent measurements on the elastic properties of a single crystal of LaNbO/sub 4/ to exemplify these points. This rather extensively studied double-cation oxide has a crystal structure in which isolated niobium-centered NbO/sub 4/ tetrahedra are linked by La ions.

16341 **Use of ion channeling axial scans in the study of ion-implanted Al_2O_3.** Farlow, G.C.; White, C.W.; Appleton, B.R.; Sklad, P.S.; McHargue, C.J. (Oak Ridge National Lab., TN). *Materials Research Society Symposia Proceedings;* **41**: 295-299(1985). Contract AC05-84OR21400.

Rutherford backscattering and ion channeling-axial scans have been used to study lattice sites for several impurities implanted into Al_2O_3. The case of Ga implanted in Al_2O_3 is discussed and is shown to be substitutional on the Al sublattice. Additionally, the use of this technique in the study of precipitates in Al_2O_3 is discussed with reference to Fe implanted Al_2O_3 which was annealed in either oxygen or hydrogen. 6 references, 4 figures.

16342 **Electronic structure of LaN; prediction of a small band overlap semi-metal.** Norman, M.R.; Jansen, H.J.F.; Koelling, D.D.; Freeman, A.J. (Argonne National Lab., IL). *Solid State Communications;* **52**: No. 8, 739-741(1984).

Results of a detailed theoretical investigation are reported which appear to resolve whether LaN is a semiconductor or a semi-metal. It is found that LaN has a band overlap of approximately 40 mRy making it a semi-metal. A detailed analysis of the physical approximations and of the numerical precision indicate that this result has an uncertainty of ~ 15 mRy which is too small to alter the conclusion. 14 references, 1 table.

16343 **Electrolytic coloration and electrical breakdown of MgO single crystals.** Abraham, M.M.; Boatner, L.A.; Christie, W.H.; Modine, F.A.; Negas, T.; Bunch, R.M.; Unruh, W.P. (Oak Ridge National Lab., TN). *Journal of Solid State Chemistry;* **51**: 1-16(1984). Contract W-7405-ENG-26.

A series of investigations of electrolytic coloration effects produced in MgO single crystals containing iron-group impurities has been carried out. The purpose of these investigations was to determine the identity and production mechanism of localized coloration or dark streaks that are frequently observed following the electrical breakdown of MgO crystals at temperatures in the range of 1000°C. A technique employing a point contact cathode was [illegible] to reproduce these coloration effects in a controlled systematic manner. Studies using a variety of techniques (MCD, EPR, SIMS, light scattering, etc.) establish the formation of metallic precipitates by electrolytic reduction of impurities is primarily responsible for the observed localized dark coloration effects. In situ observations of the coloration process showed that it was initiated at the cathode and that the regions of coloration are coincident with those regions of the MgO crystal where the catastrophic failure in electrical insulating properties occurs. Electrical breakdown and coloration effects were observed in MgO crystals doped with each member of the entire 3d transition series except scandium. Crystals doped with different impurities did vary, however, in their tendency to fail electrically. Similar solid state chemical alterations were induced by more conventional reduction techniques which generally required higher temperatures to produce metallic colloids than electrolysis. 20 references, 12 figures, 1 table.

16344 **Physical properties of oxide containing metal precipitates. Part II.** Narayan, J.; Chen, Y. (Oak Ridge National Lab., TN). *Philosophical Magazine, [Part] A: Defects and Mechanical Properties;* **49**: No. 4, 475-492(1984). Contract W-7405-ENG-26.

The optical and mechanical properties of MgO single crystals containing coherent metal precipitates or colloids have been investigated. The optical absorption spectra of these materials were characterized by broad optical bands centered near 2.2 and 5. eV. By changing the size distribution of the precipitates, it was possible to obtain optical spectra of these materials suitable for solar selective absorber applications. Dislocations and sub-boundaries were found to provide nucleation sites for the formation of precipitates. The presence of these extended defects decreased the minimum temperature at which precipitates can be formed. The precipitates increased yield stress by a factor of about 4, and resulted in an increase in the room-temperature ductility of about 50%. Microstructures of deformed specimens revealed anchoring or pinning of mobile dislocations by precipitates as the probable cause for the increase in yield stress. The precipitates also enhanced ductility by providing dislocation sources, including punching out of dislocation loops. The coherent precipitates were found to transform into incoherent ones on deformation or laser irradiation. In situ fracture studies have shown the role of precipitates in preventing the propagation of cracks. By providing dislocation sources, the precipitates inhibit the propagation of cracks. 18 references, 10 figures, 1 table.

16345 **(AD-A—173630/5/XAB) Heat capacities of rare gases adsorbed on graphite. Technical report.** Battaglia; Kim, Y.S.; George, T.F. (State Univ. of New York, Buffalo (USA). Dept. of Chemistry). Sep 1986. 23p. (UBUFFALO/DC—86/TR-14). NTIS, PC A02/MF A01.

The McQuistan-Hock model is used to investigate adsorption for realistic systems. After computing the partition function in the most convenient ensemble for the problem under consideration, i.e., the isothermal-isobaric ensemble, the heat capacity for submonolayer films of Ne, Ar and Xe on graphite is computed for several coverage values. Heat-capacity signatures exhibit maxima at temperature values that are in good agreement with experimental data.

16346 **(AD-A—174054/7/XAB) Damage assessment in composites by acoustic-ultrasonic technique. Final report, September 1985-August 1986.** Hahn, W.T. (Washington Univ., St. Louis, MO (USA)). Oct 1986. 3p. NTIS, PC A02/MF A01.

The damage development in cross-ply S-2 glass/epoxy laminates were assessed using acousto-ultrasonic (UA) and acoustic emission (AE) techniques. Acoustic-emission and acousto-ultrasonic measurements gave early warnings of damage initiation before transverse cracks became visible.

16347 **(ATR—86(8443)-1) Effects of hydrolysis on metallo-organic solution deposition of PZT [lead zirconate titanate] films.** Lipeles, R.A.; Coleman, D.J.; Leung, M.S. (Aerospace Corp., El Segundo, CA (USA). Chemistry and Physics Lab.). 30 Oct 1986. 17p. The Aerospace Corporation, El Segundo, CA 90245. File Number TI87900472.

The effects of hydrolysis on the degree of polymerization during metallo-organic solution deposition of lead zirconate titanate (PZT) films have been investigated. The reaction of lead 2-ethylhexanoate, zirconium n-tetrapropoxide, and titanium tetrabutoxide in isopropanol with water were studied using thermogravimetry, specular reflectance Fourier transform infrared spectroscopy (FTIR), and optical and electron microscopy. Films prepared from coating solutions having varying amounts of water exhibited dramatic differences in morphology. The films were spin-coated on platinum coated fused silica substrates and annealed at 525°C for 30 minutes. Unhydrolyzed coating solutions and solutions with a mole ratio of water to total metal of 0.5 yielded perovskite films with 0.5 to 5 μm grains. A mole ratio of 1.5 (the amount of water required to completely hydrolyze the metallo-organics in the solution) formed amorphous, porous films. The stability of the prepolymerized films inhibits crystallization and densification at moderate temperatures.

16348 **(BARC—1281) Development of optical thin film technology for lasers and synchrotron radiation.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701254.

Dielectric multilayer optical thin film devices play an important role not only in the working of lasers but also in different front line research activities using high power lasers and high intensity synchrotron radiation sources. Facilities are set up recently in the Spectroscopy Division to develop the optical thin film design and fabrication technologies indigeneously. Using the facilities thin film devices for different laser applications working in the wavelength range from 300 nm to 1064 nm were developed. Different technical aspects involved in the technology development are briefly described. 17 refs., 6 tables, 6 figures.

16349 **(CEA-CONF—8540) Hydrogen doping of silica by ion beam enhanced hydration.** Della Mea, G.; Mazzi, G.; Rossi-Alvarez, C.; Bezzon, G.; Chaumont, J.; Dran, J.C.; Mendenhall, M. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Jun 1986. 17p. (CONF-8606101—8). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750467.

From 5. international conference on ion beam modification of materials; Catania, Italy (9 Jun 1986).

Correlative H-depth profiles by means of the resonant nuclear reaction $^{1}H(^{15}N,\alpha\gamma)^{12}C$ and refractive index measurements have been performed on ion implanted vitreous silica (approximately 1 keV/amu lead ions) subjected to leaching with water at 100°C. Thermal annealing experiments have been conducted both before and after water attack; they indicate that the ion-induced defects are very stable, as they are not completely annealed after heating at 900°C. Hydrogen is strongly trapped in the silica matrix, being only partially released by heating above 500°C. In addition, the refractive index which is enhanced by ion implantation is not significantly modified by post-implantation hydration; this feature argues for the stability with time in wet environments of the optical properties of ion beam processed optical fibers based on silica.

16350 **(CEA-CONF—8558) Relationship between leaching of trace elements (Cs, Sr and Co) and microstructure during aging of a mortar with a matrix of artificial Portland cement.** Lameille, J.M.; Chiappini, R.; Goutiere, G. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Sep 1986. 8p. (In French). (CONF-8609189—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750587.

From 8. international congress on cement chemistry; Rio de Janeiro, Brazil (22 Sep 1986).

Safety of storage of radioactive wastes solidified in cement matrix for more than 300 years requires the forecasting of radioactivity release variations. Release of Co-60, Sr-90 and Cs-137 by water leaching of a borated cement and evolution of microstructure are studied in this paper. Influence of boron on microstructure and on mechanical and physical properties of the matrix is not important at least for 2 years. But the variation of radioactivity release is very important for the same period. Cesium is trapped in mainly aluminous hydrates and slightly in hydrated calcium silicates and calcium oxides, strontium is trapped in sulfoaluminates and slightly in silicates and cobalt is trapped in the solid during hydration by formation of cobalt hydroxy chlorides.

16351 **(DOE/ER/45056—3) UV laser induced photochromic centers in cerium doped calcium fluoride.** Pogatshnik, G.J.; Hamilton, D.S. (Connecticut Univ., Storrs (USA)). Jan 1987. Contract FG02-84ER45056. 151p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE87005359.

The optical excitation of the lowest 4f to 5d transition in Ce^{3+}:CaF_2 by the 308 mm output of a Xe-Cl excimer laser results in strong coloration. The centers created were found to be divalent cerium ions at cubic sites. The system exhibits photochromic properties; the crystal can be returned to the original transparent state by illuminating it with light which is absorbed by the divalent cerium ions. The creation process for these photochromic centers involves a resonant two-photon transition from the 4f ground state of the cerium ion to the conduction band of the CaF_2 host. The lowest 5d level of the cerium ion serves as the real intermediate state for this transition. The photoionized electron can be trapped by another trivalent cerium ion at a site of cubic symmetry. These impurity sites with O/sub h/ symmetry result when the charge compensator associated with the rare earth ion is somewhat removed from the cerium ion site. The charge compensator is needed to maintain charge neutrality in the crystal when a trivalent rare earth is substituted for a Ca ion in the host lattice. The absence of a local charge compensator at a Ce^{3+} site with O/sub h/ symmetry, provides a net positive Coulombic potential, which aids in the trapping of electrons from the conduction band. The capture of an electron by a cerium ion at cubic site, changes the valence state of the ion to Ce^{2+} which accounts for the coloration of the crystal after illumination with uv laser light. A model for the production of the photochromic centers is presented.

16352 **(DOE/ER/45056—4) Ground and excited state photoconductivity measurements of Ce^{3+}:YAG.** Ghen, R.D.; Hamilton, D.S. (Connecticut Univ., Storrs (USA)). Jan 1987. Contract FG02-84ER45056. 34p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005358.

There does not seem to be any fundamental problem associated with using high intensity short duration pulsed laser sources for photoconductivity research. The observed photocurrent was linear with respect to both the applied electric field and the incident photon flux. No saturation effects of the photocurrent were observed at these applied electric fields and photon fluxes. The excited state photoconductivity experiment demonstrated the feasibility of such experiments as well as confirming that the strong excited state absorption transition in Ce^{3+}:YAG terminates in the YAG conduction band. The optical absorption from the 5d excited state led to an increase in the photocurrent which was due to an electron being promoted to the host conduction band.

16353 **(DOE/ER/45056—5) Energy transfer and nonlinear optical properties at near ultraviolet wavelengths: Rare earth 4f → 5d transitions in crystals and glasses: Progress report for the period June 1, 1986 to May 31, 1987.** Hamilton, D.S. (Connecticut Univ., Storrs (USA)). Jan 1987. Contract FG02-84ER45056. 37p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005355.

The project has considered several aspects of how high fluence, near ultraviolet laser light modifies the optical properties of cerium doped crystals. Illumination of Ce^{3+}:CaF_2 at 308 nm leads to a two-photon photoionization and the subsequent creation of photochromic color centers. A photoconductivity cell has been used to verify the two-step multi-photon ionization in Ce^{3+}:YAG and Ce^{3+}:CaF_2. Measurements of optical gain and loss in Ce^{3+}:$LiYF_4$ are presented. A microcomputer controlled thermoluminescence spectrometer has been built to determine electron trap

depths in rare-earth ion doped solids following their exposure to uv photoionizing light.

16354 **(DOE/ER/45116—18) Ab-initio determination of the structure of a grain boundary by simulated quenching.** Payne, M.C.; Bristowe, P.D.; Joannopoulos, J.D. (Massachusetts Inst. of Tech., Cambridge (USA)). Feb 1987. Contract FG02-84ER45116. 19p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005362.

Results of the first completely ab-initio investigation of the microscopic structure of a grain boundary in a semiconductor are presented. Using the molecular dynamics simulated annealing method for performing total energy calculations within the local density functional and pseudopotential approximations, the $\Sigma = 5(001)$ twist boundary in germanium is studied. A number of rotation-and-translation states are investigated leading to a prediction for the structure of this geometry. Evidence for the possible presence of novel defects and glass-like tunneling mode states at grain boundaries is presented.

16355 **(DOE/ER/45258—1) The role of point defects on structural phase transitions: Progress report for the year 1986-1987.** Goldstein, J.I. (Lehigh Univ., Bethlehem, PA (USA)). 1987. Contract FG02-86ER45258. 10p. NTIS MF A01. File Number DE87004295.

Structural phase transitions were investigated in Li-doped $KZnF_3$ and $KMnF_3$ and in $K(Ta,Nb)O_3$. Ultrasonic method were used. (DLC)

16356 **(DP—1728) Long-term leaching behavior of simulated Savannah River Plant waste glass: Part 1, MCC-1 leachability results, four-year leaching data.** Wicks, G.G.; Stone, J.A.; Chandler, G.T.; Williams, S. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Aug 1986. Contract AC09-76SR00001. 107p. NTIS, PC A06. File Number DE87004515.

Long-term leaching data were obtained on SRP 131/TDS waste glass using MCC-1 or slightly modified MCC-1 standard leaching tests. Experiments were conducted out to four years at 40°C and 3-1/2 years at 90°C. These experiments have produced the longest standardized leaching data currently available in the waste management community. Long-term leaching data provide important input to modeling of waste glass behavior and ultimate prediction of waste glass performance. In this study, the leaching behavior of SRP waste glass was found to be excellent; leachates based on a variety of elements were not only very low, but also improved with increasing time. In addition to these data, results are also reported from another independent Savannah River study. Leaching behavior at 40°C and 90°C was assessed not only for a similar SRP 131 waste glass composition, but also for extreme waste glass compositions involving high-iron and high-aluminum waste. In addition, these experiments were performed using not only a standard deionized water leachant, but also simplified brine and silicate groundwater simulations. These two large data bases will be summarized and correlated along with some of the more interesting results recently reported in another study, a two-year leaching program performed on a similar SRP waste glass composition at Battelle Pacific Northwest Laboratories.

16357 (EPRI-CS—4918-Vol.3, pp 8.1-8.22) **Evaluation of acid-resistant synthetic needled felt filter media in coal-fired boiler pulse-jet baghouses.** Grubb, W.T. (W.W. Criswell Co., Riverton, NJ). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Glass fabrics, both woven and needled, have been the most widely utilized filter media for coal-fired boiler pulse-jet baghouses in the US. Although glass fabrics, aided by conservative design considerations, have performed adequately in many of these installations, their performance in many other units has been limited by their intrinsically poor abrasion resistance and inadequate resistance to acid conditions in cyclic boiler operations. Synthetic filter media possess abrasion resistance which is inherently superior to glass, but the use of synthetics has been limited by their lower temperature capabilities, acid resistance inferior to that of glass, or high initial cost. Recent developments such as Ryton (polyphenylene sulfide) fiber, acid resistant treatments for aramid (Nomex) felt, Rastex PTFE scrims, and modified aramid fiber are being evaluated in many boiler baghouses where glass fabric performance was inadequate. The results of several of these on-going trial installations are presented in this paper. 10 references, 3 figures, 10 tables.

16358 **(EUR—9772) EC static high-temperature leach test. Summary report of an European Community interlaboratory round robin.** Koennecke, R.; Kirsch, J. (Commission of the European Communities, Luxembourg). 1985. 267p. NTIS (US Sales Only), PC A12/MF A01. File Number DE87750550.

The results of an interlaboratory static high-temperature leach test conducted by the Commission of the European Communities in 1983 over a period of 9 months are compiled and statistically evaluated. A total of 12 laboratories - 10 from Member States of the EC and one from Finland and the USA - provided information concerning the test method and the analytical test results in the frame of a round robin test (RRT). All together these laboratories tested 366 waste from specimens of the borosilicate glass UK 209 containing simulated high-level radioactive waste. Leach tests were performed on the basis of the "Document on the EC static high-temperature leach test method" in autoclaves at leaching temperatures of 90°C, 110°C, 150°C, and 190°C over time periods of 3, 7, 14, 28 and 56 days using dionized water as leachant. The resulting leachates were analysed for the elemental concentrations of Si, B, Sr, Nd and Cs by all laboratories and for the concentrations of the optional elements Na, Al, Ce, Mo, Cr, Fe, Li, Mg and Zn by some of the participating laboratories. Additionally, the F content of the blank leachates was analysed by all laboratories.

16359 **(INPE—009-PRE/1001) Density of states due to pairing of impurities in semiconductor systems.** Deandradaesilva, E.A.; Dacunhalima, I.C.; Ferreiradasilva, A. (Instituto de Pesquisas Espaciais, Sao Jose dos Campos (Brazil)). Oct 1986. 18p. NTIS, PC A02/MF A01.

The pair formation of hydrogen - like impurities in 3-D and 2-D systems is studied. The density of states is obtained for the ground state of the H_2 - like molecule and H_2+ - like ion for concentrations realizable in doped semiconductors and MOS structures. The joint density of states for the transition H_2 yields H_2+ is also obtained. The calculated bandwidth shows that pair formation is relevant in those systems.

16360 **(N—87-11893) Thermal conductivity of pristine and brominated P-100 fibers.** Hung, C.C.; Miller, J. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1986. 19p. (NASA-TM—88863; E—3263; NAS—1.15:88863; CONF-860333—2). NTIS, PC A02/MF A01.

From General meeting of the American Physical Society; Las Vegas, NV, USA (31 Mar 1986).

Thermal conductivity of brominated and pristine Union Carbide P-100 graphite fibers in the 30 to 160 C temperature range was determined by measuring thermal conductivities of graphite fiber epoxy composite samples and then excluding the epoxy contribution. A comparative thermal conductivity instrument was used to measure the thermal conductivity of the samples containing fibers. Results showed that the thermal conductivity values were 225 to 370 w/m-K and 215 to 340 w/m-K for pristine and brominated fibers, respectively. Furthermore, the thermal conductivity ratio of brominated to pristine P-100 fibers was 0.89, 0.91, and 0.92 at 55 to 80 C; 108 and 130 C, respectively. Such decrease in thermal conductivity results almost entirely from the 10 percent increase in fiber cross sectional area due to bromination. This result suggests that bromination effects on P-100 fiber structure is small, and that some structural changes, presumably the sharp-angled domain wall becomes less sharp, occurring in the 80 to 108 C temperature range.

16361 **(N—87-12356) Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986.** Bachmann, K.J. (North Carolina State Univ., Raleigh (USA)). Oct 1986. 28p. (NASA-CR—179884; NAS—1.26:179884). NTIS, PC A03/MF A01.

A research program on complex semiconducting compounds and alloys was completed that addressed the growth of single crystals of CdSe(y)Te(1-y), Zn(x)Cd(1-x)Te, Mn(x)Cd(1-x)Te, InP(y)As(1-y) and CuInSe2 and the measurement of fundamental physico-chemical properties characterizing the above materials. The purpose of this ground based research program was to lay the foundations for further research concerning the growth of complex ternary compound semiconductors in a microgravity environment.

16362 **(N—87-12679) Effects of graphitization on the environmental stability of brominated pitch-based fibers.** Gaier, J.R.; Slabe, M.E. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1986. 13p. (NASA-TM—88899; E—3323; NAS—1.15:88899; CONF-861207—60). NTIS, PC A02/MF A01.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

The residual bromine graphite intercalation compounds of high modulus pitch-based fibers (Amoco P-55, P-75, P-100, and P-120) were formed and their resistances were monitored under a variety of environmental conditions. A threshold graphitization was observed below which the bromination reaction does not occur to an appreciable extent. The graphitization of the P-55 fibers falls below that threshold, precluding an extensive reaction. The P-75, P-100, and P-120 fibers all form bromination compounds which are stable at ambient conditions, under vacuum, and under high humidity (100 percent humidity at 60 C). The thermal stability of the resistivity increased with decreasing graphitization, with the stable temperature for P-120 being 100 C; for P-100, 200 C; and for P-75, 250 C. When cost is a consideration, bromination of pitch-based fibers is an economical way to achieve low resistivities.

16363 **(N—87-12680) Investigation of the effects of cobalt ions on epoxy properties.** Singh, J.J.; Stoakley, D.M. (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Dec 1986. 16p. (NASA-TP—2639; L—16196; NAS—1.60:2639). NTIS, PC A02/MF A01.

The effects of Co(acac)sub x complexes on MY-720 epoxy properties have been investigated. It appears that some types of ions form antibonding or nonbonding orbitals which increase the free volume and also reduce the cohesiveness of the host epoxy, while others hand, seem to result in increased cohesiveness of the epoxy. The experimental values of magnetic moments of both types of ions in MY-720 suggest that the orbital momentum contributions of the (3d) electrons are partially conserved. The coordination environment of the cobalt ions in the host epoxy does not appear to be uniquely defined. These results indicate that the effects of metal ions on resin properties cannot be easily predicted on the basis of ligand field theory argument alone. Complex interactions between metal ions and host epoxy molecular structure suggest the desirability of parallel experimental investigations of electronic, magnetic, and mechanical properties of metal ion-containing epoxy samples for comparison with theory.

16364 **Transient enhanced diffusion and gettering of dopants in ion implanted silicon.** Pennycook, S.J.; Narayan, J.; Culbertson, R.J. (Oak Ridge National Lab., TN). *Materials Research Society Symposia Proceedings;* **36**: 151-156(1986). Contract AC05-84OR21400.

The authors have studied in detail the transient enhanced diffusion observed during furnace or rapid-thermal-annealing of ion-implanted Si. The authors show that the effect originates in the trapping of Si atoms by dopant atoms during implantation, which are retained during solid-phase epitaxial (SPE) growth but released by subsequent annealing to cause a transient dopant precipitation or profile broadening. The interstitials condense to form a band of dislocation loops located at the peak of the dopant profile, which may be distinct from the band formed at the original amorphous/crystalline interface. The band can develop into a network and effectively getter the dopant. They discuss the conditions under which the various effects may or may not be observed, and discuss preliminary observations on As^+ implanted Si. 12 references, 12 figures.

16365 **Effect of surface corrosion on glass fracture.** Bunker, B.C.; Michalske, T.A. (Sandia National Lab., Albuguergue, NM). pp 391-413 of Fracture mechanics of ceramics: Vol. 8, Microstructure, methods, design, and fatigue. Bradt, R.C.; Evans, A.G.; Hasselman, D.P.H.; Lauge, F.F. New York, NY; Plenum Press (1986). (CONF-8506128—).

From 4. international symposium on the fracture mechanics of ceramics; Blacksburg, VA, USA (18 Jun 1985).

The nature of aqueous corrosion reactions on glass surfaces varies with glass composition and environmental conditions. The authors show how the physical effects of the various surface reactions can be incorporated into simple fracture mechanics models to predict measured crack velocity effects in silicate glasses. The reactions on glass surfaces are divided into four categories: bond rupture reactions; alteration layer formation; surface deposition; and intermolecular surface forces. Results are demonstrated which show the effect of chemical reaction mechanisms on the long term mechanical behavior of glasses.

16366 **Ion beam channeling in superlattices.** Chu, W.K.; Allen, W.R.; Picraux, S.T.; Ellison, J.A. (Univ. of North Carolina, Dept. of Physics and Astronomy, Chapel Hill, NC 27514). pp 69-74 of Materials characterization. Cheung, N.W.; Nicolet, M.A. Pittsburgh, PA; Materials Research Society (1986). (CONF-860445—).

From Materials Research Society spring meeting; Palo Alto, CA, USA (15 Apr 1986).

Ion beam channeling analysis has recently been applied to lattice strain measuarements on strained-layer superlattices (SLS). In this review talk, the authors outline three different methods of strain measurement: axial dechanneling, angular scans, and planar resonance. They describe the principles and illustrate them with examples; they also give a detailed theoretical treatment of the planar resonance effect in SLS's.

16367 **High temperature Raman studies of phase transitions in thin film dielectrics.** Exarhos, G.J. (Pacific Northwest Lab., Richland, WA). *Materials Research Society Symposia Proceedings;* **48**: 461-469(1985). Contract AC06-76RL01830.

Rapid and unambiguous characterization of crystalline phases in submicron sputter deposited TiO_2 films on silica substrates can be inferred from measured Raman spectra. Pure anatase and rutile, mixed phase, and amorphous films to thicknesses of several hundred Angstroms and greater yield Raman spectra exhibiting little interference from the substrate when the appropriate component of the scattered light is analyzed. In situ Raman spectra were acquired as a function of temperature to 900°C using conventional radiant heating techniques and to temperatures near 2000°C using 10.6^+ radiation from a CW CO_2 laser as a localized heating source. Pulsed Raman excitation/gated detection techniques were used to minimize blackbody radiation interference at these high temperatures. Anatase and amorphous TiO_2 films transform irreversibly to the rutile phase at temperatures below 900°C while rutile appears to be sable at much higher temperatures. Measurements performed on uncoated silica substrates at temperatures where the glass becomes fluid suggest that the strongly crosslinked glass has partially transformed into a chain-like structure. 12 references, 8 figures.

16368 **Time resolved studies of rapid solidification in highly undercooled molten silicon.** Lowndes, D.H.; Jellison, G.E. Jr.; Wood, R.F.; Pennycook, S.J.; Carpenter, R.W. (Oak Ridge National Lab., TN). *Materials Research Society Symposia Proceedings;* **35**: 101-106(1985). Contract AC05-84OR21400.

A KrF (248nm) pulsed laser was used to melt 90-, 190-, and 440nm thick amorphous silicon layers produced by Si ion implantation into (100) crystalline Si substrates. Time-resolved reflectivity measurements at two different probe wavelengths (633 nm and 1.15 μm) and post-irradiation TEM measurements were used to study the formation of an undercooled liquid Si phase and the subsequent solidification processes. The time-resolved measurements provide

new experimental information about the nucleation of fine-grained Si crystallites in undercooled liquid Si, at low laser energy densities (E/sub l/), and about the growth of large-grained Si in the near-surface region at higher E/sub l/. Measurements with the infrared probe beam reveal the presence of a buried, propagating liquid layer at low E/sub l/. Model calculations indicate that this liquid layer is generated in part by the release of latent heat associated with the nucleation and growth process. 8 references, 4 figures.

16369 **Time-resolved ellipsometry and reflectivity measurements of the optical properties of silicon during pulsed excimer laser irradiation.** Jellison, G.E. Jr.; Lowndes, D.H. (Oak Ridge National Lab., TN). *Materials Research Society Symposia Proceedings;* **35**: 113-118(1985). Contract AC05-84OR21400.

Several advances in time-resolved optical measurement techniques have been made, which allow a more detailed determination of the optical properties of silicon immediately before, during, and after pulsed laser irradiation. It is now possible to follow in detail the time-resolved reflectivity signal near the melting threshold; measurements indicate that melting occurs in a spatially inhomogeneous way. The use of time-resolved ellipsometry allowed the authors to accurately measure the optical properties of the high reflectivity (molten) phase, and of the hot, solid silicon before and after the laser pulse. They obtain $n = 3.8$, $k = 5.2$ (+/-0.1) at $\lambda = 632.8$ nm for the high reflectivity phase, in minor disagreement with the published values of Shvarev et al. for liquid silicon. Before and after the high reflectivity phase, the time-resolved ellipsometry measurements are entirely consistent with the known optical properties of crystalline silicon at temperatures up to its melting point. 10 references, 3 figures.

16370 **Modeling of undercooling, nucleation, and multiple phase front formation in pulsed-laser-melted amorphous silicon.** Wood, R.F.; Geist, G.A.; Solomon, A.D.; Lowndes, D.H.; Jellison, G.E. Jr. (Oak Ridge National Lab., TN). *Materials Research Society Symposia Proceedings;* **35**: 159-168(1985). Contract AC05-84OR21400.

Recently available experimental data indicate that the solidification of undercooled molten silicon prepared by pulsed laser melting of amorphous silicon is a complex process. Time-resolved reflectivity and electrical conductivity measurements provide information about near-surface melting and suggest the presence of buried molten layers. Transmission electron micrographs show the formation of both fine- and large-grained polycrystalline regions if the melt front does not penetrate through the amorphous layer. The authors have carried out extensive calculations using a newly developed computer program based on an enthalpy formulation of the heat conduction problem. The program provides the framework for a consistent treatment of the simultaneous formation of multiple states and phase-front propagation by allowing material in each finite-difference cell to melt, undercool, nucleate, and solidify under prescribed conditions. Calculations indicate possibilities for a wide variety of solidification behavior. The new model and selected results of calculations are discussed here and comparison with recent experimental data are made. 12 references, 7 figures.

16371 **Superlattice structures grown by molecular beam epitaxy.** Dawson, L.R. (Sandia National Labs., Albuquerque, NM). pp 377-382 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—).

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

Strained-layer superlattices provide a wide range of tailorable electronic and optical properties, much of which cannot be achieved in lattice-matched alloys, or cannot be realized in mismatched alloys without the introduction of undesirable numbers of misfit defects. In some cases the strain can be used to achieve properties that cannot be achieved in any other manner. MBE has been used to prepare GaAs/In/sub .2/Ga/sub .8/As SLS material having high structural integrity, and excellent electrical, optical, and transport properties. Such materials have been incorporated into various device structures, including field effect transistors, photodetectors, and light emitting diodes with excellent initial results. The quality of the SLS material and its ability to exclude detrimental effects of misfit dislocations should allow its use in practical photovoltaic structures.

16372 **Amorphous materials and recrystallization.** Lucovsky, G.; Narayan, J. (North Carolina State Univ., Raleigh, NC 27650). pp 341-353 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—).

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

This paper deals with two materials science topics relevant to the utilization of semiconductors in energy systems. The first part of the paper focused on the local chemical bonding of alloy in a-Si and the second on the rapid recrystallization of ion-implanted and damaged semiconductor layers. Rapid crystallization methods based upon pulsed laser irradiation provide more efficient removal of ion implantation damage than conventional thermal annealing techniques. A "complete" electrical activation dopants and superior p-n junction properties are obtained by pulsed beam processing. The dopant concentrations far exceeding the equilibrium limits can be obtained, which may lead to novel advanced semiconductor devices. An example of application of pulsed beam processing in the fabrication of low-cost, high-efficiency solar cells is illustrated. The authors believe that the information provided in this paper will be useful and helpful to scientists and engineers who are primarily concerned with the fabrication, evaluation, and optimization of devices.

16373 **The surface electronic structure of GaAs(100) and GaAs(111) from angle resolved photoemission.** Bringans, R.D.; Bachrach, R.Z. (Stanford Synchrotron Radiation Lab., P.O. Box 4349, Stanford Univ., Stanford, CA 94305). pp 58-60 of Science with soft x-rays. Himpsel, F.J.; Klaffky, R.W. Bellingham, WA; SPIE Society of Photo-Optical Instrumentation Engineers (1983). (CONF-8310172—).

From Advances in soft x-ray science and technology conference; Upton, NY, USA (17 Oct 1983).

Angle resolved photoemission spectra have been measured for the polar (111) and (100) surfaces of GaAs. Strong differences exist in both cases between Ga-rich and As-rich surfaces in the energy region near the valence band maximum. Comparison of the spectra for the As-rich GaAs(111) (2x2) surface with a calculation of the location expected for bulk-derived features shows that the bulk bands appear to be folded back into the (2x2) surface Brillouin zone. No such effect is seen for the GaAs(100) c(4x4) surface.

16374 **(BARC—1252) X-ray fluorescence method for the determination of potassium, rubidium and cesium in thoria.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 7p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701248.

An XRF method for the determination of K, Rb and Cs in thoria has been developed using Philips PW-1220 semiautomatic X-ray spectrometer. Thoria samples are mixed with boric acid binder in proportion of 900 mg: 100 mg and the mixture is pressed over a boric acid backing pellet to form a double layer pellet. Tungsten target X-ray tube for excitation and LiF(200) crystal for dispersion have been used. The minimum determination limits of K, Rb and Cs are 100, 50 and 50 ppm respectively.

16375 **(BARC—1289) Sequential mass spectrometric analysis of uranium and plutonium employing resin bead technique.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 12p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701256.

Sequential mass spectrometric analysis of uranium and plutonium employing anion exchange resin bead technique is reported

using a high sensitive single stage magnetic analyser instrument, the routinely employed rhenium double filament assembly and 0.5M HNO/sub 3/ as a wetting agent for loading the resin beads. A precision of better than 0.3per cent (2sigma) is obtained on the isotopic ratio measurements. However, extreme care has to be exercised to carry the resin bead experiments under ultra clean conditions so as to avoid pick up of contamination. 8 refs.

16376 **(BARC—1299) Semi-microdetermination of nitrogen in actinide compounds by Dumas method.** (Bhabha Atomic Research Centre, Bombay (India)). 1986. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701262.

This report describes the application of the Dumas method for the semi-micro determination of nitrogen in actinide compounds and actinide complexes with organic ligands. The usual set up has been modified to make it adaptable for glove box operations. The carbon dioxide generator and nitrometer assemblies were located outside the glove box while the reaction tube and combustion furnaces were housed inside. The nitrogen gas collected in the nitrometer was read with the help of a travelling microscope with a vernier attachment fitted in front of the nitrometer burette. The set up was standardised using acetanilide and employed for the determination of nirtogen in various substances such as uranium nitride, and a variety of substituted quinoline and pyrazolone derivatives of actinides as well as some ternary uranium-PMBR-sulphoxide complexes. Full details of the technique and the analytical data obtained are contained in this report. 9 refs., 7 tables.

16377 **(BARC—1300) Status of data and data needs for XRF and PIXE based element analysis.** (Bhabha Atomic Research Centre, Bombay (India)). 1986. 25p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701263.

The status of data and data needs for X-ray fluorescence (XRF) and particle induced X-ray (PIXE) are examined to determine the areas where additional and improved data are required to improve the accuracy, precision and sensitivity of quantitative element analysis by the above techniques. 78 refs.

16378 **(BARC—1304) X-ray fluorescence analysis of thulium oxide/oxalate for rare earth impurities.** (Bhabha Atomic Research Centre, Bombay (India)). 1986. 18p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701267.

An X-ray fluorescence spectrometric method for the analysis of thulium oxide is described. For the analysis, the sample in oxalate form is mixed with boric acid binding material and pressed into a pellet over a supporting pellet of boric acid. A wavelength dispersive Philips PW 1220 X-ray fluorescence spectrometer is used for the experiments; the minimum determination limits are 0.002 percent for Ho, Lu and Y, 0.005 percent for Dy and Er and 0.01 percent for Yb. Calculations for theoretical minimum detection limits and percent standard deviation at each concentration of the standard are carried out. 15 refs., 5 tables, 4 figures.

16379 **(BARC—1306) Determination of La, Ce, Pr and Nd in carbon steels by optical emission spectroscopy (OES).** (Bhabha Atomic Research Centre, Bombay (India)). 1986. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701269.

A method is described for the determination of La, Ce, Pr and Nd in carbon steels by optical emission spectroscopy (OES). The method involves preconcentration of the four rare earth metals as fluorides in the presence of yttrium as carrier. During preconcentration, the maxtix Fe, is removed as soluble fluoride. The preconcentrated sample consisting of yttrium and microgramme quantities of the four rare earth metals, is ground with conducting graphite powder in the ratio 1:1 by weight. Standards have La, Ce and Nd in the concentration range 20-500 ppm and Pr in the range 50-500 ppm, are prepared using wet procedure. The spectra of samples and standards are recorded on a Jarrell-Ash 3.4 m Ebert plane grating spectrograph, with 30,000 l.p.i. grating in the wavelength region, 4200-4500 A, second order. Eight milligrammes each of sample and standard loaded in the cavity of a 1/4 U.C.C. graphite electrode are arced at 8 amp d.c. with an exposure time of 30 seconds. The relative standard deviation (RSD) ranges from +-7.4(La) to +-17.9per cent (Pr). 11 refs., 4 tables.

16380 **(BARC—1307) Spectrographic determination of boron in Mo-B microalloys.** (Bhabha Atomic Research Centre, Bombay (India)). 1986. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701270.

A spectrographic method is described for the determination of boron in Mo-B microalloys. Prior to spectrographic determination the sample is converted to oxide in presence of mannitol as complexing agent for boron. The oxide sample is ground with a mixture of ZnO and pure conducting graphite powder containing 10 percent NaF in the ratio 1:1:1 by weight. Standards containing boron in the range 10-500 ppm are also prepared by wet procedure. The spectra of samples and standards are recorded on a Hilger Large Quartz Spectrograph in the region 2400-3350 A. The line pair B 2496.8 A/Zn 2712.5 A is used for analytical calibration. The relative standard deviation (RSD) of the method is +-17.6per cent. 6 refs.

16381 **(BARC—1310) Determination of Ti, Cr, Cu and Ta in niobium oxide by X-ray fluorescence method.** (Bhabha Atomic Research Centre, Bombay (India)). 1986. 12p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701271.

An x-ray fluorescence method for the determination of Ti, Cr, Cu and Ta in niobium oxide has been developed. Samples/standards in powder form are mixed with boric acid in the proportion of 1:1 (400 mg. each). Double layer pellets are prepared by pressing this mixture over a primary boric acid pellet. Philips PW-1220, a semiautomatic x-ray spectrometer with tungsten target x-ray tube for excitation and LiF (200) crystal for dispersion have been used. The determination range is from 0.005 to 0.1 percent for Ti and Cr, 0.01 to 0.1per cent for Cu and 0.05 to 1per cent for Ta. 6 tables.

16382 **(CNIC—00004) Proton exciting X ray analysis. A new technique of trace element analysis in biomedicine.** (China Nuclear Information Centre, Beijing, BJ). Apr 1986. 13p. (In Chinese). (IAE—0004). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701274.

The analyzing capability of proton exciting X ray analysis for different elements in organisms was discussed, and dealing with examples of trace element analysis in the human body and animal organisms, such as blood serum, urine, and hair. The sensitivity, accuracy, and capability of multielement analysis were discussed. Its strong points for the trace element analysis in biomedicine were explained.

16383 **(CNIC—00008) Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/.** (China Nuclear Information Centre, Beijing, BJ). Apr 1986. 13p. (In Chinese). (IAE—0008). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701278.

The partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/ is described. A dissolving sample with electromagnetical mixer was designed. The oil bath of high boiling point was employed for dissolving sample. 30 mg PuO/sub 2/ could be dissolved completely about 20 minutes. The column partition chromagograph was used in which mixing extraction agent of TBP and TIOA (1:1) was employed as stationary phase, PTFCE powder as support, 3.5 N nitric acid as mobile phase. The determined trace elements were separated from 30 mg PuO/sub 2/ and collected in 1 ml receiving liquid. In which the low content of Pu did not interfere the determination. The indium was used as extra base, the indium and yttrium were used as inside marking elements. 29 trace elements (Cd, Ba, Be, Fe, Co, Si, B, Ga, Sc, P, Mn, Cr, W, Mg, Mo, Pb, Ni, Al, Ti, La, Ca, V, Ce, Cu, Ag, Zn, Li, Na, K) were determined cooperatively by ISP-28 type and ISP-51 type spectrograph using solution dry residue of high pressure spark. The range of the determination of the trace elements varies from 3 x 10/sup -6/ to 3 x 10/sup -2%. The recovery of this method varies from 83-120%. The precisio is within +-28%. The plutonium absorbed in the column can be desorbed by 4 N methanoic acid, for example, 30 mg PuO/sub 2/ can be desorbed quantitatively by 2 ml such desorbing agent.

16384 **(DOE/ER/13357—5) Laser light-scattering and laser fluorescence studies of solvent extraction systems.** Neuman, R.D. (Auburn Univ., AL (USA). Dept. of Chemical Engineering). 1986. Contract FG05-85ER13357. 8p. (CONF-860921—7). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003910.

From ISEC '86: international solvent extraction conference; Munich, F.R. Germany (11 Sep 1986).

The solvent extraction of metal ions from an aqueous solution to a nonpolar organic phase is a separation operation of major technological significance in the hydrometallurgical and nuclear industries. It is now recognized that the interrface plays a key role in the extraction process. However, the interfacial chemistry which occurs in the solvent extraction of metal ions is still very incompletely understood. Although investigations of the interfacial behavior of extraction reagents, in the past, have provided valuable information, progress is becoming more difficult in obtaining new fundamental information from classical surface-chemical approaches. The application of more sophisticated and recently developed techniques, such as laser techniques, holds promise for significant advances in understanding the molecular principles underlying the interfacial behavior of extractant molecules and thier interactions with metal ions. This paper will discuss recent advances in laser light-scattering and laser fluorescence techniques and their application to liquid/liquid interfacial systems.

16385 **(EUR—10026) Monitoring of Plutonium Contaminated Solid Waste Streams. A technical guide to design and analysis of monitoring systems.** Birkhoff, G. (Commission of the European Communities, Ispra (Italy). Joint Research Centre; Commission of the European Communities, Luxembourg). Jun 1985. 451p. NTIS (US Sales Only), PC A20/MF A01. File Number DE87750542.

The basic information on the Pu content in Pu Contaminated Materials (PCM) is the measurement of radiation emitted by Pu isotopes either spontaneously or due to irradiation by external neutron or gamma-sources. Requirements on measurement accuracy and detection limits should be defined by the operator of a Pu-handling facility in accordance with monitoring objectives in the very beginning of the planning of a monitoring system. Monitoring objectives reflect nuclear safety and radiological protection regulations and the needs for Pu-accountancy of nuclear materials management and safeguards. On considering the possibilities and limitations of radiometric techniques a solution of the monitoring problem is based on appropriate segregation and packaging procedures and records upon matrix and isotopic composition of PCM-items to be measured. The general interrelations between waste item characteristics and measurement uncertainty and detection limit are outlined in the first chapter which is addressed to the system planner. Chapter 2 is devoted to the attention of instrument developers and analysts. It presents in a general approach the correlations between the observed radiation leakage rate, respectively detection signal, and the generating source, e.g. Pu-isotopic content of the examined PCM item. Some practical measurement methods are reviewed and their limitations are indicated. The possible radiometric techniques based on detection of gamma rays from alpha decay (and ^{241}Am), neutrons from spontaneous fission and (α,n)-reaction and from induced fission reactions by neutron irradiation of Pu isotopes are presented. The measurement uncertainty of a single PCM item measurement is estimated on the basis of the uncertainty of the spatial distributions of source (Pu) and matrix materials. For the estimation of the cumulative error over a large collection of PCM items from a defined PCM-stream a probabilistic approach is suggested.

16386 **(EUR—10189) Analysis of rare earths and cadmium in reference materials: Li_2SO_4 and $MnSO_4$.** Berthelot, C.; Eschbach, H.L.; Verdingh, V.; Herrmann, S. (Commission of the European Communities, Geel (Belgium). Central Bureau for Nuclear Measurements; Commission of the European Communities, Luxembourg). 1986. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750549.

Reference materials of natural and isotopically enriched or depleted Li_2SO_4 are used for neutron cross section measurements. The detection limits of Sm, Eu, Gd, Dy and Cd in Li_2SO_4 by atomic emission spectroscopy (AES) and instrumental photon activation (IPA), correspond to a total contribution equivalent to the natural lithium (σ=70.5 barns), of 0.160% and 0.0213% respectively. $MnSO_4$ solutions are used for the calibration of neutron sources, e.g. ^{252}Cf. The direct analysis of Sm, Eu, Gd, Dy, and Cd in $MnSO_4$ by AES and IPA, provides detection limits from which the total contributions equivalent to the manganese (σ=13.3 b) are respectively 2.38% and 0.395%. In order to improve the detection limits of Rare Earths, a method had been developed for the R.E/Mn chemical separation which is based on the coprecipitation of Rare Earths as fluorides by HF in the presence of ammonium after the addition of very pure Y as a carrier. A solution of sup(152 + 154)Eu(1.11 x 10^5Bq) is used to monitor the recovery of the lanthanides. The Sc and Y are determined directly by AES or IPA. As an example, the contributions of Sm, Eu, Gd and Dy obtained by AES after the chemical separation of a solution containing 300 mg $MnSO_4$ per gram, are reduced to 0.0114%. The concentration of Cd found in this solution is 3.7 μg/g $MnSO_4$ and the total contribution of the 16 Rare Earths and Cd is <=0.107%.

16387 **(EUR—10441) Measurements of transuranium trace amounts in solution. Bibliographic study.** Billon, A.; Gaudez, M.T. (Commission of the European Communities, Luxembourg). 1986. 150p. (In French). NTIS (US Sales Only), PC A07/MF A01. File Number DE87750544.

A critical study based on the data of the literature published up to 1984 has been carried out on the measurements of transuranium traces in solution. The general technical aspects of the dosage of transuranium traces in solution and of their speciations were initially reviewed. The second part is devoted to the detailed review of various methods in use in the laboratories. This work has been carried out in the framework of the MIRAGE (migration of radionuclides in the biosphere) Community project. 85 refs.

16388 **(EUR—10445) Laser Induced Photoacoustic Spectroscopy for the oxidation specific determination of actinoids in solution.** Stumpe, R.; Kim, J.I. (Commission of the European Communities, Luxembourg). 1986. 63p. (In German). NTIS (US Sales Only), PC A04/MF A01. File Number DE87750551.

A laser induced photoacoustic spectroscopy (LPAS) is developed for the microscopic speciation of actinoids in natural aqueous solution. By introducing special detection instrumentation and signal processing system, a differential measurement of sample and reference solutions is realized. The LPAS provides a normal spectral work comparable to conventional absorption spectroscopy, only with the higher speciation sensitivity, e.g. 10^{-8} mol L^{-1} for the Am(III) ion. Applications of the LPAS are demonstrated for the speciation of oxidation state, hydrolysis reaction, complexation and colloid generation of actinoid ions in micro or submicromole range in pure solutions as well as natural groundwaters. 33 refs.

16389 **(EUR—10503) ^{235}Uranium isotope abundance certified reference material for gamma spectrometry EC nuclear reference material 171 certification report.** De Bievre, P.; Eschbach, H.L.; Lesser, R.; Meyer, H.; Audenhove, Van J.; Carpenter, B.S. (Commission of the European Communities, Geel (Belgium). Central Bureau for Nuclear Measurements; Commission of the European Communities, Luxembourg). 1986. 108p. NTIS (US Sales Only), PC A06/MF A01. File Number DE87750541.

This certification report contains the information necessary for the final certification of EC nuclear reference material 171. It is also intended to inform the user of the reference material concerned on technical/scientific details which are not given in the certificate. The report describes the reference material which consists of sets of U_3O_8 samples with five different ^{235}U/U abundances, filled in cylindrical aluminium cans. The can bottom serves as window for emitted gamma radiation. The report describes how the ^{235}U/U abundances were characterized, how the other properties relevant for gamma measurements were determined and gives all connected results as well as those from the verification measurements. Appendix A represents the draft certificate. 32 refs.

16390 **(Juel-Conf—55) Analysis of materials (metals, ceramics, minerals) using spectroscopic methods.** Rottmann, J. (comp.). (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)). Jan 1986. 160p. (CONF-8509177—). NTIS (US Sales Only), MF A01. File Number DE87751308.

From 24. colloquium spectroscopicum internationale; Garmisch-Partenkirchen, F.R. Germany (23 Sep 1985).

This report comprises a collection of all but one of the contributions made by the participants in the Post CSI Symposium. In the first part of this Symposium, KFA staff presented a survey of analysis and special spectroscopic investigations being carried out in the KFA. Several participants prepared presentations concerning their own spectroscopy activities. The contributions dealt partly with the development and advances in different spectroscopic techniques used in recent years in the iron and steel industry and in the investigations of graphitic, ceramic and geological materials. Of particular interest are the ICP methods and trace element analysis. In some of the presentations, various spectroscopic methods for analysis were applied and compared. One contribution dealt specifically with the preparations of specimens of materials that are difficult to dissolve. High temperature mass spectrometry was of special interest. The services offered by the Chemical Analysis Department (ZCH) of the KFA were presented; a variety of spectroscopic techniques for chemical analysis of materials was outlined in this contribution.

16391 **(KFK—4019) Application of different methods of neutron activation analysis to the determination of trace elements in rock samples.** Zaghloul, R.; Gantner, E.; Mostafa, M.; Ache, H.J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Radiochemie). Jun 1986. 71p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87750525.

In this report three different methods of neutron activation analysis applied to the determination of up to 20 trace elements in Egyptian rock samples and the results obtained are discussed. In Part I a physical approach is described for instrumental multielement activation analysis with whole neutron spectrum (without Cd-cover) using the monostandard (single comparator) method. 15 Samples representing different Egyptian granite rocks were analyzed. As many as 21 trace elements beside Fe, K and Na were determined. The accuracy of the method for nondestructive multielement analysis agrees within 3% with the relative method using multielement standards. In Part II a method is described for epithermal neutron activation analysis of 20 elements in granite rock samples using only one standard. Gold has been used as a single comparator due to its relatively high resonance integral value (I/sub o/ = 400) and in addition, it is preferable on Co in order to obtain a large epithermal activation in a short irradiation. The method of calculation is simple and rapid and can be done using small calculator. In Part III experiments are described in which a neutron capture gamma-ray spectroscopy facility assembled at the Institute of Radiochemistry, KfK (for analytical purposes) using Cf/sup 252/ neutron source of strength propor to 6 x 10/sup 7/ n/sec, has been used to check its applicability and sensitivity for quantitative analyses of ores. The analysis of Sm, Gd and Mn in phosphate and monazite rock samples has been carried out. The results from this study show a variation of about 25% from the values determined by RNAA method. The reasons for this discrepancy are discussed and suggestions are made to optimize the conditions of measurement and irradiation.

16392 (PNL—5500-Pt.4, pp 9) **Technology transfer of kinetic phosphorimetry.** Whitaker, T.J.; Bushaw, B.A. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Kinetic phosphorimetry, described in the 1982 annual report, has been the subject of a PNL technology transfer program. This technique provides rapid, accurate analyses for low concentrations of uranium in aqueous solution. It has several applications including bioassays, field assays for prospecting, and environmental monitoring. A prototype instrument based on this technology was displayed at the Twenty-ninth Annual Conference of Bioassay, Analytical and Environmental Chemistry in October 1983. A technical presentation was given at this and at other professional meetings, and direct communication was established with several instrument manufacturers. As a result of this program, two commercial companies plan to market an instrument based on kinetic phosphorimetry.

16393 (PNL—5500-Pt.4, pp 9-10) **Continuous wave double-resonance ionization and laser-enhanced electron impact ionization.** Whitaker, T.J.; Cannon, B.D.; Bushaw, B.A. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Resonance ionization spectroscopy (RIS) is recognized as an extremely sensitive analytical technique, but practically all experiments to date have been performed with pulsed lasers. Continuous wave (cw) lasers offer the advantage of narrow bandwidths for isotopic selectivity and an improvement of 10^4 to 10^5 in duty cycle. The authors are developing a technique that uses cw dye lasers to excite an atom to a high electronic state by sequential excitation through a resonant intermediate state or by a resonantly enhanced two-photon process. The excited atom is then ionized by a high-power cw infrared laser. Initial experiments have been performed on an effusive atomic beam of barium generated from an oven at temperatures up to 600°C. Counter-propagating dye laser beams (5 to 10 mW) and the beam from a cw Nd:YAG laser (up to 100 watts) intersect the atomic beam at right angles in the ionizing region of a quadrupole mass spectrometer. The relative ion yield of ^{137}Ba to ^{138}Ba is about 130.

16394 (PNL—5500-Pt.4, pp 10) **Laser analysis of directly injected supercritical fluids.** Cannon, B.D.; Udseth, H.R.; Whitaker, T.J.; Smith, R.D. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

This method of direct injection of supercritical fluids, described in the 1983 annual report is being investigated as a source of vapor phase molecules that may be proved by laser-induced fluorescence or resonance ionization mass spectrometry. This will allow normally low-volatility compounds, such as polynuclear aromatic hydrocarbons, to be introduced into a vacuum system as intact, vapor-phase molecules which may be analyzed by sensitive laser techniques. An added benefit of the direct injection process is the internal cooling that occurs in the molecule, an effect that produces sharp spectral features, and thus, better selectivity in laser analysis. Equipment is currently being assembled for initial experiments on this promising new technique.

16395 **(WAPD-T—2873) On-line ion chromatography system.** Lynch, G.J. (Bettis Atomic Power Lab., West Mifflin, PA (USA)). Jun 1986. Contract AC11-76PN00014. 17p. (CONF-870316—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87000912.

From 38. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy; Atlantic City, NJ, USA (9 Mar 1987).

A benchtop Dionex Series 2000i ion chromatography system has been modified and installed on-line to automatically perform production sampling and analysis of five high temperature and high pressure laboratory autoclave test systems. An HP-9816 microcomputer-controller for the ion chromatography system also controls the sampling and ensures that all systems are synchronized. This is a unique application of a system that heretofore has been used exclusively for benchtop laboratory work.

16396 **High efficiency direct detection of ions from resonance ionization of sputtered atoms.** Gruen, D.M.; Pellin, M.J.; Young, C.E. (to Dept. of Energy, Washington, DC). US Patent 4,633,084. 30 Dec 1986. Filed date 16 Jan 1985. vp.

A method is described for the quantitative analysis of a component in a sample comprising the steps of: bombarding the sample with a beam of energetic particles or photons to produce ion and neutral atom groups emanating in a direction away from the sample, selectively accelerating the ions in the ion group emanating from the sample for separation from the neutral atom group, directing one or more laser energy pulses at the neutral atom group to convert the neutral atoms to ions by laser initiated resonance ioni-

zation spectroscopy, causing the ionized neutral atoms to be selectively deflected with respect to the emanating ions to form a deflected beam of ionized neutral atoms, and detecting the ionized neutral atoms in the deflected beam as a measure of the quantity of the component in the sample.

16397 **Micro-tomography using synchrotron radiation.** Johnson, Q.C.; Kinney, J.H.; Bonse, U.; Nichols, M.C.; Nusshardt, R.; Brase, J.M. (Lawrence Livermore National Lab., Livermore, CA 94550). pp 203-208 of Materials characterization. Cheung, N.W.; Nicolet, M.A. Pittsburgh, PA; Materials Research Society (1986). (CONF-860445—).

From Materials Research Society spring meeting; Palo Alto, CA, USA (15 Apr 1986).

This paper discusses the results of recent experiments at Stanford Synchrotron Radiation Laboratory (SSRL) and Hamburger Synchrotronstrahlungslabor (HASYLAB) which were designed to explore the feasibility of using synchrotron radiation in high-resolution, computerized, critical-absorption tomography. The results demonstrate that it is possible, using absorption-edge differencing, to identify adjacent elements in the periodic table with high sensitivity. Furthermore, by using the fine structure in the absorption spectra, it is possible to distinguish between regions of different chemical states. Methods of using synchrotron radiation for high-resolution, three-dimensional chemical-state mapping in small samples are discussed.

16398 **Spatially-resolved non-contact methods for the investigation of transport and defects in semiconductors.** Amer, N.M. (Applied Physics and Laser Spectroscopy Group, Lawrence Berkeley Lab., Univ. of California, Berkeley, CA 94720). pp 51-58 of Materials characterization. Cheung, N.W.; Nicolet, M.A. Pittsburgh, PA; Materials Research Society (1986). (CONF-860445—).

From Materials Research Society spring meeting; Palo Alto, CA, USA (15 Apr 1986).

Photothermal spectroscopy employs the small rise in temperature associated with the absorption of electromagnetic radiation to probe optical and transport properties of materials. A review of the various photothermal detection schemes is given, and examples which illustrate the power of this technique are reviewed.

16399 **(BARC—1302) Water Chemistry Division Progress Report, April 1983-April 1985.** Momin, A.C.; Rao, U.R.K.; Venkateswaran, G. (eds.). (Bhabha Atomic Research Centre, Bombay (India)). 1986. 86p. NTIS (US Sales Only), PC A05/MF A01. File Number DE87701265.

The research and development work of the Water Chemistry Division during the period from April 1983 to April 1985 is reported in the form of individual summaries. The activities of the Division cover the following fields: water and steam chemistry, high temperature studies, single crystal structure by x-ray diffraction, vriable temperature, x-ray powder studies, thermal analysis and thermophysical properties of rare earth compounds and uranium chemistry.

16400 **(CEA-CONF—8519) Multiphoton dissociation of UF6 at lambda = 16 μm in supersonic jets.** Gilbert, M.; Weulersse, J.M.; Isnard, P.; Salvetat, G. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Jun 1986. 16p. (CONF-860620—11). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750472.

From Society of Photo-Optical Instrumentation Engineers international symposium: topics in optical and optoelectronic applied sciences and engineering; Quebec City, Canada (2 Jun 1986).

The multiple photon excitation of UF6 at 16μm has been studied in a number of laboratories, in view of its potential applications in uranium enrichment, using various schemes. Results are reported on two-frequency multiphoton dissociation of UF6 cooled at 90K in a supersonic expansion of Ar as the carrier gas, using a Raman source pumped by two TEA line-tunable CO2 lasers. Additional data were obtained on multiphoton absorption of UF6 at low and room temperatures, and on vibrational relaxation of UF6. 15 refs.

16401 **(CONF-8610159—2) Gas-phase chemical reactions of transition metal clusters with simple molecules.** Riley, S.J.; Parks, E.K. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 18p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004935.

From International symposium on the physics and chemistry of small clusters; Richmond, VA, USA (28 Oct 1986).

Chemical reactions of isolated transition metal clusters are studied in a laser-vaporization cluster source coupled to a continuous-flow reactor. Detection of reaction products is via laser ionization and time-of-flight mass spectrometry. Experimental probes that have been developed include: (1) kinetics measurements, in which the disappearance of bare cluster signal with increasing reagent gas flow is used to determine absolute reaction rate constants for the addition of the first adsorbate molecule; (2) product composition measurements, in which inferences as to cluster structure and the nature of surface binding sites are derived by determining the total number of adsorbates the clusters can accommodate; (3) laser-induced desorption experiments, from which adsorbate binding energies can be derived; and (4) the observation of actual chemical reactions on cluster surfaces, such as hydrogen/deuterium exchange or adsorbate photochemistry. In addition, a new experimental procedure has been developed that, in a single series of measurements, provides measures of the first three parameters listed above. A review is given of earlier studies of the reaction of iron clusters with hydrogen. More recent results on the reaction of iron clusters with ammonia, and the reaction of ammoniated iron clusters with hydrogen, are also presented.

16402 **(DOE/ER/45107—2) Photophysical studies of triplet exciton processes in pure polymer films: Technical progress report for the period February 1985-July 26, 1986.** Burkhart, R.D. (Nevada Univ., Reno (USA)). 1986. Contract FG08-84ER45107. 23p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003822.

An integrated system has been constructed to conduct experiments on time resolved photoluminescence processes into the low microsecond time regime. It is specifically designed for investigations of triplet photophysical processes in polymers and it is very sensitive providing, for the first time, triplet-triplet absorption spectra of poly(N-vinylcarbazole). A primary mission for this system is the direct detection of excited triplets using triplet-triplet absorption spectroscopy. Both spectroscopic and kinetic characteristics of polymeric triplet states have been investigated with this system. Quantitative measurements have been made of molar absorptivities, triplet quantum yields and specific rate constants for both radiative and radiationless transitions for poly[4-((vinyloxy) carbonyl)-carbazole] (PFCZ) and ot its monomeric analogue (MFCZ). In addition, specific rate constants for triplet-triplet annihilation have been evaluated for several polymers and molecularly doped polymeric systems. Additional studies include computer assisted resolution of the excimeric phosphorescence of poly(N-vinylcarbazole) and the synthesis of end-capped polystyrene molecules in order to investigate intramolecular exciton transfer. Work is also under way to determine contributions from intermolecular and intramolecular triplet exciton migration in very concentrated solutions of poly(2-vinylnaphthalene). 6 refs., 3 figs.

16403 **(DOE/PC/80536—T5) A new method of magnetic characterization of zeolite-cobalt catalysts: Quarterly technical progress report 5, Oct. 1, 1986 through Jan. 30, 1987.** Murty, A.N. (Grambling State Univ., LA (USA). Dept. of Physics). 10 Feb 1987. Contract FG22-85PC80536. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005608.

This report describes the results of our studies during the last quarter. One major objective of our investigation is to examine the effect on the NMR Spectrum of cobalt due to the method of impregnation of cobalt into the lattice of the medium pore zeolite ZSM-5. We have completed a comprehensive study of the physical-

ly admixed Co/Co-ThO_2 and ZSM-5 catalysts and the results are being published in the April issue of Journal of Applied Physics. The results of our studies on aqueously impregnated samples have been reported in the 4th quarterly technical progress report. This report presents the data on the acetone impregnated catalysts. A preliminary survey on a series of twelve acetone impregnated catalyst samples of Co-ZSM-5 and Co-ThO_2-ZSM5 has been carried out. The zero-field NMR spectra have been examined and analyzed for the two catalytic stages, before and after use, with and without thoria for three different metal loadings of cobalt (3%, 6%, and 9% by weight) in ZSM-5. 7 refs., 2 figs., 1 tab.

16404 **(KFK—3930-UF) Calculation of the carbonic acid equilibria taking into consideration complex formation of calcium and magnesium and the presence of phosphate, ammonia and boric acid.** Eberle, S.H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Radiochemie). Jun 1986. 142p. (In German). NTIS (US Sales Only), PC A07/MF A01. File Number DE87750864.

The theoretical background is given for considering the presence of complexes and other weak acids than carbonic acid in calculating carbonic acid equilibria in water chemistry. A computer programm WASA2T is described, in which the species mentioned are implemented. It allows the calculation of the m-value and total carbonate from one or two titrations of the water (alkalinity and acidity). Furthermore the calculation of the calcit saturation pH, of theoretical titration curves and of the pH for equilibrium with a gas atmosphere of known CO/sub 2/ partial pressure respectively is possible. Comparison of the calculated pH with experiments has shown an agreement better than $\Delta pH < 0.03$ as a mean value.

16405 **(NP—7770050) Synthesis and modification of zeolite catalysts for producing short-chain olefins from methanol and synthesis gas.** Heinze, V. (Paderborn Univ. (Gesamthochschule) (Germany, F.R.). Fachbereich 13 - Chemie und Chemietechnik). 10 Jan 1986. 109p. (In German). NTIS (US Sales Only), PC A06/MF A01. File Number DE87770050.

Boron-containing zeolites of the medium-pored pentasil type and the close-pored erionite-offretite type were synthesized, and the reaction conditions were optimized with regard to reaction times and product crystallinity. For example, the use of seed crystals resulted in a reduction of the crystallisation time from 120 to 60 h in the pentasil type. Pyrogenic silica gel can be substituted by silicate of sodium as a SiO/sub 2/ source. Substitution of organic ammonium compounds by less expensive substrates like alcohols or acetone can be recommended only for tert. butanol. The erionite-offretite-type zeolite, which has high boron and silicon concentrations, was synthesized for the first time and identified by IR spectroscopy and by Guinier radiography. The reaction mechanism of methanol or DME conversion was investigated. Modified Fischer-Tropsch synthesis experiments showed that the highest C/sub 2/-C/sub 4/ olefin selectivity was obtained with the iron-doped zeolite type A as catalyst (T=270 to 310/sup 0/C; p=1.5 to 2.2 MPa).

16406 **(NTB—85-22) Some considerations concerning the thermodynamics and kinetics of the reaction between iron and water in bentonite.** Heusler, K.E. (Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland)). Jun 1985. 23p. (In German). Nagra, Ch-5401 Baden, Switzerland.

The report presents the thermodynamic relations and equations for the equilibrium potential of an iron saturated magnetite electrode, the equilibrium hydrogen partial pressure and the solubility product of magnetite as a function of system temperature and pressure; the values of these functions are calculated from the known standard enthalpies, specific heats and molar volumes. For temperatures between 300 K and 600 K and for pressures up to 400 bar the most probable values of the hydrogen partial pressure is close to 1 kbar and the activity of divalent iron in equilibrium with magnetite is of the order of a few μM. The pH value corresponding to the equilibrium solubility in pure water is close to that of water in bentonite. It should be borne in mind that, in view of the uncertainties on the thermodynamic data upon which the calculations are based, the results can only be considered as orders of magnitude. The corrosion behaviour of iron in bentonite is discussed next. The corrosion rate is essentially determined by the parabolic growth of an oxide layer. Over a period of time of up to few years the corrosion rate should fall below 0.1 μm a/sup -1/, even at 150 C. Assuming this rate as stationary, it is shown that the equilibrium partial pressure of hydrogen cannot exceed some 60 bar. For these estimates the data used, especially as regards diffusion geometry, are those of current Nagra feasibility projects. For instationary conditions as well, partial pressures of only a few bar should be expected, although the corrosion rates are higher. At hydrostatic pressures of 100 bar or more gaseous hydrogen evolution cannot take place due to the kinetics of the process.

16407 **(ORNL/TM—9998) Viscosity behavior in supercooled pure liquids and mixtures.** Hughes, J.A.; Byers, C.H. (Oak Ridge National Lab., TN (USA)). Dec 1986. 55p. NTIS, PC A04/MF A01. File Number DE87004036.

Under relatively quiescent conditions, it is often possible to maintain fluids in a liquid state at temperatures below their freezing point. Viscosities of phenol and t-butanol in the freezing-point region deviate significantly from the Andrade correlation. Two Andrade curves, one above and one below the freezing point, cross at approximately the freezing point and fit the data well. An Antoine-type relationship fits all the phenol data well, but two such curves are required to fit the t-butanol data. The activation energy term in the Andrade equation increases significantly when the temperature drops below the freezing point. This may be interpreted as being the result of luster formation in the liquid, or at least the establishment of more short-range order in the supercooled fluid. Mixtures containing up to 1 mol % ethanol in t-butanol behaved, from a viscosity viewpoint, in a manner similar to pure t-butanol, that is, the viscosity relationship changed at the freezing point of the pure fluid and not at the freezing point of the mixture. The time dependence of the supercooled viscosity of the pure fluids was explored. 25 refs., 14 figs., 2 tabs.

16408 **(ORNL/TM—10324) Stable isotope customer list and summary of shipments, FY 1986.** Tracy, J.G. (comp.). (Oak Ridge National Lab., TN (USA)). Feb 1987. Contract AC05-84OR21400. 32p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005294.

This compilation is published as an aid to those concerned with the separation and sale of stable isotopes. The information is divided into four sections: alphabetical list of domestic and foreign customers, showing the stable isotopes purchased during the fiscal year; alphabetical list of isotopes, cross-referenced to customer numbers and divided into domestic and foreign categories; alphabetical list of states and countries, cross-referenced to customer numbers and indicating geographical concentrations of isotope users; and tabulation of the shipments, quantities, and dollars for domestic, foreign, and project categories for each isotope.

16409 **Synthesis, structure, and spectroscopic properties of early transition metal eta^2-iminoacyl complexes containing aryl oxide ligation.** Chamberlain, L.R.; Durfee, L.D.; Fanwick, P.E.; Kobriger, L.; Latesky, S.L.; McMullen, A.K.; Rothwell, I.P.; Folting, K.; Huffman, J.C.; Streib, W.E.; Wang, R. (Purdue Univ., West Lafayette, IN). *Journal of the American Chemical Society;* **109**: No. 2, 390-402(21 Jan 1987). Contract FG22-85PC80909.

The authors wish to report here a combination of synthetic, spectroscopic, and structural studies on a number of early transition metal aryl oxide compounds containing eta^2-iminoacyl ligands. This work has allowed us to isolate and study compounds containing more than one eta^2-iminoacyl function, a situation as yet unknown for their eta^2-acyl counterparts. Compounds such as these are of importance as they may give insights into the pathways whereby the observed intramolecular coupling (carbon-carbon double bond formation) of these types of ligand can take place to produce enediolate, enamidolate, or ene-diamide functional groups.

16410 **Ligand perturbation of the molecular and electronic structures of quadruply bonded dimers. The Crystal structures of $Mo_2Br_4(PMe_3)_4$ and $Mo_2I_4(PMe_3)_4$, and the vibrational and electronic spectra of a series of $M_2X_4L_4$ complexes.** Hopkins, M.D.; Schaefer, W.P.; Bronikowski, M.J.; Woodruff, W.H.; Miskowski, V.M.; Dallinger, R.F.; Gray, H.B. (California Institute of Technology, Pasadena). *Journal of the American Chemical Society;* **109**: No. 2, 408-416(21 Jan 1987).

The authors have recently undertaken an investigation of the spectroscopic, magnetic, photophysical, and photochemical properties of a large number of derivatives of the $M_2X_4L_4$ type (M = Mo, W; X = Cl, Br, I; L = uncharged σ-donor ligand), which form one of the largest subclasses of quadruply bonded dimers. One of the more striking findings of these studies is that parameters such as ($\delta \rightarrow \delta^*$) transition energies, electronic absorption and emission band shapes and intensities, and the rates of radiative and nonradiative excited state decay, which are properties associated with the formally metal-metal-localized manifold of electronic states, display a marked sensitivity to the nature of ligands X and L. In order to determine whether this ligand dependence is also reflected in the ground-state properties of these complexes, as well as to provide a structural benchmark for analyzing ligand perturbations of their excited states, they determined the crystal structures of two such derivatives, $Mo_2Br_4(PMe_3)_4$ and $Mo_2I_4(PMe_3)_4$, and the vibrational and electronic spectra of a series of $M_2X_4L_4$ complexes. These results are reported herein, along with a general interpretation of the ligand sensitivity of the energies and intensities of the ($\delta \rightarrow \delta^*$) transitions of quadruply bonded dimers.

16411 **ESR studies on the radical cation mechanism of the ring opening of cyclopropylamines.** Qin, X.; Williams, F. (Univ. of Tennessee, Knoxville). *Journal of the American Chemical Society;* **109**: No. 2, 595-597(21 Jan 1987).

Cyclopropylamine radical cations have been implicated in the mechanism of inactivation of monoamine oxidase and cytochrome P-450 by cyclopropylamines. The key step in the proposed mechanism is illustrated for the parent compound in Scheme I and consists of the ring opening of the aminium radical cation 1 to the carbon-centered radical 2 which subsequently attacks the active site of the enzyme. Here they present ESR evidence for this ring-opening reaction and report that 2 is not converted to the nitrogen-centered radical 3 whereas the corresponding reaction for the neutral radical proceeds to completion at similar temperatures. These results provide a firm basis for the radical cation mechanism of enzyme inactivation, in keeping with the structural evidence that the inactivator is bound to the enzyme through carbon rather than nitrogen.

16412 **Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ (X^- = IBr_2^-, AuI_2^-, I_3^-).** Whangbo, M.; Williams, J.M.; Schultz, A.J.; Emge, T.J.; Beno, M.A. (North Carolina State Univ., Raleigh). *Journal of the American Chemical Society;* **109**: No. 1, 90-94(7 Jan 1987). Contract W-31-109-ENG-38;FG05-86ER45259.

On the basis of the crystal structures of β-$(ET)_2X$ (X^- = IBr_2^-, AuI_2^-, I_3^-) determined at low temperature under ambient and applied pressure, they examined the structural factors responsible for the occurrence of the structural modulation in β-$(ET)_2I_3$ under ambient pressure, its disappearance under pressure greater than $\sim$ 0.5 kbar, and its effect on the superconducting transition temperature T/sub c/ and the dependence of T/sub c/ on anion X^- in β-$(ET)_2X$. ET is an abbreviation for BEDT-TTF, i.e., bis(ethylenedithio)tetrathiafulvalene. The electron-phonon coupling constants, λ, calculated for β-$(ET)_2X$ on the basis of the McMillan equation suggest that the lattice softness with respect to translational and/or librational modes of vibration increases in the order β-$(ET)_2I_3$ < β-$(ET)_2IBr_2$ < β-$(ET)_2AuI_2$ < β^*-$(ET)_2I_3$, where β^*-$(ET)_2I_3$ refers to the β-$(ET)_2I_3$ salt under an applied pressure greater than $\sim$ 0.5 kbar with T/sub c/ similarly ordered 8 K. They also discuss the importance of hydrogen...anion interactions in understanding the lower T/sub c/ values (1-1.5 K) of the other class of organic superconductors $(TMTSF)_2X$ (X^- = ClO_4^-, PF_6^-) compared to the β-$(ET)_2X$ systems and the implications concerning the synthesis of new organic superconductors.

16413 **Synthesis, characterization, and reactivity of α-ketoacyl complexes of platinum(II) and palladium(II). Crystal structures of trans-$Pt(PPh_3)_2(Cl)(COCOPh)$ and cis-$Pt(PPh_3)_2(COPh)(COOMe)$.** Sen, A.; Chen, J.T.; Vetter, W.M.; Whittle, R.R. (Pennsylvania State Univ., University Park). *Journal of the American Chemical Society;* **109**: No. 1, 148-156(7 Jan 1987). Contract FG02-84ER13295.

The α-ketoacyl chloro complexes, trans-$M(PPh_3)_2(Cl)(COCOR)$ (M = Pt: R = Ph, 1a; R = p-FC_6H_4, 1b; R = p-ClC_6H_4, 1c; R = p-MeC_6H_4, 1d; R = Me, 1e. M = Pd: R = Ph, 2), were synthesized by the oxidative addition of the appropriate α-ketoacyl chloride with either $Pt(PPh_3)_4$ or $Pd(PPh_3)_4$. The crystal structure of 1a showed a square-planar geometry around the Pt with the two carbonyl groups virtually coplanar and in an s-trans configuration. The above compounds were found to decompose thermally to the corresponding benzoyl compounds, trans-$M(PPh_3)_2(Cl)(COR)$. A detailed kinetic study of the decarbonylation of 1a and 2 indicated the presence of two competing pathways, one of which involved the initial dissociation of a PPh_3 ligand. The kinetic and thermodynamic parameters for the various steps in the mechanism were determined.

16414 **σ bond metathesis for C-H bonds of hydrocarbons and Sc-R (R = H, alkyl, aryl) bonds of permethylscandocene derivatives. Evidence for noninvolvement of the π system in electrophilic activation of aromatic and vinylic C-H bonds.** Thompson, M.E.; Baxter, S.M.; Bulls, A.R.; Burger, B.J.; Nolan, M.C.; Santarsiero, B.D.; Schaefer, W.P.; Bercaw, J.E. (California Institute of Technology, Pasadena). *Journal of the American Chemical Society;* **109**: No. 1, 203-219(7 Jan 1987). Contract FG03-85ER13431.

The authors report herein synthetic and structural studies of hydride and hydrocarbyl derivatives of permethylscandocene, together with investigations of their reactivities with H_2 and hydrocarbons. Experiments designed to probe the mechanism of these processes have been carried out, and the possibility of involvement of the π system in electrophilic activation of aromatic and vinylic C-H bonds has been examined. A picture of the transition state for such σ-bond metathesis reactions is developed, which accounts for the relative reactivities of sp-, sp^2-, and sp^3-hybridized C-H bonds with Cp^*_2Sc-R (R = H, alkyl, aryl).

16415 **Facile reductive cleavage of the C=O bond of acyl halides and the C identical with N bond of nitriles by hydrogen in the presence of sulfido-bridged molybdenum complexes.** Coons, D.E.; Laurie, J.C.V.; Haltiwanger, R.C.; DuBois, M.R. (Univ. of Colorado, Boulder). *Journal of the American Chemical Society;* **109**: No. 1, 283-285(7 Jan 1987).

The authors have recently reported that cationic dinuclear molybdenum complexes of the type $[(CpMo)_2(S_2CH_2)(\mu\text{-}S)(\mu\text{-}SR)]^+$ undergo unusual reactions with molecular hydrogen to form protons and types of molybdenum and organic products which vary depending on the nature of R. They report here extensions of this reactivity which result in the reductive cleavage of the C=O and C identical with N bonds in acyl halides and nitriles, respectively, under mild homogeneous conditions.

16416 **Ambient-pressure organic superconductor.** Williams, J.M.; Wang, H.H.; Beno, M.A. (to Dept. of Energy, Washington, DC). US Patent 4,632,776. 30 Dec 1986. Filed date 18 Apr 1986. vp.

A superconductor is described comprising a first layer of a compound with superconductor properties having the formula (ET)/sub 2/MX/sub 2/ where ET is bis(ethylenedithio)tetrathiafulvalene. M is a metal, X is a halide, and MX/sub 2/ is symmetrical. The superconductor also comprises a second supporting layer of a conductive metal.

16417 **Estimated core electron binding energies and their application in the interpretation of valence ionization potentials.** Jolly, W.L. (Lawrence Berkeley Lab., CA). *Journal of Physical Chemistry;* 90: No. 26, 6790-6793(18 Dec 1986). Contract AC03-76SF00098.

Empirical group shifts for estimate of the core electron binding energies of compounds of 14 elements are evaluated. It is shown, for elements of the first row of the periodic table, that simple one-parameter groups shifts are inadequate for estimating core binding energies of highly positively charged atoms with polarizable ligands. In the case of carbon 1s binding energies, a method involving two parameters - an electronegativity parameter and a polarizability parameter - is devised which significantly improves the accuracy of the predictions. The nitrogen 1s binding energies of the aminoboranes, NH_2BH_2, $N(CH_3)_2BF_2$, $NH(CH_3)BF_2$, and NH_2BF_2, are estimated. These data, when combined with the nitrogen pπ ionization potentials, lead to the conclusion that there is an important degree of N-B π bonding in all of these molecules.

16418 **Preparation of 1,1'-dinitro-3,3'-azo-1,2,4-triazole.** Lee, K.Y. (to Dept. of Energy, Washington, DC). US Patent 4,623,409. 18 Nov 1986. Filed date 5 Mar 1985. vp.

This patent describes a composition of matter which comprises 1,1'-dinitro-3,3'-azo-1,2,4-triazole.

16419 **Micromixing and multiple steady state transitions in a CSTR.** Puhl, A.; Nicolis, G. (Universite Libre de Bruxelles, Belgium). *Chemical Engineering Science;* 41: No. 12, 3111-3117(1986). Contract AS05-81ER10947.

Using the micromixing concept introduced by Zwietering they describe the effect of incomplete stirring on consecutive reactions exhibiting bistability transitions in a CSTR. In particular they explain the difference in the behavior of the system when reactant feed streams are premixed or non-premixed. A perturbation expansion around the fast stirring limit provides analytical results.

4004 Electrochemistry

16420 **(DOE/ER/10694—1-Final) The cogeneration of electrical energy and useful chemicals in a solid electrolyte reactor [Final technical report].** (Massachusetts Inst. of Tech., Cambridge (USA)). 1 Dec 1986. Contract AC02-80ER10694. 87p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87003413.

Zirconia-yttria solid electrolyte electrochemical reactors with platinum electrodes were investigated for the co-production of electrical energy and useful chemicals, specifically butadiene, styrene and nitric oxide. 54 refs., 43 figs., 1 tab.

16421 **Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes.** DuBois, D.L.; Miedaner, A. (Solar Energy Research Institute, Golden, CO). *Journal of the American Chemical Society;* 109: No. 1, 113-117(7 Jan 1987).

The preparation and characterization of complexes of the type $[M(triphos)L](BF_4)_2$ are described (for M = Ni, L is $P(OMe)_3$ and PEt_3; for M = Pd, L is CH_3CN, $P(OMe)_3$, PEt_3, $P(CH_3OH)_3$, and PPh_3; for M = Pt, L is PEt_3; triphos is $PhP(CH_2CH_2PPh_2)_2$). On the basis of cyclic voltammetry and bulk electrolysis experiments, the Pd complexes are shown to catalyze the electrochemical reduction of CO_2 to CO in acidic acetonitrile solutions. The analogous Ni and Pt complexes are not catalysts for CO_2 reduction under the same conditions. Kinetic studies have been carried out on $[Pd(triphos)(PEt_3)](BF_4)_2$ and a mechanism for the reduction of CO_2 is proposed.

16422 **Process for measuring degradation of sulfur hexafluoride in high voltage systems.** Sauers, I. (to Dept. of Energy, Washington, DC). US Patent 4,633,082. 30 Dec 1986. Filed date 23 Apr 1985. vp.

A process is described for detecting by-products from electrically induced degradation of SF/sub 6/ in high voltage systems comprising: at a pressure within the reaction cell sufficient to cause electron attachment to SF/sub 6/, placing an SF/sub 6/ gas to be tested in an ion-molecule reaction cell having a cathode at a first end, an anode opposite the cathode at a second end, a pin hole aperture incorporated into the anode that opens into a negative ion mass spectrometer that is at a lower pressure than is the reaction cell; producing thermal electrons at the cathode thereby ionizing molecules of the SF/sub 6/ gas in the vicinity of the cathode to form SF/sub 6//sup -/ ions; applying an electrical field in the reaction cell to induce the transfer of the SF/sub 6//sup -/ ions from the cathode to the anode resulting in the formation of by-product ions from intervening by-product molecules having a high affinity for fluoride ions; introducing a combination of the SF/sub 6//sup -/ ions and the by-product ions into the pin hole aperture thereby effecting flow of the combination of ions from the reaction cell to the negative ion mass spectrometer; and detecting the by-product ions using negative ion mass spectrometry techniques.

REFER ALSO TO CITATION(S) 16351, 16373, 17078, 17082

16423 **(DOE/ER/13247—3) Reversible and irreversible redox series as probes of fundamental aspects of charge transfer across InP, WSe_2, and SnS_2/acetonitrile interfaces: Progress report, May 15, 1986-May 14, 1987.** Koval, C. (Colorado Univ., Boulder (USA)). Dec 1986. Contract FG02-84ER13247. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003994.

Kinetics at metal electrode/solution interfaces has been studied for decades and the understanding of electron transfer processes is relatively mature. Despite numerous experimental studies during the past 10 years, many fundamental questions regarding redox processes at semiconductor/liquid junctions, even in the absence of light, remain unanswered. We have attempted to resolve some of these questions by making measurements that are analogous to those that were crucial for detailed understanding of electrochemistry at metals. The key aspects of our semiconductor studies are: (1) use of semiconducting materials and surface preparations that result in reproducible and stable interfacial energetics; (2) using both p- and n-type electrodes with a wide range of doping densities; (3) use of nonaqueous solvents to minimize surface corrosion processes; (4) thorough characterization of the interfacial energetics by measuring the capacitance of the space charge region over the same regions of electrode potential used in voltammetric experiments; and (5) use of substituted metallocenes as solution redox probes in order to insure $1e^-$, outer-sphere reactions with varying reduction potentials yet constant reorganization energies. 22 refs., 3 figs., 2 tabs.

16424 **Formation of long carbon chain molecules during laser vaporization of graphite.** Heath, J.R.; Zhang, Q.; O'Brien, S.C.; Curl, R.F.; Kroto, H.W.; Smalley, R.E. (Rice Univ., Houston, TX). *Journal of the American Chemical Society;* 109: No. 2, 359-363(21 Jan 1987).

Graphite is laser vaporized into a He carrier gas containing various simple molecules such as H_2, H_2O, NH_3, and CH_3CN, supersonically expanded, and skimmed into a molecular beam, and the beam is interrogated by photoionization time-of-flight mass spectrometry. Without added reactants in the He carrier gas, C/sub n/ species up to n = 130 are readily observed. Two distributions separated at about n = 40 appear to be present with the low n species the focus of this work. In the presence of added reagents, new species appear as a result of reaction. These are satisfactorily explained on the basis that a significant proportion of the C/sub n/ species initially formed are reactive radicals with linear carbon chain structures which can readily add H, N, or CN at the ends to form relatively stable polyynes or cyanopolyynes. Some of the cyanopolyynes detected have also been observed in the interstellar medium, and circumstellar carbon condensation processes in the atmospheres of carbon-rich stars similar to those studied here are suggested as possible synthetic sources.

16425 **Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens.** Hurst, J.K.; Thompson, D.H.P.; Connolly, J.S. (Oregon Graduate Center, Beaverton). *Journal of the American Chemical Society;* 109: No. 2, 507-515(21 Jan 1987). Contract AC06-83ER13111.

Triplet state lifetimes of several photoredox-active anions were shortened by adding N-alkyl-N-methyl-4,4'-bipyridinium (C/sub n/MV^{2+}) ions in the presence of dihexadecyl phosphate (DHP) vesicles. Optical spectroscopic measurements indicate that the predominant reaction mechanism is one-electron oxidative quenching. For [5,10,15,20-tetrakis(4-sulfonatophenyl)porphinato]zinc(II) ($ZnTPPS^{4-}$) ion, yields of charge-separated product ions are high, so that overall quantum yields exceeding 0.5 redox pairs per photon absorbed can be realized; for tetrakis(diphosphito)diplatinate(II), tris(4,7-bis(4-sulfonato-benzyl)-1,10-phenanthroline)ruthenate(II), and tris(4,4'-dicarboxylato-2,2'-bipyridine)ruthenate(II) yields are markedly less, a consequence of their shorter intrinsic triplet lifetimes and poor cage escape yields. In the absence of vesicles, product formation is negligible because ion pairing of viologens with sensitizers is extensive, giving rise to static quenching of the photoexcited states. The ionic strength dependence of the kinetics of $^3ZnTPPS^{4-}$ ion oxidation by C/sub n/MV^{2+}-DHP particles suggests a diffusion-controlled mechanism with electron transfer occurring over a distance of separation approximating the hard-sphere collision diameter of sensitizer and viologen.

16426 **Proximity effect in molecular photophysics: dynamical consequences of Pseudo-Jahn-Teller interaction.** Lim, E.C. (Wayne State Univ., Detroit, MI). *Journal of Physical Chemistry;* 90: No. 26, 6770-6777(18 Dec 1986).

The authors present here photophysical properties of nitrogen-heterocyclic and aromatic carbonyl compounds that can be attributed to vibronic coupling between nearby $n\pi^*$ and $\pi\pi^*$ states (proximity effect). These compounds often exhibit luminescence (fluorescence and/or phosphorescence) that is strongly dependent upon temperature, the nature of the solvent, chemical substitution, and the position of the deuterium substitution. Many of these complexities can be traced to the vibronic interaction between closelying $n\pi^*$ and $\pi\pi^*$ states, which leads to a large increase in the nonradiative decay rate of the lowest excited state. This phenomenon, which they have termed proximity effect, has been a subject of extensive studies in recent years, and there is now compelling evidence that the photophysical behavior of the lowest excited state in these molecular is strongly influenced by the proximity effect.

16429 **(EUR—10444) Chemical behaviour of Np, Pu and Am in various concentrated salt solutions.** Kim, J.I.; Apostolidis, C.; Buckau, G. (Commission of the European Communities, Luxembourg). 1986. 128p. (In German). NTIS (US Sales Only), PC A07/MF A01. File Number DE87750586.

The chemical behaviour of Np, Pu and Am in various brine solutions has been investigated. The study deals with important basic chemical processes, i.e. solubility, hydrolysis reaction, complexation, redox reaction, colloid generation. The nuclides used are ^{237}Np, ^{238}Pu, ^{239}Pu and ^{241}Am in the form of oxide or/and hydroxide, whereas the saline solution comprises are NaCl-solution of different concentration (0.1 approximately 5 M), Na3γ-salt solution, quinary solution (Q) and saline groundwaters from Gorleben. This paper reports equilibrium solubilities of the nuclides under varying geochemical parameters, Ph, Eh and CO_2; thermodynamic constants of hydrolysis reactions of NpO^+_2, Pu^{4+}, PuO^{2+}_2, Am^{3+} and AmO^+_2 ions; colloid generation and characterization; speciation; alpha radiolysis effect on dissolution. Complexation and kinetics of redox reactions are only being referred to earlier or on-going works. The speciation has been conducted for relatively higher concentrations by spectrophotometry and for very dilute solutions by laser induced photoacoustic spectroscopy (LPAS). Based on the results from this work and on the literature data, the speciation diagrams of pH-Eh correlation are produced for each element. 66 refs.

16430 **(KFK—4134) Analytical instruments at the Institute of Radiochemistry.** Coerdt, W.; Gantner, E.; Gilbert, E.; Guesten, H.; Klewe-Nebenius, H.; Mainka, E.; Niekusch, E.; Noppel, E.; Ruf, H.; Schoof, S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Radiochemie). Aug 1986. 68p. (In German). NTIS (US Sales Only), PC A04/MF A01. File Number DE87750517.

The analytical instruments available at the Institute of Radiochemistry of the Nuclear Research Center Karlsruhe are described. Important instrumental parameters as well as the methods of preparation and measurement are discussed and examples of typical applications from the field of work of the Institute are given.

16431 **(RCM—02286) Chemical behaviour of plutonium in natural aquatic systems: Hydrolysis, carbonate complexation and redox reactions.** Lierse, C.; Kim, J.I. (Technische Univ. Muenchen, Garching (Germany, F.R.). Inst. fuer Radiochemie). Jun 1986. 245p. (In German). NTIS (US Sales Only), PC A11/MF A01. File Number DE87750522.

The hydrolysis reactions of Pu(IV) and Pu(VI) and the carbonate complexation of Pu(IV) have been investigated by solubility experiments and spectrophotometric measurements. Stability constants are determined for the complexes: Pu(OH)/sub x//sup 4-x/, PuO/sub 2/(OH)/sub x//sup 2-x/ and Pu(OH)/sub x/(CO/sub 3/)/sub y//sup 4-x-2y/. The formation of polymeric as well as colloidal species in solution is identified spectroscopically with the aid of ultrafiltration. The redox behaviour of Pu(III), Pu(IV), Pu(V) and Pu(VI) in carbonate solution has been studied by spectrophotometry and differential pulse polarography, and kinetic data are determined for the disproportionation of Pu(V) as well as the autoreduction of Pu(VI). Based on the redox potential of the couple Pu(VI)/Pu(V) in 1 M Na/sub 2/CO/sub 3/, the stability constant of the complex PuO/sub 2/(CO/sub 3/)/sub 3//sup 5-/ is evaluated. The results from the present work are compared with all those data known hitherto in the literature.

16432 **Studies of the chemical behavior of carrier-free / sup 68/Ge. Pt. 3. Adsorptive properties.** Mirzadeh, S.; Kahn, M. (Brookhaven National Lab., Upton, NY, USA. Medical Dept.; New Mexico Univ., Albuquerque, USA. Dept. of Chemistry). *Radiochimica Acta;* 39: No. 4, 189-194(1986). Contract AC02-76CH00016.

The adsorption of carrier-free /sup 68/Ge on various surfaces was studied 1. in dilute HCl (< 0.1 M), neutral, and basic (< 0.1 M) solutions, 2. in strong acidic solutions (> 6 M), and 3. in moderately acidic solutions (0.1 to 5 M) in the presence of sulfide ion. The adsorbent surfaces included Pyrex, quartz, Teflon, polyethylene, powdered glass, platinum foil, hydrated metal oxides, colloidal sulfur, and performed acid insoluble sulfides.

4008 Combustion, Pyrolysis, And High-temperature Chemistry

16433 (N—87-11960) Simulations of turbulent mixing and reacting flows and their applications to turbulence modeling. Semiannual progress report. Ferziger, J.H.; Cantwell, B.J. (Stanford Univ., CA (USA)). Jul 1986. 21p. (NASA-CR—179829; NAS—1.26:179829). NTIS, PC A02/MF A01.

The method of full simulation is applied to reacting turbulent flows. Full simulation has proven of great value as a complement to experiments for the study of nonreacting turbulent flows. It provides insight into the physics of turbulent flows and their modeling. It is natural to try to extend these methods to the simulation of reacting turbulent flows. Because this is one of the first attempts at this type of simulation, a subsidiary goal of this work is to demonstrate the feasibility of using simulation to study turbulent reacting flows. In addition, it is shown that such simulations can be used to provide physical insight into the nature of turbulent combustion and to provide data that will help to construct models that can be used in engineering simulations of turbulent reacting flows.

16434 Conditional sampling for fuel and soot in CARS thermometry. Eckbreth, A.C.; Anderson, T.J.; Dobbs, G.M. (United Technologies Research Center). pp 16 of Proceedings of the 21st symposium (international) on combustion. Pittsburgh, PA; Combustion Institute (1986). (CONF-860804—).

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

Soot production in propulsion and automotive powerplants is highly undesirable from both durability and emissions standpoints. Laser diagnostic techniques offer the potential for increasing the level of fundamental understanding required to implement successful soot reduction strategies. Temperature plays a key role in both the particle formation and burnout stages. In the time varying environments typical of all practical combustion devices, it is desirable to tag each temperature measurement as to whether the measurement emanates from a fuel rich or soot laden region. Such a conditionally-sampled temperature pdf should expedite insight into the fundamental sooting behavior of practical flames. For practical flames, coherent anti-stokes Raman spectroscopy (CARS) is the preferred approach to nonintrusive, spatially and temporally-precise temperature and major species concentration measurements. In this paper, the authors formulate and experimentally explore various "conditional sampling" strategies to simultaneously sense for fuel and soot presence when performing N/sub 2/ CARS thermometry in turbulent, soot forming flames. Soot sensing strategies are based upon spectroscopic detection of the C/sub 2/ produced during the laser vaporization of the particles; both incoherent and coherent strategies are investigated. Fuel presence is sensed through coherent wave mixing in the fuel or major fuel pyrolysis products. Many of the strategies formulated exploit the newly developed dual broadband Stokes approach to CARS which permits measurements from a number of constituents simultaneously.

16435 The reaction of atomic hydrogen with the formyl radical. Harding, L.B.; Wagner, A.F. (Argonne National Lab., Argonne, IL). pp 29 of Proceedings of the 21st symposium (international) on combustion. Pittsburgh, PA; Combustion Institute (1986). (CONF-860804—). Contract W-31-109-ENG-38.

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

The addition and abstraction reaction pathways on the potential surface of H + HCO have been characterized by an ab initio four electron, complete active space, self-consistent field electronic structure calculation. The elimination pathway to go from the excited adduct H/sub 2/CO* to products H/sub 2/ + CO has been characterized previously. All the theoretical information is used in variational transition state theory and RRKM calculations to determine a rate constant as a function of temperature and pressure. The room temperature calculated value is inconsistent with the earliest and highest experimental value but falls only slightly below the error bars of the two other and more recent experimental measurements. The results indicate that abstraction is the dominant process, followed by addition-elimination. Pressure-induced stabilization of the H/sub 2/CO* adduct is calculated to be quite minor in Ar buffer gas up to 1 atm. However up to a 40% change in the room temperature rate with a pressure change of from 10 to 760 torr is predicted for more efficient buffer gases such as CH/sub 4/. Experimental measurements to date have been too imprecise (errors of at least +- 20%) to detect such a pressure dependence.

16438 (BARC—1301) Cryogenic regenerators. (Bhabha Atomic Research Centre, Bombay (India)). 1986. 54p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87701264.

Importance of regenerators in cryogenic refrigerators is highlighted. Design aspects of regenerator are reviewed and the factors involved in the selection of regenerator material are enumerated. Various methods used to calculate the heat transfer coefficient and regenerator effectiveness are mentioned. Variation of effectiveness with various parameters is calculated by a computer programme using the ideal, Ackermann and Tipler formulae. Results are presented in graphical form. Listing of the computer programme is given in the Appendix. 22 refs., 14 figures.

16439 (BARC—1305) Pool type liquid helium cryopump. (Bhabha Atomic Research Centre, Bombay (India)). 1986. 27p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701268.

Design and fabrication details of a pool type Liquid Helium Cryopump are described. It has got a liquid helium capacity of 5 litres and a/ pumping surface area of about 450 sq. cms. Three

types of baffles having different geometries are used for radiation shield. Effect on pumping speed for argon, carbon dioxide and nitrogen gas using the baffles is determined at various pressures. The circular array baffle geometry provides the maximum pumping speed. Using circular array type baffle the maximum pumping speed for nitrogen, argon and carbon dioxide are 2700 1/s, 3600 1/s, 2550 1/s respectively at a pressure of 6.0 x 10/sup -4/ torr. The ultimate pressure obtained is 3.0 x 10/sup -8/ torr. 16 refs., 6 tables, 5 figures.

16440 **(CONF-870134—1) 3-D world modeling with updating capability based on combinatorial geometry.** Goldstein, M.; Pin, F.G.; de Saussure, G.; Weisbin, C.R. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 11p. NTIS, PC A02. File Number DE87004257.

From Workshop on space telerobotics; Pasadena, CA, USA (20 Jan 1987).

This paper describes a 3-D world modeling technique using range data. Range data quantify the distances from the sensor focal plane to the object surface, i.e., the 3-D coordinates of discrete points on the object surface are known. The approach proposed herein for 3-D world modeling is based on the Combinatorial Geometry (CG) Method which is widely used in Monte Carlo particle transport calculations. First, each measured point on the object surface is surrounded by a small sphere with a radius determined by the range to that point. Then, the 3-D shapes of the visible surfaces are obtained by taking the (Boolean) union of all the spheres. The result is an unambiguous representation of the object's boundary surfaces. The "pre-learned" partial knowledge of the environment can be also represented using the CG Method with a relatively small amount of data. Using the CG type of representation, distances in desired directions to boundary surfaces of various objects are efficiently calculated. This feature is particularly useful for continuously verifying the world model against the data provided by a range finder, and for integrating range data from successive locations of the robot during motion. The efficiency of the proposed approach is illustrated by simulations of a spherical robot in a 3-D room in the presence of moving obstacles and inadequate prelearned partial knowledge of the environment.

16441 **(CONF-870301—6) Evaluating telerobotics for battlefield support operations.** Hamel, W.R.; Richardson, B.S.; Killough, S.M. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 8p. NTIS, PC A02/MF A01. File Number DE87003005.

From International topical meeting on remote systems and robotics in hostile environments; Pasco, WA, USA (29 Mar 1987).

A general-purpose mobile robotics and teleoperations testbed is being developed for studying the application of telerobotics on the battlefield. The system, which will provide effective teleoperation capability and task-dependent, selectable robotic functions, will be used to address the functional feasibility of mobile telerobotics technology with emphasis on soldier-machine interface issues and allocation of operator control functions.

16442 **(EUR—10107) Survey of existing literature in the field of shock-absorbing materials with a view to subsequent adaptation of plastic deformation codes. Phase 1.** Draulans, J.; Fabry, J.P.; Lafontaine, I.; Richel, H.; Guyette, M. (Commission of the European Communities, Luxembourg). 1985. 88p. NTIS (US Sales Only), PC A05/MF A01. File Number DE87750552.

Shock-absorbing materials and structures can be used as part of the transport container structure or of the truck equipment. An extensive survey of the literature has provided much information. Investigation has been made to define the required experimental procedures necessary to measure the missing material properties. Three codes had been selected: EURDYN, MARC-CDC and SAMCEF. For code evaluation, a schematic container model has been considered to serve as a benchmark for the evaluation of plastic deformation. For the shock-calculation, the container falls from a height of 9 meters along the direction of its cylinder axis on an unyielded flat surface. The EURDYN computer code, has been selected first as it is especially designed to handle dynamic problems, preferably plastic ones. Indeed, EURDYN uses an explicit integration scheme versus time, which makes it quite efficient to run short deformation processes such as absorber collapses. The SAMCEF computer code could not readily calculate the benchmark, also a visco-plastic flow model has been added to it. The MARC computer code was supposed to be a candidate to run shock-calculation but extensive computing time and engineering efforts would be required, it was replaced by the PLEXUS code. The results obtained using the SAMCEF programme confirm those obtained with EURDYN. The PLEXUS results are in between. The proposed benchmark calculation is at the border of the capabilities of the most advanced computer codes for plastic-dynamic calculations. Indeed, a complex energy absorption process seems to take place in a narrow region, moving versus time, where very large shape inversions occur. That requires an accurate modelling of the system in the deformed regions and a skilful choice of the numerical parameters of the computer run. The three tested codes gave qualitatively consistent results and confirm some scarce experimental results.

16443 **(N—87-11965) Losses in fountain-effect pumps.** Kittel, P. (National Aeronautics and Space Administration, Moffett Field, CA (USA). Ames Research Center). Apr 1986. 9p. (NASA-TM—88232; A—86184; NAS—1.15:88232). NTIS, PC A02/MF A01.

Three loss mechanisms in fountain-effect pumps are identified and analyzed. Two of these mechanisms reduce the mechanocaloric effect, by reducing the mass transferred per unit heat input. The first loss mechanism of these losses is the result of normal fluid leakage through the pump. The second loss mechanism is the result of the finite separation between the porous plug and the heater. The third loss mechanism reduces the thermomechanical effect. It results from the Gorter-Mellink interaction within the porous plug. All three of these loss mechanisms are shown to reduce pump efficiency. They are then applied to an example to illustrate the relative significance of the three mechanisms.

16444 **(N—87-12018) User manual for BUNVIS-RG: an exact buckling and vibration program for lattice structures, with repetitive geometry and substructuring options.** Anderson, M.S.; Williams, F.W.; Banerjee, J.R.; Durling, B.J.; Herstrom, C.L.; Kennedy, D.; Warnaar, D.B. (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Nov 1986. 50p. (NASA-TM—87669; NAS—1.15:87669). NTIS, PC A03/MF A01.

A computer program is described which is especially suited for making vibration and buckling calculations for prestressed lattice structures that might be used for space application. Structures having repetitive geometry are treated in a very efficient manner. Detailed instructions for data input are given along with several example problems illustrating the use and capability of the program.

16445 **(SAND—86-1907C) Graphics NC generation in a prototype machining laboratory: CAM report.** Burd, W.C. (Sandia National Labs., Albuquerque, NM (USA)). 1986. Contract AC04-76DP00789. 40p. (CONF-8610203—1). NTIS, PC A03/MF A01. File Number DE87002494.

From CIM SUBWOG 39E meeting; Aldermaston, UK (6 Oct 1986).

We present the current and planned use of CAD/CAM tools at the Sandia National Laboratories (Albuquerque) in the prototype NC machining laboratory. We concentrate on the requirement of flexibility and the application of ANVIL-4000. The presentation includes several examples of parts requiring turning, 3-axis, and multi-axis NC tool paths. The discussion includes conclusions regarding software tools and techniques that have produced good results.

16446 **(SAND—86-2474C) Cask technology program activities.** Allen, G.C. Jr. (Sandia National Labs., Albuquerque, NM (USA)). 1986. Contract AC04-76DP00789. 9p. (CONF-861032—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87001733.

From High level waste business: transportation, storage and disposal; Charleston, SC, USA (19 Oct 1986).

The civilian waste cask technology program consists of five major activities: (1) technical issue resolution directed toward NRC and DOT concerns, (2) system concept evaluations to determine

the benefits of proposals made to DOE for transportation improvements, (3) applied technology and technical data tasks that provide independent information and enhance technology transfer between cask contractors, (4) standards development and code benchmarking that provide a service to DOE and cask contractors, and (5) testing to ensure the adequacy of cask designs. The program addresses broad issues that affect several cask development contractors and areas where independent technical input could enhance the Office of Civilian Radioactive Waste Management goals.

16447 **Computer-aided design of glove boxes and enclosures.** Schlanger, E.H.; Dallal, D.M. (Stearns Catalytic Corp.). *Transactions of the American Nuclear Society;* **53**: 119(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Stearns Catalytic Corporation has been involved in the design of over 500 linear feet of glove boxes and enclosures in the execution of major engineering projects during the past several years. The implementation of a computer aided design (CAD) program, specifically developed for this effort, has dramatically improved the quality of the final product while producing significant cost savings. The CAD program, based on a two-dimensional modeling concept, operates in conjunction with a state-of-the-art interactive computer graphics system.

16448 **PC-class microcomputer experience in radiation protection and shielding analysis at INEL.** Yoon, W.Y.; Parsons, D.K.; Nigg, D.W. (Idaho National Engineering Lab., Idaho Falls). *Transactions of the American Nuclear Society;* **53**: 414-415(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Over the last few years, personal computer (PC)-class microcomputer systems (typified by the 16-bit IBM XT and AT and other comparable machines) have become generally available and relatively inexpensive. These small but powerful machines are capable of, and are currently being widely used for, a large variety of complex scientific and engineering calculations. This trend is expected to continue in the future with the introduction of even more advanced microprocessors and microcomputer systems. This summary covers some of the general characteristics of scientific computing in a PC environment, based on recent experience in PC code development and application at the Idaho National Engineering Laboratory (INEL). In addition, some specific examples of currently operational PC code modules released by INEL for use in the radiation protection and shielding analysis field are discussed.

16449 **Different perspectives on the use of personal computers for technical analyses.** Libby, R.A.; Doherty, A.L. (Battelle Human Affairs Research Center). *Transactions of the American Nuclear Society;* **53**: 415(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Personal computers (PCs) have widespread availability and use in many technical environments. The machines may have initially been justified for use as word processors or for data base management, but many technical applications are being performed and often the computer codes used in these technical analyses have been moved from large mainframe machines. The general feeling in the user community is that the free computer time on these machines justifies moving as many applications as possible from the large computer systems. Many of these PC applications cannot be justified if the total cost of using microcomputers is considered. A Hanford-wide local area network (LAN) is being established which allows individual PCs to be used as terminals to connect to mainframe computers at high data transfer rates (9600 baud). This system allows fast, easy connection to a variety of different computers with a few keystrokes. The LAN eliminates the problem of low-speed communication with mainframe computers and makes operation on the mainframes as simple as operation on the host PC, itself.

16450 **New buildup factor data for point kernel calculations.** Trubey, D.K.; Harima, Y. (Oak Ridge National Lab., TN). *Transactions of the American Nuclear Society;* **53**: 416(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Modern buildup factor data are now available across the whole range of atomic number and source energies, and an accurate fitting function is available to reproduce these data in point kernel calculations on computers of all sizes.

16451 **Future of remote handling.** Grisham, D.L.; Lambert, J.E. (Los Alamos National Lab., NM). *Transactions of the American Nuclear Society;* **53**: 486(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The field of remote handling started with the invention of mechanical master-slave and electromechanical manipulators in the late 1940s and early 1950s. Those developments and that of shielding windows applied in hot cells and bays remain the dominant application of remote handling. The development of electric master-slave manipulators in the 1950s under the direction of Ray Goertz, and further development and applications in accelerator and nuclear fuel reprocessing, has made advanced remote handling a viable scheme for many applications. In very recent times, the application of robotics to analytical chemistry, fuel pellet fabrication, and explosives handling is a precursor to an expanded application of that technology. This paper will review the state-of-the-art in three areas and offer the authors view of the future over approximately the next ten years.

16452 **High-definition television evaluation for remote handling task performance.** Fujita, Y.; Omori, E.; Hayashi, S.; Draper, J.V.; Herndon, J.N. (Pacific Northwest Lab., Richland, WA). *Transactions of the American Nuclear Society;* **53**: 486-488(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In a plant that employs remote handling techniques for equipment maintenance, operators perform maintenance tasks primarily by using the information from television systems. The efficiency of the television system has a significant impact on remote maintenance task performance. High-definition television (HDTV) transmits a video image with more than twice the number of horizontal scan lines as standard-resolution television (1125 for HDTV to 525 for standard-resolution NTSC television). The added scan lines dramatically improve the resolution of images on the HDTV monitors. This paper describes experiments designed to evaluate the impact of HDTV on the performance of typical remote tasks. The experiments described in this paper compared the performance of four operators using HDTV with their performance while using other television systems. The experiments included four television systems: (a) high-definition color television, (b) high-definition monochromatic television, (c) standard-resolution monochromatic television, and (d) standard-resolution stereoscopic monochromatic television.

16453 **Manipulator comparative testing program.** Draper, J.V.; Handel, S.J.; Sundstrom, E.; Herndon, J.N.; Fujita, Y.; Maida, M. *Transactions of the American Nuclear Society;* **53**: 488-489(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The Manipulator Comparative Testing Program compared performance of selected manipulator systems under typical remote handling conditions. The site of testing was the Remote Operations and Maintenance Demonstration Facility operated by the Consolidated Fuel Reprocessing Program of the Oak Ridge National Laboratory. Three experiment examined differences among manipulator systems from the US and Japan. The manipulator systems included the Meidensha BILARM 83A, Central Research Laboratories' (CRL's) Model M-2, and GCA PaR systems Model 6000. Six manipulator and control mode combinations were evaluated: (a) the BILARM in master-slave mode without force reflection; (b) the BILARM in master-slave mode with force reflection; (c) the Model

M-2 in master-slave mode without force reflection; (d) the Model M-2 in master-slave mode with force reflection; (e) the BILARM with switchbox controls; and (f) the PaR 6000 with switchbox controls. The experiments also examined differences between master-slave systems with and without force reflections, and differences between master-slave systems and switchbox-controlled systems.

16454 **Training program requirements for remote equipment operators in nuclear facilities.** Palau, G.L.; Auclair, K.D. (Bechtel, Middletown, PA). *Transactions of the American Nuclear Society;* 53: 494-495(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

One of the most neglected areas in the engineering development of remotely operated equipment applications in nuclear environments is the planning of adequate training programs for the equipment operators. Remote equipment accidents cannot be prevented solely by engineered safety features on the equipment. As a result of the experiences in using remote equipment in the recovery effort at Three Mile Island Unit 2 (TMI-2), guidelines for the development of remote equipment operator training programs have been generated. The result is that a successful education and training program can create an environment favorable to the safe and effective implementation of a remote equipment program in a nuclear facility.

16455 **Use of CADD/CAE for remote vehicle system mission planning.** Auclair, K.D.; Palau, G.L. (Bechtel, Middletown, PA). *Transactions of the American Nuclear Society;* 53: 495-496(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Many factors contribute to the successful completion of a remotely operated vehicle mission. Among the most important is mission planning: a comprehensive evaluation of the objectives of the mission, the equipment and operator capabilities, and the physical constraints within the environment into which the equipment will be deployed. Experience gained during the recovery of Three Mile Island Unit 2 (TMI-2) indicates that computerized design and drafting systems (CADD) can be used as an effective aid in mission planning which can improve the efficiency, quality, and execution of tasks using remote vehicle systems. CADD systems can be utilized for pretask identification of alternative vehicle transit routes, interferences and obstructions to remote equipment movement, identification of landmarks from which the equipment operators can navigate, and operator familiarization with the physical layout and work area constraints. All of this can result in a reduction in the time and cost required to perform a job, and in a nuclear environment can also result in a significant reduction in personnel radiation exposure.

16456 **Tools for decontamination and decommissioning of nuclear facilities.** Hermetz, R.E. (Monsanto Research Corp., Miamisburg, OH). *Transactions of the American Nuclear Society;* 53: 496-497(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The decontamination and decommissioning (D & D) of nuclear facilities requires many different tools. These can vary from small hand tools to the heavy equipment used to remove concrete and soil. Tools for D & D should be reliable, versatile, economical, and easily disposed of in case they become contaminated. The experiences and information used as background for this paper where gained at the Mound Facility of the Monsanto Research Corporation in Miamisburg, Ohio. In the search to find tools to do the work proficiently, many tools were considered. The scheduled D & D tasks and the tools and equipment required for them are described.

16457 **Experience with the Surveyor mobile robot in radioactive work environments.** Kniazewycz, B.G.; Darvish, A.R.; Irving, T.L. (KLM Technologies, Inc., Walnut Creek, CA). *Transactions of the American Nuclear Society;* 53: 497-498(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper summarizes the development and implementation history of the Surveyor mobile robotic device from November 1985 through August 1986. This two-tracked remotely controlled tetherless device is used to conduct surveillance and inspection and light maintenance missions in nuclear power plants. Surveyor's relatively light weight (<400 lb) can easily be transported manually from location to location. The total maximum payload of the device, which is able to climb 40-deg stairs, is up to 300 lb when transported on a level floor. Surveyor can traverse through 14 in. of water and over 9-in.-high obstacles. Standard accessories include radiation detector, humidity monitor, temperature measurement, sound detection and position/ranging, and a standard video or CCD camera having a wide angle and telephoto lens. These devices are mounted on a 3 degree-of-freedom articulated arm with halogen lights.

16458 **Evaluation of glovebox sectioning using weld splitting techniques.** Titzler, P.A.; Allan, C.R. (Westinghouse Hanford, Richland, WA). *Transactions of the American Nuclear Society;* 53: 499-501(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A weld splitting method is being evaluated for sectioning austenitic stainless steel components. Testing consists of sectioning simulated stainless steel gloveboxes to determine the acceptability of using dissimilar metal splitting methods. The weld splitting mechanism, similar to liquid-metal embrittlement, results in a coating of the grain boundaries with a splitting agent such as copper through the material separation path. When copper is brought into contact with stainless steel during a welding operation and a critical stress level is present in the parent metal, the splitting phenomenon occurs. This technique has the advantage of sectioning without producing fines and smoke, and the disturbances to the far side of the material are minimized.

16459 **Interactive animated displayed of man-controlled and autonomous robots.** Crane, C.D. III; Duffy, J. (Univ. of Florida, Gainesville). *Transactions of the American Nuclear Society;* 53: 509-510(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

An interactive computer graphics program has been developed which allows an operator to more readily control robot motions in two distinct modes; viz., man-controlled and autonomous. In man-controlled mode, the robot is guided by a joystick or similar device. As the robot moves, actual joint angle information is measured and supplied to a graphics system which accurately duplicates the robot motion. Obstacles are placed in the actual and animated workspace and the operator is warned of imminent collisions by sight and sound via the graphics system. Operation of the system in man-controlled mode is shown. In autonomous mode, a collision-free path between specified points is obtained by previewing robot motions on the graphics system. Once a satisfactory path is selected, the path characteristics are transmitted to the actual robot and the motion is executed. The telepresence system developed at the University of Florida has been successful in demonstrating that the concept of controlling a robot manipulator with the aid of an interactive computer graphics system is feasible and practical. The clarity of images coupled with real-time interaction and real-time determination of imminent collision with obstacles has resulted in improved operator performance. Furthermore, the ability for an operator to preview and supervise autonomous operations is a significant attribute when operating in a hazardous environment.

16460 **Update on active facilities at Harwell, UK.** Brown, P.E.; Bauer, G.J. (UKAEA, Harwell, England). *Transactions of the American Nuclear Society;* 53: 518-519(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The United Kingdom Atomic Energy Research Establishment at Harwell has an extensive range of active handling facilities that are available for use in support of the various facilities that are available for use in support of the various nuclear programs. Currently the facilities consist of: 1. High-activity handling cells which are heavily shielded concrete cells, capable of handling activities up to 10^6-MeV Ci. 2. Medium- and low-activity cells, which are either

concrete or lead shielded and equipped for mechanical, physical, and chemical examination of radioactive specimens. 3. Micro-handling cells which are equipped for micro-manipulation and detailed optical microscopy, scanning electron microscopy, and electron-probe microanalysis. Recent additions to improve the facilities include the introduction of a double-lidded transfer system to improve containment during posting operations, the introduction of a standard range of transfer flask and transport containers, and the use of circular filters for ease of replacement, disposal, and improved sealing arrangements.

16461 **Posting in/out technique in KfK hot cells.** Enderlein, H. (KfK, Karlsruhe, West Germany). *Transactions of the American Nuclear Society;* **53**: 519-520(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The concrete-shielded hot cells of Kernforschungszentrum Karlsruhe GmbH was constructed in the early 1960's. Over the years it became apparent that the original posting in/out technique, described in the paper, was no longer acceptable. Double lit locks of 500-mm diameter were provided in the cell ceiling hatches and unshielded containers fitting these hatches were procured. These actions led to a reduction in personnel exposure. Improvements made to the new posting in/out system since its implementation are discussed.

4203 Lasers

REFER ALSO TO CITATION(S) 16321, 17060, 17356, 17398, 17558, 17559

16462 **(AD-A—174034/9/XAB) Electron-pumped high-efficiency semiconductor laser.** Daneu; DeGloria, D.P.; Sanchez-Rubio; Tong, F.; Osgood, R.M. (Massachusetts Inst. of Tech., Lexington (USA). Lincoln Lab.). 8 Sep 1986. 4p. (JA—5830). NTIS, PC A02/MF A01.

Electron-beam excitation is a well-known technique for generating stimulated emission in semiconductors. CdS has been among the more-commonly used II-VI compound semiconductors for generating visible laser radiation. Efficiencies approaching the theoretical limit of 30% were first measured in this material at cryogenic temperatures and more recently at room temperature. In general, two categories of devices have been the most extensively investigated: (1) lasers for use in projection television and based on scanned, focused, low-voltage, low-current electron guns, and (2) high-energy pulsed lasers excited by electron beams of large cross-sectional area, high voltage, and high peak current. Published data on the efficiency of the latter type of laser have not so far been attractive enough to warrant extensive development. This document discusses in detail the operation of high-power efficiency (3.5-14%), room-temperature, II-VI lasers pumped by a pulsed electron gun in the 200-300 keV range. High efficiency is obtained by careful optimization of both fabrication procedures and resonator structure.

16463 **(CEA-CONF—8497) Review of X-ray laser research at CEL-V.** Louis-Jacquet, M.; Adolf, A.; Berthier, E. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Apr 1986. 8p. (CONF-8604224—4). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750458.

From International colloquium on X-ray lasers; Aussois, France (14 Apr 1986).

Plasmas generated by laser irradiation of solid targets have demonstrated for a long time their non LTE behavior providing numerous states propitious to population inversions. So studying inversions and X-ray amplification is in keeping with the general pattern of the understanding of the plasma state and more precisely of the involved atomic processes. Moreover the recent fruitful experiments on X-ray amplification have enforced our interest, if it was not, in theoretical and experimental studies in this new field of investigation.

16464 **(CEA-CONF—8498) Ionization model for nickel-like gold.** Busquet, M.; Bruneau, J. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Apr 1986. 7p. (CONF-8604224—5). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750459.

From International colloquium on X-ray lasers; Aussois, France (14 Apr 1986).

Before we build an extensive population model for gold ionized 49 to 52 times, we have studied with a more simple model the effect of accounting for cascades (or dielectronic recombination) and $\Delta n = 0$ transitions. These transitions allow some understanding of typical feature of experimental gold spectra.

16465 **(CEA-R—5359) Bibliographic study of photophysical and photochemical properties of laser dyes.** Doizi, D. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). Jun 1986. 92p. (In French). NTIS (US Sales Only), PC A05/MF A01. File Number DE87750538.

Laser isotope separation of uranium requires high power and precise wave length. This report is a bibliographic and experimental study of the photophysical and photochemical properties of seven commercial laser dyes which have an emission wavelength in the range 5500-6500 A: rhodamine 110 or 560, rhodamine 6G or 590, rhodamine B or 610, rhodamine 101 or 640, sulforhodamine B or kiton red 620, sulforhodamine 101 or 640 and DCM or LC 6500. Absorption and emission cross section values, fluorescence lifetimes and quantum yields in various solvents are indicated. For each dye, a non exhaustive list of laboratory experiments made with two types of pump sources: Nd YAG (532) and copper vapor laser is given. When it is known, the toxicity of the dyes is mentioned.

16466 **(LA-UR—87-83) Plasma energy balance model for optical-laser-induced impulse in vacuo.** Dingus, R.S.; Goldman, S.R. (Los Alamos National Lab., NM (USA)). 1986. Contract W-7405-ENG-36. 13p. (CONF-861177—6). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005113.

From 9. international conference on lasers and applications; Orlando, FL, USA (3 Nov 1986).

A simple plasma-energy-balance model, along with its derivation, is presented for calculating the impulse from targets in a vacuum exposed to single-pulse, optical lasers. Figures demonstrate that throughout most of the range of interest, results from the model agree well with experimental data and LASNEX radiation-hydrodynamic computer code calculations. The model assumes isothermal blowoff and thus takes advantage of the insensitivity of impulse to energy distribution within the ablated mass. The density profile in the blowoff plasma is estimated and the Saha equation is used to evaluate the degree of ionization. The laser absorption coefficient and thermal radiation opacity are evaluated as a function of position in the plasma in order to evaluate the energy reaching the ablation surface. An overall energy balance plus an energy balance at the ablation surface are used to determine the blowoff mass and temperature. The success of the model indicates that the impulse is insensitive to detailed interactions in the vicinity of the ablation surface. 10 refs., 3 figs.

16467 **(SAND—86-2121C) Nuclear reactor excitation of XeF laser gas mixtures.** Rice, J.K.; Hays, G.N.; Neal, D.R.; McArthur, D.A.; Alford, W.J. (Sandia National Labs., Albuquerque, NM (USA)). 1986. Contract AC04-76DP00789. 17p. (CONF-861177—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005060.

From 9. international conference on lasers and applications; Orlando, FL, USA (3 Nov 1986).

Kinetic studies of the XeF laser system and other laser media have been studied under low-power (several kW/cc), long-pulse (100 to 200 microseconds) pumping conditions using fission-fragment pumping. Results include the measurement of fluorescence from excited states of KrF, N_2^+, and XeF and optical gain near 351 nm in gas mixtures containing Xe, NF_3, and a rare gas. Sandia's fast-pulse reactor facility (SPR III) was used for these experiments, in which a cell containing the gas mixtures is irradiated with thermalized neutrons. Energy deposition in the gas occurs through the interaction of energetic charged particles produced by neutron-induced fission events. Two pumping modes have been ex-

amined. One mode uses ^{3}He as the rare gas, where charged particles from the ^{3}He(n,p)^{3}H reaction excite the medium. Another mode uses fission fragments from ^{235}U, which is coated on thin ceramic substrates, as the source of excitation. 7 refs., 10 figs.

16468 **Collective instability of a free electron laser including space charge and harmonics.** Murphy, J.B.; Pellegrini, C.; Bonifacio, R. (Brookhaven National Lab., Upton, NY). *Optics Communications;* 53: No. 3, 197-202(1 Mar 1985). Contract AC02-76CH00016.

The effects of harmonics, space charge and electron energy spread on the collective instability regime of an electron beam coupled to a planar undulator are analyzed. Both analytical and numerical results are presented. 9 references, 5 figures.

16469 **Red laser initiative at Los Alamos.** Barnes, N.P.; Meier, J.V.; Remelius, D.K. (Los Alamos National Lab., P.O. Box 1663, Los Alamos, NM 87545). pp ThA2.1-ThA2.4 of Topical meeting on tunable solid state lasers. Digest of technical papers. Washington, DC; Optical Society of America (1985). (CONF-8505244—).

From Topical meeting on tunable solid state lasers; Arlington, VA, USA (16 May 1985).

Several solid state lasers systems tunable between 0.70 and 0.95 μm have been the subject of studies to identify new lasers for various programs at the Los Alamos National Laboratory. These solid state lasers include Cr:GSGG, Cr:GSAG and Ti:Sapphire. Both laser pumped flashlamp pumped results are described in the following sections.

16470 **Sustained performance of a 100 W, 240 Hz alexandrite laser.** Sam, R.C.; Rapoport, W.R.; Shand, M.L. (Military Laser Products, 31717 La Tienda Drive, Westlake Village, CA 91362). pp FA1.1-FA1.4 of Topical meeting on tunable solid state lasers. Digest of technical papers. The design of a high repetition rate, high power alexandrite laser was presented previously. This paper describes the current configuration and test results of the system.

16471 **Monochromator wavelength measurement device with six figure accuracy.** Barnes, N.P.; Gettemy, D.J.; Hinsley, R.J.; Deal, J.B.; Howell, J.; King, R.L.; Harker, W.C. (Los Alamos National Lab., P.O. Box 1663, Los Alamos, NM 87545). pp FC6.1-FC6.3 of Topical meeting on tunable solid state lasers. Digest of technical papers. Washington, DC; Optical Society of America (1985). (CONF-8505244—).

From Topical meeting on tunable solid state lasers; Arlington, VA, USA (16 May 1985).

This device can measure the output of a laser with an accuracy of about one or two parts in the sixth place. A stabilized ring dye laser was set up and chopped to simulate a pulse laser. The output of the ring dye laser could be read on a commercial wavemeter for comparison. For initial investigation, only one reference laser, the stabilized HeNe, was used. This was used to calculate the intercept while the slope was determined through a calibration procedure. With this arrangement, the readings of this device and the commercial wavemeter agreed to one or two parts in the sixth place across the entire wavelength interval of interest, approximately the accuracy of the commercial wavemeter.

16472 **Transparent glass ceramics: Laser prospects.** Lempicki, A.; Edwards, M.; Beall, G.H.; Hall, D.; Andrews, L.J. (Boston Univ., Chemistry Dept., Boston, MA 02215). pp FA8.1 of Topical meeting on tunable solid state lasers. Digest of technical papers. Washington, DC; Optical Society of America (1985). (CONF-8505244—).

From Topical meeting on tunable solid state lasers; Arlington, VA, USA (16 May 1985).

A study of the luminescence of Cr/sup +3/ in inorganic glasses was first undertaken in order to develop a Luminescent Solar Concentrator. Broad absorption bands and near IR (vibronic) emission made the material promising for the purpose but universally low quantum efficiency (in glasses) negated that goal. Having observed that efficiency in crystals can be high, a development of glass ceramics, or crystallites precipitated in situ in a glassy matrix was undertaken. There is evidence that some of the crystalline phases (such as solid state solutions of Al/sub 2/O/sub 3/ and SiO/sub 4/) offer suitable octahedral sites for Cr/sup 3+/ and cause a migration of Cr from glass into the crystals. This results in greatly increased quantum efficiency. The optical quality of the ceramics is determined by the presence of two phases of slightly different refractive indices. Fortunately the size of the crystallites is much smaller than the wavelength of light, so that scattering is minimized, but its reduction nevertheless represents the main current challenge. Recent work reveals that there may be two categories of sites in mullite ceramics namely those corresponding to well defined crystallographic positions and those which do not. The latter are responsible for the nonexponential decay and the inhomogenious broadening of absorption and emission spectra. Except for absolute values of emission cross sections and excited state absorption, the requirements for an LSC and a laser are almost identical, hence much of the current development is driven by the prospects of a new type of solid state laser system based on these unique, poorly understood, yet promising, materials.

16473 **The influence of a plasma during laser welding.** Dixon, R.D.; Lewis, G.K. (Los Alamos National Lab., P.O. Box 1663, MS G770, Los Alamos, NM 87545). pp 44-50 of Proceedings of the materials processing symposium. Volume 38. Metzbower, E.A. Toledo, OH; Laser Institute of America (1983). (CONF-831195—).

From International congress on applications of lasers and electro-optics; Los Angeles, CA, USA (14 Nov 1983).

High speed movies of single pulse laser welds are correlated with optical emission from the plasma and the acoustic wave to study and model enhanced coupling. The movies and acoustic signals combine to support enhanced coupling through the development of a laser supported combustion wave.

4204 Heat Transfer And Fluid Flow

REFER ALSO TO CITATION(S) 15791, 15792, 15794, 15795, 15835, 15859, 15936, 15937, 15938, 15942, 15943, 15953, 15982, 16433, 16448

16474 **(DOE/PC/90957—T1) Fluidization mechanisms in slurry flows: Quarterly report.** (University of Southern California, Los Angeles (USA)). Jan 1987. Contract FG22-86PC90957. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004507.

The major accomplishment during this quarter was the completion of the design for the slurry test loop. At the present time, all of the parts that require long delivery times have been ordered. The largest problem will be the pump which is scheduled for delivery sometime between March and April. It is anticipated that the construction of the test loop will take at least the next six to nine months depending on the delivery of parts and the availability of machinists and other support personnel. This is exactly on the time line suggested in the proposal. A description of the test loop and a description of the particle pressure transducers are presented in this report. 2 figs.

16475 **(KFK—4094) Velocity and turbulence distributions in wall subchannels of a rod bundle with a spacer grid.** Rehme, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Aug 1986. 88p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE87750505.

Measurements of the mean velocity, of the wall shear stresses, and of the turbulence have been performed in two wall subchannels (P/D=1.223; W/D=1.183) of a rod bundle of four parallel rods arranged in a rectangular channel for three axial planes. For two planes, a spacer grid of the SNR-type was inserted in the rod bundle at ratios of distance between the spacer grid and the measuring plane and the hydraulic diameter of L/D/sub h/ =84.9 and 62.8, respectively. The measurements in the third axial

plane have been performed as a reference experiment at L/D=88.2 without the spacer grid. The Reynolds number of this investigation was Re=1.45x10/sup 5/. The results show that the distributions of the velocity, of the wall shear stresses, and of the turbulence are not completely developed at L/D/sub h/=88.2 for the reference experiment without the spacer grid. The symmetry of the distributions is improved by including the spacer grid in spite of the lower L/D/sub h/-ratio than for the reference experiment.

16476 **(N—87-11963) On the Maxwellian distribution, symmetric form, and entropy conservation for the Euler equations.** Deshpande, S.M. (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Nov 1986. 30p. (NASA-TP—2583; L—16036; NAS—1.60:2583). NTIS, PC A03/MF A01.

The Euler equations of gas dynamics have some very interesting properties in that the flux vector is a homogeneous function of the unknowns and the equations can be cast in symmetric hyperbolic form and satisfy the entropy conservation. The Euler equations are the moments of the Boltzmann equation of the kinetic theory of gases when the velocity distribution function is a Maxwellian. The present paper shows the relationship between the symmetrizability and the Maxwellian velocity distribution. The entropy conservation is in terms of the H-function, which is a slight modification of the H-function first introduced by Boltzmann in his famous H-theorem. In view of the H-theorem, it is suggested that the development of total H-diminishing (THD) numerical methods may be more profitable than the usual total variation diminishing (TVD) methods for obtaining wiggle-free solutions.

16477 **(NP—7770059) Effect of air and water side heat and material transfer conditions on the evaporation cooling in wet cooling towers.** Hauenschild, R. (Technische Univ. Braunschweig (Germany, F.R.). Fakultaet fuer Maschinenbau und Elektrotechnik). 17 Sep 1985. 219p. (In German). NTIS (US Sales Only), PC A10/MF A01. File Number DE87770059.

The heat and material transfer conditions which occur in the process of evaporation cooling on the air and water side are examined in detail in this work. Apart from the theoretical basis for calculating counterflow wet cooling towers, the behaviour of the heat and material transfer coefficients in coupled heat and material transfer is examined. The theoretical dependence on temperature of the Merkel figure is also described and the water side heat transfer resistance in evaporation is examined. Finally, the behaviour of the evaporation coefficient is determined, taking into account the water side heat transfer resistance. (HAG).

16478 **(UCRL—53774) A laser Doppler method for noninvasive measurement of flow velocity.** Biggs, G.L. (Lawrence Livermore National Lab., CA (USA)). 25 Nov 1986. Contract W-7405-ENG-48. 14p. NTIS, PC A02/MF A01. File Number DE87005197.

Laser Doppler velocimetry is a powerful optical technique for noninvasively obtaining experimental flow-velocity data. This paper describes the principle of operation and various optical configurations of the laser Doppler velocimeter. As a sample application, we describe an experimental apparatus for measuring the velocity flow field around a cylinder, and give our experimental results.

16479 **Time-dependent nodal integral methods in linear and nonlinear heat conduction.** Wilson, G.L.; Rydin, R.A.; Azmy, Y.Y. (Univ. of Virginia, Charlotte). *Transactions of the American Nuclear Society;* **53**: 254-255(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The introduction of time dependence to nodal integral method is accomplished by the authors for both the linear heat conduction equation and the nonlinear heat conduction case. Several simple linear test problems with known solutions have been used to verify the accuracy of the method. The method serves as a sound base for continuing into the development of highly accurate time dependent fluid flow methods.

16480 **Finite difference solution procedure for convection-diffusion problems in irregular geometries.** Asfaw, A.; Glakpe, E.K. (Howard Univ., Washington, DC). *Transactions of the American Nuclear Society;* **53**: 257-258(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the present paper a solution method is described for convection-diffusion problems that are described by cylindrical polar coordinates in two-dimensional physical space. A simple algebraic nonorthogonal coordinate transformation is presented that maps a complex fluid domain onto a rectangular plane. In this new plane the transformed governing equations are finite differenced and are solved iteratively by using an implicit cell-by-cell procedure with upwind convective derivatives. As an example, the method is applied to the problem of laminar natural-convection heat transfer from an inner isothermal horizontal square cylinder to an outer concentric circular cylinder which is maintained at a lower but constant temperature. This problem models the fluid dynamics in a nuclear spent-fuel shipping cask in which the inner body represents a light water reactor fuel assembly.

16481 **Discussion of the numerical stability of an improved upwinding scheme.** Hassan, Y.A.; Kim, J.H. (Texas A & M, College Station). *Transactions of the American Nuclear Society;* **53**: 261-263(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The prediction of multidimensional heat transfer and fluid flow problems requires the solution of Navier-Stokes equations. Although the use of upwind approximation for the convection terms removes the potential of nonphysical spatial oscillations, such a procedure is burdened with excessive numerical diffusion. Recently published work by Smith and Hutton presented results for some 20 different candidate methods to estimate the convection terms. The overall conclusion was that none of the methods was totally successful. The more accurate methods exhibited nonphysical spatial oscillations. More recently, a procedure was proposed that alleviates the problem of false diffusion. The purpose of this paper is to present several challenging cases, with various flow orientation, to show that the proposed procedure always circumvents the negative coefficients in the discretization equation such that the influence coefficients cannot become negative. The Smith and Hutton test case has been examined to illustrate the merit of this technique. The results are competitive with a large majority of those examined by Smith and Hutton.

16482 **Two-phase flow demonstration device.** Best, F.R. (Texas A & M, College Station). *Transactions of the American Nuclear Society;* **53**: 55-56(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Teaching two-phase flow is sometimes constrained by the average person's lack of experience with the relevant phenomena. One uses examples of water boiling in a pot, drops of water on a hot griddle, etc., to illustrate various effects; however, these pool-boiling phenomena capture neither the dynamic aspects of two-phase flow nor student interest. In order to overcome this limitation, a low-cost demonstration device has been built to illustrate various two-phase flow situations as part of an introductory two-phase flow course. The purpose of this summary is to describe the device, list the flow regimes that can be created, and relate the student response to its use.

16483 **(JINR—R-7-85-261) Control and data acquisition system of the RIPS facility for the plastic property irradiation studies.** (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1985. 4p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701336.

The multipurpose controle and data acquisition system designed for servicing measuring devices of the RIPS facility is described. The RIPS facility is used to carry out simulating material testing experiments, investigating plastic properties of materials using the JINR heavy ion cyclotron beams. The Z80 microprocessor, being a part of the ZX81 microprocessor, is the central processor of the system. Programming is performed in BASIC or computor code. The given program can be changed operatively in correspondence with experimental requirements. System efficiency is increased at the expence of interfacing existed between the ZX81 and the TRA 11/40 computers. The system has shown high performances. It can be used in experiments, where high rate of data acquisition is not required, and the number of parameters measured does'nt exceed 10. 3 refs.

16484 **(JINR-R—10-85-781) Neutron diffractometer at the IBR-2 reactor. Control system for four-circle goniometer.** Balagurov, A.M.; Barabash, I.P.; Ostrovnoj, A.I.; Shibaev, V.D.; Zastenker, I.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1985. 5p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700808.

The control system for four-circle geniometer are described. It is used with the DN-2 diffractometer for monocrystal orientation. Position of goniometer axes is detemined by an optical-electrical device providing the 0.025 deg accuracy over phi, chi and ω axes and 0.05 deg over 2THETA axis. Control electronics is made in the CAMAC standard and connected with the MERA-60 computer. The control program permits to work with the geniometer in the interactive or automatic regimes. It permits to turn axes on the initial position, on a given angle, to test correctness of movement and to perform some service functions. 5 refs.; 3 figs.

16485 **Characterization of flaws using the zeroes of the real and imaginary parts of the ultrasonic scattering amplitude.** Kogan, V.G.; Hsu, D.K.; Rose, J.H. (Ames Laboratory, Iowa State Univ., Ames, IA). *Journal of Nondestructive Evaluation;* **5**: No. 2, 57-68(Jun 1985).

A new method for determining the size of flaws, such as cracks and voids, in structural materials is reported. The method is based on the observation that, for a wide class of flaws, the zeroes in the real and imaginary parts of the scattering amplitude occur at characteristic frequencies which depend on the flaw size. The method of reconstruction using the zeroes is simpler than the inverse Born approximation because the flaw sizes are extracted directly from the characteristic frequencies. The new method employs the same data input as the inverse Born algorithm and has certain common limitations. Following a theoretical treatment, experimental results are presented for a number of different types of flaws.

16486 **(AD-A—174015/8/XAB) Assessment of silicon-on-insulator technologies for VLSI (very large scale integration).** Tsaur, B.Y. (Massachusetts Inst. of Tech., Lexington (USA). Lincoln Lab.). 1986. 10p. (MS—7019). NTIS, PC A02/MF A01.

A high-performance, cost-effective silicon-on-insulator (SOI) technology would have important near-term applications in radiation-hardened electronics and longer-term applications in submicrometer VLSI. The advantages of SOI over bulk Si technology for these applications are outlined, and CMOS, CJFET, and bipolar device structures being developed for SOI are discussed. The current status and future prospects of the two most promising SOI technologies -- beam recrystallization and high-dose oxygen implantation -- are reviewed, with emphasis on such issues critical to commercialization as material quality and manufacturing feasibility.

16487 **(AD-A—174521/5/XAB) High power, millimeter-wavelength, coherent radiation sources. Final report, 1 February 1982-31 January 1986.** Walsh, J.E. (Dartmouth Coll., Hanover, NH (USA). Dept. of Physics and Astronomy). 25 Sep 1986. 72p. NTIS, PC A04/MF A01.

A summary of the results of the Cherenkov Maser development is presented. During the course of this work, operation over the spectral range extending from just below 30 GHz to just above 300 GHz was demonstrated. Sources based upon high-power microwave-tube technology and sources driven by pulse-power generators were both used to drive Cherenkov Masers. In the former type, 10% efficiency from single-pass, untapered resonators were obtained, while in the latter, efficiency was in the 0.1-1% range. Extensive computer codes describing linear and nonlinear aspects of Cerenkov Maser operation were also developed.

16488 (CONF-8412124—Exc., pp 7-19) **Energy from waste: Is it ecologically acceptable.** Schenkel, W. (Umweltbundesamt, Berlin, Germany, F.R.). Jun 1986. (In German). NTIS (US Sales Only), PC A03. File Number DE87751306.

From Experts discussion on a waste management concept for the south western and southern Palatinate; Pirmasens, F.R. Germany (10 Dec 1984).

Abfallwirtschaft in Rheinland-Pfalz. No. 3.

The author reports on the emissions from waste incineration plants at the example of some hazardous substances in relation to coal firings. Cleaning methods as well as the treatment of waste products for refuse tips or their recycling are dealt with. Ecological points of view must be taken into consideration in accordance with the requirements of the individual cases.

16489 (CONF-8412124—Exc., pp 21-29) **Arguments against energy from waste.** Koch, T. (Institut fuer Energie- und Umweltforschung e.V., Heidelberg, Germany, F.R.). Jun 1986. (In German). NTIS (US Sales Only), PC A03. File Number DE87751306.

From Experts discussion on a waste management concept for the south western and southern Palatinate; Pirmasens, F.R. Germany (10 Dec 1984).

Abfallwirtschaft in Rheinland-Pfalz. No. 3.

According to our present level of knowledge, an energetic utilization of waste products is primarily seen in recycling; the thermical utilization by incineration being only or secondary possibility. The pollution of the air is not likely to be reduced noticeably by operating a refuse-fueled heating power station with coupled district heating. A method of dioxin-free waste incineration does not exist with the present technical standards and cannot be found on the international markets. As for the problems related to dioxin the sciences are still in the beginnings. Presently, no limits of unhazardous emissions can be stated in a scientifically profound way without any doubts. Waste incineration plants are diametrically opposite the goals of raw material regaining. Their profitable operation depends on a quantity of waste products as constant as possible which is completely contrary to the absolute priority of waste management: avoiding waste products.

16490 **(KIYI—85-17) Device for digital data transmission by a coaxial cable.** Kisurin, V.A.; Berezin, F.N. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 14p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700829.

A set is described of CAMAC modules transmitter and receiver of identical structure for serial coded data exchange in multicomputer systems. Data transmission velocity is up to 125 Kword/s. The length of coaxial cable line is up to 0,5 km. 4 figs.

16491 **(LA-UR—86-4285) GaAs photoconductors to characterize picosecond response in GaAs integrated devices and circuits.** Hammond, R.B.; Paulter, N.G.; Gibbs, A.J. (Los Alamos National Lab., NM (USA)). 1986. Contract W-7405-ENG-36. 4p. (CONF-8608147—2). NTIS, PC A02/MF A01. File Number DE87003744.

From International conference on high-speed electronics; Stockholm, Sweden (7 Aug 1986).

Optoelectronic techniques that use femtosecond lasers and promise the precise measurement of transient response in high speed electronic devices and circuits have been under study for several years. We have investigated on-wafer electrical-impulse generation and sampling using femto-second-laser-excited GaAs photoconductors. This approach is applicable to any transmission line structure, it is directly integrable, non-invasive, jitter-free, and it is applicable to both microwave and digital circuits. We have developed the capability to: (a) generate electrical impulses in on-

wafer GaAs transmission lines with 3-dB bandwidths in excess of 60 GHz, and (b) sample the electrical impulse response of an on-wafer test structure without jitter and with a 3-dB measurement bandwidth of 103 GHz at a noise level of -67 dBm. We have studied dispersion in GaAs on-wafer coplanar-waveguide transmission lines.

16492 **(LA-UR—86-4286) Characterization of on-chip polycrystalline silicon photoconductors.** Fitzpatrick, D.K.; Bowman, D.R.; Hammond, R.B. (Los Alamos National Lab., NM (USA); Harris Semiconductor, Melbourne, FL (USA); Military Academy, West Point, NY (USA)). 1986. Contract W-7405-ENG-36. 5p. (CONF-8608147—). NTIS, PC A02/MF A01. File Number DE87003745.

From International conference on high-speed electronics; Stockholm, Sweden (7 Aug 1986).

We report experimental and modeling studies of on-ship photoconductor pulse generation and sampling. Specifically, we discuss (a) the effect of ion-beam damage on carrier lifetime and sampling-aperture time, (b) the circuit limits to pulse risetime, and (c) the room-temperature stability of ion-beam-damaged sampling gates.

16493 **(UCRL—94402) Integrated optical devices for high speed diagnostics.** McWright, G.M. (Lawrence Livermore National Lab., CA (USA)). Apr 1986. Contract W-7405-ENG-48. 26p. (CONF-8604292—1). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87003160.

From Society of Photo-Optical Instrumentation advanced institute on broadband photonic sensors; Howey-in-the-Hills, FL, USA (7 Apr 1986).

The design, fabrication, and evaluation of high speed directional coupler waveguide modulators for application to diagnostic systems is discussed.

16494 **Log amplifier with pole-zero compensation.** Brookshier, W. (to Dept. of Energy, Washington, DC). US Patent 4,634,986. 6 Jan 1987. Filed date 8 Feb 1985. vp.

This patent describes a log amplifier responsive to an input signal current for developing an amplified output signal and characterized by poles and zeros which vary with the input signal amplitude, the log amplifier circuit comprising: a first operational amplifier having an input terminal to which the input signal current is provided and an output terminal at which a first voltage is developed; a first feedback network coupled between the input terminal of the first operational amplifier and an intermediate point and including a nonlinear log element across which a second voltage which varies with the input signal current is developed; and a second feedback network including a second inverting operational amplifier coupled between the output terminal of the first operational amplifier and the intermediate point. It is responsive to the first voltage for developing a compensation signal and applying the compensation signal to the first feedback network in generating a compensated feedback signal at the input terminal of the first operational amplifier.

16495 **Optical analog data link with simple self-test feature.** Witkover, R.L. (to Dept. of Energy, Washington, DC). US Patent 4,633,523. 30 Dec 1986. Filed date 1 Feb 1984. vp.

A communications circuit is described for optically transmitting analog data free of excessive ripple comprising a V/F converter having an input line for receiving an analog voltage signal from a source of voltage. The V/F converter has an output and is effective to produce a predetermined minimum carrier frequency at the output responsive to receipt of a zero voltage signal on the input line. An optical transmitter is connected to receive voltage pulses from the output and is operable to produce flashes of light at frequencies varying in proportion to variations in the frequency of the voltage pulses. An optical transmission link is connected to transmit the flashes of light and an optical receiver is connected to receive flashes of light from the transmission link and is operable to produce a chain of voltage pulses the frequency of which varies in proportion to variations in the frequency of the received flashes of light.

16496 **Computational modeling of plasma-flow switched foil implosions.** Lindemuth, I.R. (Los Alamos National Lab., Los Alamos, NM). pp 1R-4 of IEEE conference record-abstracts of the 1985 IEEE international conference on plasma science. Piscataway, NJ; IEEE Service Center (1985). (CONF-850699—).

From Conference on plasma sciences; Pittsburgh, PA, USA (3 Jun 1985).

Turchi has proposed a "plasma-flow" or "commutator" switch as a means of achieving high dI/dt in a radially imploding metallic foil plasma. In this concept, an axially moving foil provides the initial coaxial gun discharge path for the prime power source and provides an "integral" inductive storage of magnetic energy. As the axially moving foil reaches the end of the coaxial gun, a radially imploding load foil is switched into the circuit. The authors have begun two-dimensional computer modeling of the two-foil implosion system. The authors use a magnetohydrodynamic (MHD) model which includes tabulated state and transport properties of the metallic foil material. Moving numerical grids are used to achieve adequate resolution of the moving foils. A variety of radiation models are used to compute the radiation generated when the imploding load foil converges on axis. The authors' computations attempt to examine the interaction of the switching foil with the load foil. In particular, the authors examine the relationship between foil placement and implosion quality. The status of the authors' computational effort is reported.

16497 **Observation of high-power microwave emission from a virtual cathode device.** Davis, H.A.; Bartsch, R.R.; Sherwood, E.G.; Stringfield, R.M. (Los Alamos National Lab., Los Alamos, NM). pp 1B-1 of IEEE conference record-abstracts of the 1985 IEEE international conference on plasma science. Piscataway, NJ; IEEE Service Center (1985). (CONF-850699—).

From Conference on plasma sciences; Pittsburgh, PA, USA (3 Jun 1985).

The authors report on experiments to generate high-power microwave radiation using a virtual cathode device. In these experiments an electron beam (I=90kA, V=1-3MV, t=60ns) produced in an unmagnetized diode is injected, through a thin window, into circular waveguide such that a virtual cathode is expected to form. The one centimeter diameter cathode is centered in a 3.6 centimeter diameter rounded housing. The microwave radiation produced is transported along circular waveguide which flares to 60cm diameter for extraction into air. Fast response-time microwave detectors are used to measure the microwave output as function of time. Dispersive waveguide channels are used to carry out spectral analysis in the standard waveguide channels from 8 to 40Ghz. In the frequency band from 2 to 8Ghz spectral measurements are made with bandpass filters. Frequency coverage in the fast response-time channels is from 8 to 40 Ghz. Power measurements are made by integrating radiation profiles measured by scanning from shot-to-shot. Arrays of fluorescent tubes are used to make single shot time-integrated mode measurements. The following experimental configurations have been investigated: 1. Waveguide diameters of 6,12 and 20cm; 2:Anode-cathode gap spacings varying from 0.4 to 0.9cm; 3. Vacuum and gas filled waveguide; 4. A variety of anode foil types and cathode shapes.

From Experts discussion on a waste management concept for the south western and southern Palatinate; Pirmasens, F.R. Germany (10 Dec 1984).

Abfallwirtschaft in Rheinland-Pfalz. No. 3.

In Germany, pyrolysis of municipal wastes is being tested in 2 pilot plants. As presently no data obtained under waste management conditions are available for both plants, an assessment is not possible. A refuse pit with untreated waste products still continues damaging the ecological system over decades after its closing which is due to seeping water and degasing. Furthermore, it heeps away from the ecological system utilizable substances (material recycling, energy recycling) which are completely buried forever. For rest material string, however, a pit is needed as no treatment and utilization method functions without residues. The residues should be in mineralized form (thermal treatment), however, in order to save the pit from uncontrolled decomposition processes and to be able to work in a volume-saving way.

16499 **(N—87-11858) User's manual for a TEACH computer program for the analysis of turbulent, swirling reacting flow in a research combustor.** Chiappetta, L.M. (United Technologies Research Center, East Hartford, CT (USA)). Sep 1983. 120p. (NASA-CR—179547; NAS—1.26:179547; R—83-915540-27). NTIS, PC A06/MF A01.

Described is a computer program for the analysis of the subsonic, swirling, reacting turbulent flow in an axisymmetric, bluff-body research combustor. The program features an improved finite-difference procedure designed to reduce the effects of numerical diffusion and a new algorithm for predicting the pressure distribution within the combustor. A research version of the computer program described in the report was supplied to United Technologies Research Center by Professor A. D. Gosman and his students, R. Benodeker and R. I. Issa, of Imperial College, London. The Imperial College staff also supplied much of the program documentation. Presented are a description of the mathematical model for flow within an axisymmetric bluff-body combustor, the development of the finite-difference procedure used to represent the system of equations, an outline of the algorithm for determining the static pressure distribution within the combustor, a description of the computer program including its input format, and the results for representative test cases.

16500 **(NP—7770048) Energy optimisation of industrial furnaces by optimum control.** Kohlgrueber, K. (Technische Hochschule Aachen (Germany, F.R.). Fakultaet fuer Bergbau und Huettenwesen). 19 Dec 1984. 161p. (In German). NTIS (US Sales Only), PC A08/MF A01. File Number DE87770048.

Process control of industrial furnaces is done on mathematical models from the energy point of view. This computer-aided optimisation process is first done on the mathematical model of an indirectly electrically heated experimental furnace (with individually controllable zones) in order to include a simple model furnace for solving this optimisation problem. An optimisation problem of the variation calculation is produced. Efficiencies are given, using the optimum control for minimum and maximum energy demand. In order to minimize the fuel and energy demand of continuous heating furnaces heated with fuel and operated in counterflow, a high temperature level should be aimed at the end of heating the contents, as in electric furnaces. It is proposed, based on the results of the investigation to use the ratio of the mass of material to the required mass of fuel, as well as the efficiency, for the assessment of furnaces heated with fuel. Optimum solutions are given for the stated heating times. (HWJ).

16501 **(N—87-11750, pp vp) Structural optimization of large ocean-going structures.** Hughes, O.F. 1984. NTIS, PC A22/MF A01. (NASA-CP—2327-PT-2; L—15830; NAS—1.55:2327-PT-2; CONF-8404323—Pt.2).

From Symposium on recent experiences in multidisciplinary analysis and optimization; Hampton, VA, USA (24 Apr 1984).

Ocean-going vehicles and platforms are among the largest structures in the world and are subjected to relatively harsh conditions of motions and loads. Some of them, such as semi-submersible platforms, are a relatively new type of structure and hence there is no formal, well evolved and established structural design code as there is for more traditional structures. More recently, efforts have also been made to develop a design method of this type for ships and other ocean structures. One of the many advantages of a rationally based design method is versatility; it can be used for structures that have widely differing purposes, measures of merit, shapes and sizes. The purpose is to describe a rationally based design method that has been developed within the field of ocean structures, in order that persons dealing with other types of structure can judge whether and to what extent its various features may be useful for those other types. Also, even though some features may not be applicable they might stimulate some useful ideas.

16502 **(ANL-HEP-CP—86-105) The ANL experiment for a wake field accelerator using an rf structure.** Ruggiero, A.G.; Schoessow, P.; Simpson, J. (Argonne National Lab., IL (USA)). 27 Aug 1986. Contract W-31-109-ENG-38. 20p. (CONF-8608123—10). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004945.

From Advanced accelerator concepts conference; Madison, WI, USA (21 Aug 1986).

Experiments are planned at ANL to study a new accelerating concept that has been developed during the last few years named the WAKEATRON. This requires a very special, simple configuration of the beams and of the rf structure involved. The basic concepts are explained. Like most proposed experimental work, this too was initiated by a considerable amount of computational work, both analytical and numerical, on which we would like to report. We will then describe details of the planned experiments we will carry out at ANL to check some of our predictions for this concept. These experiments concentrate on beam and cavity geometry applicable to the Wakeatron.

16503 **(ANL-HEP-CP—86-122) Extending the reach of the SSC [Superconducting Super Collider].** Diebold, R. (Argonne National Lab., IL (USA)). 1986. Contract W-31-109-ENG-38. 5p. (CONF-8606215—30). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004972.

From Summer study on the physics of the superconducting super collider ↑; 0.

The physics reach of the SSC can eventually be extended considerably by an increase in luminosity. New heavy particles and other phenomena with robust signatures would be readily identified even in the presence of large numbers of simultaneous background interactions. As an example, this note examines the case in which the number of protons per SSC bunch is increased by a factor of $\sqrt{10}$, while other parameters are held fixed at their CDR values, to give a luminosity of $10^{34}cm^{-2}sec^{-1}$. Impacts of the increased beam current on beam stability and the various subsystems are discussed. No fundamental problems have been found. While equivalent in some ways to a doubling of the energy, the costs of such a luminosity upgrade are small compared to the initial cost of the SSC. These costs are still substantial in absolute terms, however, especially in the area of cryogenic refrigeration. It is recommended that flexibility be built into the SSC to facilitate upgrades in a cost efficient manner.

16504 (BNL—51959, pp 1-14) **Construction and commissioning of the national synchrotron light source.** Galayda, J.N.; Blume, M. Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The road from conception to completion of a large facility like the National Synchrotron Light Source (NSLS) is a long and tortuous one. More than fifteen years have passed since the first discussions of a synchrotron radiation source at BNL, and there have been many twists and turns in the process. In putting together an accelerator project like this, there are many critical skills that must be assembled, and budgets, schedules and organizations must be properly examined. The lessons learned in design and commissioning of the NSLS rings may be summarized as follows: (1) the damped emittances expected of a Chasman-Green lattice are attainable at high current, if ion trapping problems can be circumvented; (2) there have been no unexpected effects from the rather strong sextupoles required to correct the chromaticities in this type of lattice; (3) the most important beam instabilities are coupled-bunch, and can be counteracted; and (4) commissioning the NSLS rings was mostly an effort to bring the hardware into conformation with the original ring design; achievement of the specified magnetic fields, injection timing, vacuum, RF voltages, etc. led to ring performance which was easily good enough to begin operation.

16505 (BNL—51959, pp 15-28) **Photon factory.** Tanaka, J.; Huke, K.; Chikawa, J. (National Lab. for High Energy Physics, Ibaraki, Japan). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The Photon Factory (PF) was established on April 1, 1978 at KEK. The PF is a synchrotron radiation facility, which has a 2.5 GeV electron storage ring fully dedicated to the SR usage and a 2.5 GeV electron linac supplying electrons and positrons to the PF ring and the accumulation ring of TRISTAN (30 GeV electron-positron colliding machine). The PF consists of three departments, injector linac, light source, and instrumentation department. The facility is described.

16506 (BNL—51959, pp 175-187) **ISSP-KEK new light source project.** Takehiko, I.; Goro, I. (Univ. of Tokyo, Japan). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The construction of a 1.0 GeV storage ring with 10 to 13 straight sections for insertion devices is planned as a joint project of the Institute for Solid State Physics, the University of Tokyo and the National Laboratory for High Energy Physics. The outline of the project and some aspects of the light source are described.

16507 (CEA-CONF—8529) **Feedback system analysis for beam breakup in a multipass multisection electron linac.** Mosnier, A.; Aune, B. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). Jun 1986. 4p. (CONF-860629—61; CEA-DPH-N-S—2351-3). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750466.

From Linear accelerator conference; Stanford, CA, USA (2 Jun 1986).

A recirculating electron accelerator based upon superconducting cavities technology is envisaged in different laboratories to produce a high duty cycle beam with energy in the GeV region. Beam break up is a severe limitation in this kind of accelerator due to the positive feedback of the returning beams. We present here an analysis based upon feedback system theory which takes into account the different cavities of the linac, the optics of the linac and of the recirculating path. An example is given for the Saclay proposal of a 2 GeV accelerator consisting of 4 passes in a 500 MeV, 100 m-long superconducting linac.

16508 (CONF-8611103—6) **ATLAS accelerator laboratory report.** Den Hartog, P. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004695.

From 20. symposium of North Eastern Accelerator Personnel ↑; 0.

The operation of the ATLAS Accelerator is reported. Modifications are reported, including the installation of conductive tires for the Pelletron chain pulleys, installation of a new high frequency sweeper system at the entrance to the linac, and improvements to the rf drive ports of eight resonators to correct failures in the thermally conductive ceramic insulators. Progress is reported on the positive-ion injector upgrade for ATLAS. Also reported are building modifications and possible new uses for the tandem injector. (LEW)

(Slovenska Akademia Vied, Bratislava, Czechoslovakia. Fyzikalny Ustav). Jun 1985. NTIS (US Sales Only), PC A03/MF A01. File Number DE87700739. (CONF-850635—Absts.).

From 4. international symposium on neutron induced reactions; Smolenice, Czechoslovakia (17 Jun 1985).

16510 (KIYI—85-21) **Problems and perspectives of the U-240 control system development.** Sakhno, V.I. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 16p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700831.

The main problems of construction of automated control system for the 240-cm isochronous cyclotron are stated. The structures are shown of the control system, constructed according to the module principle and guaranteeing the control and calculation functions of division. The main principles and procedure of cyclotron control are presented. 7 refs.; 4 figs.

16511 (KIYI—85-22) **Software of the module of automatic control system by power supply of the U-240 cyclotron.** Sokolova, N.A. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700832.

A specialized programme for microelectronic computer Electronics-60M is described for the module of control by power supply sources of cyclotron automatic control system. The possibility of module work is forseen in information and in control condition. The control programme and service subprogrammes have been have been written in macroassembler language. 1 ref.

16512 (KIYI—85-23) **Two-stage acceleration system of high intensity proton beam up to energy of 1 GeV using U-240 isochronous cyclotron.** Dem'yanov, A.V.; Linev, A.F.; Olejnik, E.E.; Sarkisyan, L.A.; Tulinov, A.F.; Chernyshenko, T.A. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 22p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700833.

The problems were discussed connected with the increase of proton energy from 80 MeV (240-cm cyclotron, Institute for Nuclear Research, the Ukrainian Academy of Sciences) to 850 MeV at ring cyclotron. H/sup -/ ion acceleration and its extraction based on a charge exchange in the first cyclotron and also the use of the beam extraction in high energy ring cyclotron based on the integral resonance on free radial oscillations alows to say about the medium beam currents equal to approximately 100-500 μA. Such acceleration complex may be considered as a prototype of a neutron generator where the technological process may be investigated and worked out, which are connected with electronuclear breeding. 11 refs.; 5 figs.

16513 (LA-UR—86-2243) **High-brightness rf linear accelerators.** Jameson, R.A. (Los Alamos National Lab., NM (USA)). 1986. Contract W-7405-ENG-36. 33p. (CONF-860756—7). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005133.

From NATO advanced course on high brightness accelerators; Pitlochry, Scotland (13 Jul 1986).

The issue of high brightness and its ramifications in linacs driven by radio-frequency fields is discussed. A history of the RF

linacs is reviewed briefly. Some current applications are then examined that are driving progress in RF linacs. The physics affecting the brightness of RF linacs is then discussed, followed by the economic feasibility of higher brightness machines. (LEW)

16514 **(NIIEFA-P-D—0637) Reliability of high-voltage electron accelerators.** Al'bertinskij, B.I.; Svin'in, M.P.; Tsepakin, S.G. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1984. 26p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700842.

Reliability of high-voltage electron accelerators may be evaluated taking account of the general reliability theory. It's main reliability factors are failure interval and utilization rate. At the stage of accelerator designing normalization of these factors, comparative evaluation of accelerator layout variants and use of different elements, reliability calculations for redundant systems are carried out; duration of life testings are determined too. Statistical data obtained during accelerator operation allowed to estimate reliability of operating accelerators, to augment reliability of designed separate units and accelerators on the whole, as well as to determine ways of their further reliability augmentation. 17 refs.

16515 **(NIIEFA-P-V—0684) Experimental study of two-beam resonator accelerator in a pulse mode.** Bel'skij, N.P.; Vorogushin, M.F.; Zvyagin, V.V.; Korobov, V.I.; Mudrolyubov, V.G.; Skrydlyak, I.S. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 13p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700847.

The results of experimental study of a pulse resonator accelerator with modulated beam excitation are presented. The main accelerator unit is a transforming resonator of complex form excited at the second azimuthal-symmetric type of oscillations, at that the accelerated and exciting beams crossing the gap respectively in the first and second antinodes of HF electric field. The two-beam scheme efficiency is determined by the resonator geometry and by the conditions of shaping and deceleration of auxiliary beam. In case of resonator unit excitation from external generator of 1.5 kW the following parameters are obtained: transformation coefficient approximately 80; excitation efficiency approximately 80%; excitation power 35 kW in the pulse of 300 μs duration at the repetition rate up to 6 Hz. Maximum energy of electron accelerated beam is 400 keV at pulse current of 20 mA. 2 refs.; 12 figs.

16516 **(SLAC-PUB—4179) Unique radiation problems associated with the SLAC Linear Collider.** Jenkins, T.M.; Nelson, W.R. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Jan 1987. Contract AC03-76SF00515. 22p. (CONF-870219—9). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004898.

From Midyear topical symposium of the Health Physics Society: health physics of radiation-producing machines; Reno, NV, USA (8 Feb 1987).

The SLAC Linear Collider (SLC) is a variation of a new class of linear colliders whereby two linear accelerators are aimed at each other to collide intense bunches of electrons and positrons together. Conventional storage rings are becoming ever more costly as the energy of the stored beams increases such that the cost of two linear colliders per GeV is less than that of electron-positron storage rings at cm energies above about 100 GeV. The SLC being built at SLAC is designed to achieve a center-of-mass energy of 100 GeV by accelerating intense bunches of particles, both electrons and positrons, in the SLAC linac and transporting them along two different arcs to a point where they are focused to a small radius and made to collide head on. The SLC has two main goals. The first is to develop the physics and technology of linear colliders. The other is to achieve center-of-mass energies above 90 GeV in order to investigate the unification of the weak and electromagnetic interactions in the energy range above 90 GeV; (i.e., Z^0, etc.). This note discusses a few of the special problems that were encountered by the Radiation Physics group at SLAC during the design and construction of the SLAC Linear Collider. The nature of these problems is discussed along with the methods employed to solve them.

16517 **Study of neutron leakage through an Fe shield at an accelerator.** Elwyn, A.J.; Cossairt, J.D. (Fermi National Accelerator Lab., Batavia, IL). *Health Physics;* No. 6, 723-735(Dec 1986).

The spectrum of neutrons, produced in the interactions of hadrons with energies up to several hundred GeV, that are emitted through a large Fe electro magnet has been determined by use of a multisphere spectrometer both before and after the shielding was augmented with concrete. The existence of leakage neutrons at energies of approximately 0.005-1.0 MeV was verified in the initial configuration, and found to be completely eliminated in the spectrum obtained after the concrete was added. The quality factor of the radiation field was measured; the values are reduced from about six to three with the extra shielding. Additional fluence measurements in the environs of the magnet can be interpreted in terms of a skyshine mechanism with source and attenuation parameters consistent with the energies and intensity of the leakage neutrons.

16518 **Neutron shields for medium-energy accelerators.** Morford, R.J.; Carter, L.L. (Westinghouse Hanford, Richland, WA). *Transactions of the American Nuclear Society;* 53: 410-412(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The purpose of this work was to support the design of neutron shields for medium-energy accelerators using neutron transport codes and high-energy cross-section sets. In addition, an estimate was made of the effect of conservatism on facility cost, and thus the incentive to reduce uncertainty associated with the analyses.

16519 **The tevatron energy doubler: A superconducting accelerator.** Edwards, H.T. (Fermi National Accelerator Lab., Batavia, IL). pp 605-660 of Annual review of nuclear and particle science. Volume 35. Jackson, J.D.; Gove, H.E.; Schwitters, R.F. Palo Alto, CA; Annual Reviews Inc. (1985).

The Energy Doubler was commissioned between June and September of 1983. Beam was first accelerated in July to 512 GeV. Fixed-target operation at 400 GeV began in October 1983 and the energy was increased to 800 GeV in February 1984. At this writing there have been three physics runs over a total of about 12 months duration, so one can begin to make some generalizations about the operational behavior of the accelerator. The three runs were at 400, 800, and 800 GeV with fast extraction. Intensity to date has not exceeded 1.1 x 10/sup 13/ ppp. Single-beam storage studies have been carried out. The rapid commissioning was successful probably because of the many step-by-step tests of components and subsystems that were made over the years prior to the final beam test. Though the major systems were not particularly reliable, they were all checked out and working. Interruptions to beam studies were at the level of trips of the ramp caused by refrigerator instabilities or spurious quenches caused by the quench protection system rather than any basic flaws.

16520 **(BARC—1256) RF-phase measurement and optimization for the Variable Energy Cyclotron, Calcutta.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 49p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701251.

For improving the beam quality in a cyclotron it is necessary that the radio frequency phase of the internal beam be optimized. For this purpose the phases have been measured by two techniques, viz., the Smith-Garren procedure and the prompt gamma method at various radii. A prompt gamma setup has been developed and installed at the Variable Energy Cyclotron, Calcutta. The measured phases have been used to find out the changes in the currents of various trim coils. A procedure for minimizing the phases has been given and the first results have been discussed. 7 refs., 11 figures.

16521 **(CNIC—00009) Application of graphical design method to beam transport system.** (China Nuclear Information Centre, Beijing, BJ). Apr 1986. 14p. (In Chinese). (IAE—0009). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701279.

A graphical design method in which a partical beam with initial divergence can realize waist to waist transport in both X and Y planed simultaneously by means of quadrupole doublet is presented. Graphical mathod and transport matrix as well as charts can be used so that a quick design can be carried out to save computer time considerably. A concrete example of the beam is given to demonstrate the practical application of the theory mentioned above.

16522 **(DOE/ER/40124—12) Beam dynamics calculations for the linac booster beam line.** Lu, J.Q.; Cramer, J.G.; Storm, D.W. (Washington Univ., Seattle (USA). Nuclear Physics Lab.). [1987]. Contract AC06-84ER40124. 21p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005551.

Beam optics focusing characteristics both in the transverse and longitudinal directions of the superconducting linac booster beam line are calculated for different particles. Three computer programs, which are TRANSPORT, LYRA and ENTIME, are used to simulate particle motions. The first one is used to simulate the particle radial motions. The effects of energy increase on to the transverse phase space area are considered by putting in accelerating matrices of each resonators. The second program is used to simulate particle longitudinal motions. Beam longitudinal motions are calculated with program ENTIME also, with which visual pictures in the Energy-Time phase space can be displayed on the terminal screen. Besides, the stability of the particle periodic motions in the radial directions are considered and calculated.

16523 **(EFI—777(4)-85) Phase velocity of wave in irregular waveguide in problems of synthesis.** Azizbekyan, G.V. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 12p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700673.

The problems related to the choice of phase velocity of waves in irregular waveguides when solving the problems of synthesis that allow to determine the waveguide geometric parameters by the given output parameters of a charged particle beam in waveguide electron and proton accelerators or the output power of the electromagnetic radiation field in travelling wave generators and amplifiers are considered. Phase coefficients of the waves of the effective electromagnetic field, which is the sum of the field excited by the beam and the generator field, are determined. The expressions obtained for the phase velocity of waves in a waveguide allow estimates for limiting values of radiation currents and rates. 6 refs.

16524 **(IFVE-OI—85-185) Systematic errors in field measurements in a hf quadrupole focusing accelerator.** Barsukov, A.B.; Belyaev, O.K.; Igoshin, V.B. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 13p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700716.

The paper presents the results on verification of the constant error correction formulas for the perturbation method of electromagnetic field measurement in the accelerating structure with RF quadrupole focusing. Plots of frequency perturbation distribution, both experimental and estimated ones are given. The method of error correction is described and the estimation of an accidental error is given. 10 refs.; 8 figs.; 1 tab.

16525 (INIS-SU—370, pp 26-29) **Manifestation of sleeping-instability in partially-compensated relativistic electron beams.** Karbushev, N.I.; Rukhadze, A.A.; Udivichenko, S.Yu. (AN SSSR, Moscow. Inst. Obshchej Fiziki). 1984. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE87780078.

In Experimental and theoretical physics. Collection.

Problem of sleeping-instability in partially-compensated relativistic electron beam is exactly solved for the ring waveguide. Nonuniformity of beam velocity is conditioned by electrostatic potential sagging.

16526 **(JINR—9-85-769) On tolerances for random perturbations of accelerating electric field in the KUTI-20 induction accelerating system (LUEhK-20).** Kazarinov, N.Yu.; Kazacha, V.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of New Acceleration Methods). 1985. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700766.

For the KUTI-20 induction accelerating system (LUEhK-20) the correlation functions of random processes connected with fluctuations of the main parameters of the accelerating electric field Esub(z) forming system are determined. These are the peak value of accelerating voltage on gaps, the shift of the inductor as a unite, the shift of gaps inside the inductors and the axial dimensions of the gaps. Permissible values of their spread required for the self-focusing electron-ion ring stable acceleration in electric and guiding magnetic fields are determined. It is shown that the spread of the magnetic system parameters exerts a decisive influence on the formation of dipole oscillations in the accelerating electron-ion ring. It is also shown that the tolerances on the spread of Esub(z) forming system parameters proved to be by two orders less rigid than tolerances on the magnetic system parameters and can be easily realized. 3 refs.; 3 figs.

16527 **(JINR-R—11-85-766) Quadrupole lense field potential determination by the boundary integral equation method.** Akopyan, V.P.; Sarkisyan, G.Kh.; Smirnova, L.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1985. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700813.

Numerical method for investigating the effect of small disturbances in quadrupole magnetic lense piece configuration on the field potential is proposed. The problem of field potential determination is reduced to a boundary integral equation. The method of the obtained equation discretization is considered. The dimensions of the piece stepwise surface are determined by the nongradient method of slipping tolerance. The results of numerical calculations are presented. 7 refs.; 2 tabs.; 2 figs.

16528 **(LA-UR—86-3643) Factors limiting the operation of structures under high gradient.** Schriber, S.O. (Los Alamos National Lab., NM (USA)). 1986. Contract W-7405-ENG-36. 7p. (CONF-860629—68). NTIS, PC A02. File Number DE87005132.

From Linear accelerator conference; Stanford, CA, USA (2 Jun 1986).

Factors limiting the operation of rf structures under high-gradient conditions are described. Included are recent rf measurements at laboratories in Europe, Asia, and North America and how these measurements relate to earlier data as exemplified by the use of the Kilpatrick criterion (Kp). Operation limitations will cover mechanical, geometry, thermal, and surface constraints and the associated impact on structure design, fabrication, and material selection. Generally, structures operating continuous wave (100% duty factor) appear to be limited to peak surface fields at about twice the Kilpatrick limit, whereas pulsed structures operating with pulse lengths less than a millisecond can attain peak surface fields five times the Kilpatrick limit.

16529 **(LAL-RT—85-16) High field electron linacs.** Le Duff, J. (Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire). Dec 1985. 22p. (CONF-8509330—4). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750450.

From CERN accelerator school; Oxford, UK (16 Sep 1985).

High field electron linacs are considered as potential candidates to provide very high energies beyond LEP. Since almost twenty years not much improvement has been made on linac technologies as they have been mostly kept at low and medium energies to be used as injectors for storage rings. Today, both their efficiency and their performances are being reconsidered, and for instance the pulse compression sheme developed at SLAC and introduced

to upgrade the energy of that linac is a first step towards a new generation of linear accelerators. However this is not enough in terms of power consumption and more development is needed to improve both the efficiency of accelerating structures and the performances of RF power sources.

16530 **(NIIEFA-P-E—0665) TOREX program for calculating aberration coefficients of magnetooptical systems.** Nagaenko, M.G. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1984. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700843.

Description of the TOREX program for computer-aided design of aberration coefficients of the 2nd and 3rd order of magnetooptical cyclic accelerator systems, transport channels and charged particle beam shapers is given. Calculation of aberration coefficients is based on the method of trajectory tracing using differential approximations of high accuracy differential operators. The program is executed on the FORTRAN-4 applically to the ES-computer. 3 refs.

16531 **Gas-phase photoemission with soft x-rays: Cross sections and angular distributions.** Shirley, D.A.; Kobrin, P.H.; Truesdale, C.M.; Lindle, D.W.; Ferrett, T.A.; Heimann, P.A.; Becker, U.; Kerkhoff, H.G.; Southworth, S.H. (Materials and Molecular Research Div., Lawrence Berkeley Lab., and Dept. of Chemistry, Univ. of California, Berkeley, CA 94720). pp 150-156 of Science with soft x-rays. Himpsel, F.J.; Klaffky, R.W. Bellingham, WA; SPIE Society of Photo-Optical Instrumentation Engineers (1983). (CONF-8310172—). Contract AC03-76SF00098.

From Advances in soft x-ray science and technology conference; Upton, NY, USA (17 Oct 1983).

A summary is presented of typical gas-phase photoemission studies based on synchrotron radiation in the 50-5000 eV range, using beam lines at the Stanford Synchrotron Radiation Laboratory. Three topics are addressed: atomic inner-shell photoelectron cross sections and asymmetries, correlation peaks in rare gases, and core-level shape resonances in molecules. Photoelectron cross-section σ(n iota) and asymmetry-parameter β(n iota) studies in mercury vapor at photon energies up to 270 eV (up to 600 eV for β/sub 4f/) extend coverage of these parameters to n≦5 and iota≦3. Comparison with Dirac-Slater and relativistic random-phase approximation calculations reveals systematic discrepancies. For example, distinct Cooper minima in σ(n iota) are observed but not predicted, while predicted β(n iota) values are typically too high. Correlation satellites have been studied for the K shells of helium ($h\nu$ = 68-90 eV), neon ($h\nu$ = 870-960 eV) and argon ($h\nu$ = 3200-3320 eV). In helium the n=2 satellite peak was shown to have mainly 2p character at threshold, and its asymmetry was measured through the autoionizing resonance region. Tentative evidence was obtained that the neon satellites are less intense near threshold than in the high-energy limit, and that their intensities stay constant or decrease with increasing energy near threshold. A new satellite was observed in argon at 24.6 eV which appears to increase in intensity with energy. Molecular core-level shape resonances were observed for the first time by photoemission, yielding $\sigma(h\nu)$ and $\beta(h\nu)$ for core levels from 180 eV binding energy (S 2p in SF/sub 6/ and OCS) through C 1s in CO, CO/sub 2/ and CF/sub 4/, N 1s in N/sub 2/ and NO, and O 1s in CO and CO/sub 2/ to 2490 eV (S 1s in SF/sub 6/). Several conclusions can be drawn about the photoelectron and Auger cross sections and asymmetry parameters.

16532 **Optimum undulator trajectories.** Tatchyn, R. (Stanford Synchrotron Radiation Lab. and Stanford Electronics Labs., Stanford Univ., 421 McCullough, Stanford, CA 94305). pp 16-22 of Science with soft x-rays. Himpsel, F.J.; Klaffky, R.W. Bellingham, WA; SPIE Society of Photo-Optical Instrumentation Engineers (1983). (CONF-8310172—).

From Advances in soft x-ray science and technology conference; Upton, NY, USA (17 Oct 1983).

The undulator is a machine that induces amplitude fluctuations in normally-rectilinear electron trajectories, causing coherently-reinforced radiation to appear along the direction of electron motion. Presently, such machines operate on electrons travelling in straight sections of synchrotron rings. The inherently large number of variable characterizing the undulator-electron interaction makes it difficult to identify the principal parameters for optimization when designing synchrotron rings dedicated to undulator operation. The results are presented of a variational analysis of the equation describing undulator radiation. In particular, the results identify the optimum electron trajectories in undulators, in the sense of maximizing the intensity of the emitted radiation in the forward direction, and establish the optimum amplitudes of the electron motion. These important results are presented in terms of the total electron velocity, βc, and the average on-axis velocity β*c. The results, besides providing a valuable insight into undulator operation, rigorously establish the principal optimization parameters for associated synchrotron ring design.

16533 **(BNL—38938) Design considerations for a combined synchrotron-light source and heavy-ion storage ring Atomic Physics Facility.** Jones, K.W.; Johnson, B.M.; Meron, M.; Lee, Y.Y.; Thieberger, P.; Thomlinson, W.C. (Brookhaven National Lab., Upton, NY (USA)). 10 Nov 1986. Contract AC02-76CH00016. 34p. (CONF-861114—44). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005251.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

An Atomic Physics Facility (APF) based on the combination of photons produced by a synchrotron light source with heavy ions in a storage ring will open the way to the study of ionic states of almost all elements. The design considerations for such a facility are discussed in terms of the use of synchrotron radiation for photoexcitation and ionization experiments. Design considerations for an APF are given in terms of the accelerator facilities presently available at BNL which include the National Synchrotron Light Source and Tandem Van de Graaff Laboratory. The results show that the concept is valid and therefore that implementation would result in entirely new capabilities for the study of multiply-ionized atoms.

16534 **(BNL—39105) Trace element measurements using white synchrotron radiation.** Hanson, A.L.; Jones, K.W.; Gordon, B.M.; Pounds, J.G.; Kwiatek, W.M.; Long, G.J.; Rivers, M.L.; Sutton, S.R. (Brookhaven National Lab., Upton, NY (USA); Chicago Univ., IL (USA). Dept. of Geophysical Sciences). 10 Nov 1986. Contract AC02-76CH00016. 21p. (CONF-861114—46). NTIS, PC A02. File Number DE87005244.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

Synchrotron radiation, when used for x-ray fluorescence (XRF) has several advantages over conventional x-ray sources. Our group at Brookhaven National Laboratory is developing the equipment and expertise to make XRF measurements with synchrotron radiation. The apparatus is briefly described, along with the alignment techniques. Some minimum detectable limits for trace elements in thin biological standards measured with white light irradiations are presented.

16535 **(BNL—39109) Applications of synchrotron x-ray fluorescence to extraterrestrial materials.** Sutton, S.R.; Rivers, M.L.; Smith, J.V. (Brookhaven National Lab., Upton, NY (USA); Chicago Univ., IL (USA). Dept. of Geophysical Sciences). 1986. Contract AC02-76CH00016. 18p. (CONF-861114—45). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005243.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

Synchrotron x-ray fluorescence (SXRF) is a valuable technique for trace element analyses of extraterrestrial materials permitting minimum detection limits less than 1 ppM for 20 micrometer spots. SXRF measurements have been performed on iron meteorites and micrometeorites using white synchrotron radiation and an

energy dispersive x-ray detector at the National Synchrotron Light Source (X-26C), Brookhaven National Laboratory (NY). Partitioning of Cu between troilite (FeS) and metal in the nine iron meteorites studied suggests sub-solidus re-equilibration in these objects. A technique has been developed for determining self-absorption corrections for filtered, continuum excitation of small specimens, such as stratospheric particles and refractory inclusions in meteorites.

16536 **(CEA-CONF—8531) Interaction of GeV heavy ions with solids-first results at GANIL.** Dural, J.; Jousset, J.C.; Balanzat, E.; Toulemonde, M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Jun 1986. 10p. (CONF-8606101—7). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750460.

From 5. international conference on ion beam modification of materials; Catania, Italy (9 Jun 1986).

The Grand Accelerateur National d'Ions Lourds (GANIL) of CAEN, France accelerates ions from C to U in the energy range from 100 MeV/amu to 10 MeV/amu. The Centre Interdisciplinaire de Recherches avec les Ions Lourds (CIRIL) is in charge of the non nuclear facilities and assists, at GANIL, the physicists of both fields atomic physics and condensed matter physics. Irradiation facility and first typical results for condensed matter physics are presented.

16537 **(CNIC—00005) Surface ionization ion source with high current.** (China Nuclear Information Centre, Beijing, BJ). Apr 1986. 10p. (In Chinese). (IAE—0005). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701275.

The working principle and structure of a surface ionization ion source with high current is described systematically. Some technological keypoints of the ion source are given in more detail, mainly including: choosing and shaping of the material of the surface ionizer, heating of the ionizer, distributing of working vapour on the ionizer surface, the flow control, the cooling problem at the non-ionization surface and the ion optics, etc. This ion source has been used since 1972 in the electromagnetic isotope separator with 180 deg angle. It is suitable for separating isotopes of alkali metals and rare earth metals. For instance, in the case of separating Rubidium, the maximum ion current of Rbsup(+) extracted from the ion source is about 120 mA, the maximum ion current accepted by the receiver is about 66 mA, the average ion current is more than 25 mA. The results show that our ion source have advantages of high ion current, good characteristics of focusing ion beam, working stability and structure reliability etc. It may be extended to other fields. Finally, some interesting phenomena in the experiment are discussed briefly. Some problems which should be investigated are further pointed out.

16538 **(CONF-860939—2) Thin film coatings which inhibit spin relaxation of polarized potassium atoms.** Thomas, G.E.; Holt, R.J.; Boyer, D.; Green, M.C.; Kowalczyk, R.S.; Young, L. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 12p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004715.

From 13. world conference of the Nuclear Target Development Society; Chalk River, Canada (17 Sep 1986).

A prototype of a polarized deuterium target which employs the spin exchange method is being developed. The mixing cell for mixing deuterium atoms and potassium vapor requires a surface that will reflect these atoms without being destroyed by the corrosive potassium. Thin film coating methods and a technique for coating pyrex are described. Results of spin relaxation measurements are given. (LEW)

16539 **(CONF-861114—39) Scientific opportunities at the proposed 6-7 GeV Advanced Photon Source.** Shency, G.K.; Viccaro, P.J. (Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 14p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004683.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

Two different types of insertion devices - undulators and wigglers - have been developed to satisfy the many present and future requirements of various investigations using synchrotron radiation. The characteristics of the radiation from the Advanced Photon Source at Argonne are summarized, including the insertion device sources, source size and brilliance, and spectral character of the wiggler and undulator sources. Possible applications of the source are also given. (LEW)

16540 **(CONF-861114—40) Development of a polarized deuterium target by spin exchange with optically pumped K.** Young, L.; Holt, R.J.; Green, M.C.; Kowalcyzk, R.S. (Argonne National Lab., IL (USA)). Nov 1986. Contract W-31109-ENG-38. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004686.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

The development of a polarized internal target at an electron store ring is of great interest for studies in nuclear physics. The deuterium nuclei acquire polarization via the hyperfine interaction after electron spin exchange with optically pumped potassium vapor. A high power laser which covers the entire doppler width and hyperfine splitting of the ^{2}S/sub 1/2/ - ^{2}P/sub 1/2/ transition in potassium has been developed. Spin relaxation rates for potassium on various wall coatings have been measured. A dri-film surface has been shown to preserve polarization (>100 bounces), be long-lived at elevated temperatures, and to be efficient at preventing deuterium recombination.

16541 **(CONF-861114—53) The ATLAS Positive-Ion Injector project.** Pardo, R.C.; Bollinger, L.M.; Shepard, K.W. (Argonne National Lab., IL (USA)). 10 Nov 1986. Contract W-31109-ENG-38. 19p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004754.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

The goal of the Argonne Positive Ion Injector project is to replace the ATLAS tandem injector with a facility which will increase the beam currents presently available by a factor of 100 and to make available at ATLAS essentially all beams including uranium. The beam quality expected from the facility will be at least as good as that of the tandem based ATLAS. The project combines two relatively new technologies - the electron cyclotron resonance ion source, which provides high charge state ions at microampere currents, and RF superconductivity which has been shown to be capable of generating accelerating fields as high as 10 MV/m, resulting in an essentially new method of acceleration for low-energy heavy ions.

16542 **(CONF-8609234—1) Progress on the IPNS Enriched Uranium Booster Target.** Knox, A.E.; Carpenter, J.M.; Bailey, J.L.; Armani, R.J.; Blomquist, R.N.; Brown, B.S.; Henley, D.R.; Hins, A.G.; Loomis, B.A.; Schulke, A.W. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 35p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004846.

From International collaboration on advanced neutron sources ↑; 0.

We describe the Enriched Uranium Booster Target designed for use in Argonne's Intense Pulsed Neutron Source. This report contains a general description of the system, and descriptions of the thermal-hydraulic and loss-of-coolant accident analyses, of the neutronic, criticality and power density calculations, of the assessment of radiation and thermal cycling growth, and of the disk fabrication methods. We also describe the calculations of radionuclide buildup and the related hazards analysis and our calculations of the temperature and stress profiles in the disks, and briefly allude to considerations of security and safeguards.

16543 **(DOE/ER/40124—10) A 300 kV isolation platform at the University of Washington.** Harper, G. (Washington Univ., Seattle (USA). Nuclear Physics Lab.). 1986. Contract AC06-84ER40124. 5p. (CONF-8611103—5). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003132.

From 20. symposium of North Eastern Accelerator Personnel ↑; 0.

An isolated platform for the voltage elevation of ion sources used by the Nuclear Physics Laboratory at the University of Washington has been built and its installation is nearing completion. This

report describes the purpose, major components, presents status, and future plans of the platform project.

16544 **(EFI—776(3)-85) Calculation and modelling of electron channel with a beam small angular divergence.** Danagulyan, S.S. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700672.

The algorithm for calculation and optimization of parameters of the Erevan synchrotron electron channel is described. The beam parameters are calculated by the Monte Carlo method. The effects of experimental factors on final particle distribution are discussed. Coordinate, angular and momentum distributions of particles in a beam are presented. Mean values of a beam angular divergence are 0.05 and 0.03 mrad in horizontal and vertical planes correspondingly. 7 refs.; 11 figs.

16545 **(EFI—779(6)-85) Erevan accelerator with a beam small angular divergence.** Avakyan, R.O.; Agaronyan, A.V.; Avetisyan, A.Eh. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 14p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700674.

A channel with a beam small angular divergence designed for experiments on the investigation of interactions of high energy electrons with single crystals is described. Characteristics of the channel main components are presented. Results of the beam profile measurements are compared to those of computer calculations. The electron beam divergence is estimated to be 5 x 10/sup -5/ rad. 7 refs.; 3 figs.

16546 **(EFI—784(11)-85) Data acquisition and storage system for the e-A experimental setup on the basis of the Ehlektronika-60 microcomputer.** Arutyunyan, V.N.; Badalyan, G.V.; Zograbyan, G.G.; Melikov, G.I.; Pasoyan, O.I.; Pogosov, V.S.; Shatyan, S.A.; Ehlbakyan, E.G. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700678.

A system for acquisition and storage of information from (Δ E, E) telescopes of silicon semiconductor detectors being a part of the "e-A" experimental setup used on the Erevan electron synchrotron internal beam which is designed for the spectrometry of heavy charged particles is described. The software performing the information storage, the calibration of spectrometric tracts, the periodical control of measurements as well as preliminary calculations allowing to obtain quickly some measurement results is described. The system is tested on the accelerator beam. 4 refs.; 2 figs.

16547 **(EFI—790(17)-85) Experimental method for investigating γd->pn photodisintegration reaction on the linearly polarized photon beam of the Erevan synchrotron.** Agababyan, K.Sh.; Adamyan, F.V.; Ajrapetyan, A.V. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 32p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700682.

The experimental method for measuring the asymmetry of the γd -> pn photodisintegration reaction on the linearly polarized photon beam of the Erevan synchrotron is described. The results of Monte Carlo calculations, the calibration of apparatus, the procedure of measurements and experimental data processing are repored. 26 refs.; 15 figs.; 2 tabs.

16548 **(EFI—793(20)-85) Characteristics of the Erevan synchrotron extracted electron e/sup -//sub 4/beam.** Bagdasaryan, D.S.; Boyakhchyan, E.M.; Kazaryan, G.B.; Karibyan, M.D.; Markaryan, Eh.R.; Mkrtchyan, G.G. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1984. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700684.

Characteristics of the electron beam used in experiments on particle electroproduction are reported. The scheme of beam formation, transport and parameters control as well as methods of measuring its characteristics are described. 6 refs.; 6 figs.

16549 **(FNAL/C—86/156) Shielding design at Fermilab: Calculations and measurements.** Cossairt, J.D. (Fermi National Accelerator Lab., Batavia, IL (USA)). Nov 1986. Contract AC02-76CH03000. 18p. (CONF-870219—6). NTIS, PC A02/MF A01. File Number DE87003854.

From Midyear topical symposium of the Health Physics Society: health physics of radiation-producing machines; Reno, NV, USA (8 Feb 1987).

The development of the Fermilab accelerator complex during the past two decades from its concept as the "200 BeV accelerator" to that of the present tevatron, designed to operate at energies as high as 1 TeV, has required a coincidental refinement and development in methods of shielding design. In this paper I describe these methods as used by the radiation protection staff of Fermilab. This description will review experimental measurements which substantiate these techniques in realistic situations. Along the way, observations will be stated which likely are applicable to other protron accelerators in the multi-hundred GeV energy region, including larger ones yet to be constructed.

16550 **(FNAL-TM—1436) Fermilab Central Computing Facility: Energy conservation report and mechanical systems design optimization and cost analysis study.** Krstulovich, S.F. (Fermi National Accelerator Lab., Batavia, IL (USA)). 12 Nov 1986. Contract AC02-76CH03000. 38p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005562.

This report is developed as part of the Fermilab Central Computing Facility Project Title II Design Documentation Update under the provisions of DOE Document 6430.1, Chapter XIII-21, Section 14, paragraph a. As such, it concentrates primarily on HVAC mechanical systems design optimization and cost analysis and should be considered as a supplement to the Title I Design Report date March 1986 wherein energy related issues are discussed pertaining to building envelope and orientation as well as electrical systems design.

16551 **(FNAL-TM—1437) Deflection analysis for an SSC [Superconducting Super Collider] dipole magnet with two external supports.** Nicol, T.H. (Fermi National Accelerator Lab., Batavia, IL (USA)). 9 Jan 1987. Contract AC02-76CH03000. 13p. NTIS, PC AA02/MF A01; 1; GPO Dep. File Number DE87005563.

SSC dipole magnets are presently supported at five mounting locations coincident with the internal cold mass supports. There is growing interest in reducing the number of external supports from five to two for reasons of simplified installation and alignment and as a cost reduction measure. This reports examines the placement of two external supports required to minimize the deflection of the cold mass assembly.

16552 **(IFVE-OI—85-134) HF-field stabilization in the booster injector debuncher.** Mal'tsev, I.G.; Nagaev, V.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700715.

The paper deals with problems of the HF-field stabilization in the booster injector debuncher. The debuncher is the two-gap coaxial resonator working at the 148.5 MHz frequency. Requirements to HF-field stability are determined. The HF-field perturbations by beam loading are estimated. Investigations have shown

that the HF-field perturbations depend strongly on electric length of feeder on direct connection of generator with debuncher. A method of choice of regime parameters is selected to stabilize the field in debuncher. The essence of the method is that at several regimes of the final amplifier tubes and parameters of its connection with resonator the generator adds power automatically, corrects the phase and field amplitude in resonator changing under the effect of the beam. Conclusion is made that for stabilization of the field amplitude in debuncher the phase lengths of feeder close to $\pi/2(1+p)$ where p=0,1,2,... is the most admissible one. 4 refs.; 5 figs.; 1 tab.

16553 **(IFVE-OKU—85-23) High-intensity proton beam formed onto internal target of the IHEP accelerator.** Ado, Yu.M.; Aseev, A.A.; Grishin, V.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 13p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700717.

A new mode of proton beam extraction with intensity up to 3 x 10/sup 10/ ppp has been investigated and realized at the IHEP accelerator. The beam is formed by the elastic scattering of the accelerated proton beam onto the internal target at the angle approximately 1 mrad. For extraction of the proton beam and focusing it on the external targets the septum magnets of the extraction slow system and elements of channel 8 are used. According to calculations this beam is polarized with the degree of up to 3%. 8 refs.; 14 figs.

16554 **(IFVE-OP—85-132) Setup for studying targets irradiated by high density proton beam.** Alferov, V.N.; Gusak, A.A.; Bayanov, B.F. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 21p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700720.

An experimental setup designed for investigation of the thermophysical processes in target-sources of secondary particles undergoing the radiation heating under the proton beam action is described. Proton energy is 70 GeV, intensity is up to 5.10/sup 13/ ppp. The use of short-focus lithium lens prmits to focus a beam into a spot of the diameter from 3 to 0.6 mm. The setup is equiped with precise techniques of beam parameter control and taget temperature state operating on-line with a computer. Results of mesuring equipment tests at the work with the beam and preliminary experimental data on energy release in a lead target are presented. 14 refs.; 13 figs.

16555 **(IFVE-OP—85-149) Relativistic positronium channel at the IHEP accelerator.** Gubrienko, K.I.; Zajtsev, M.M.; Zelenin, V.E. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 13p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700721.

Submitted to the journal Instrum. Exp. Tech. .

Positronium beams permit to investigate the interaction of ultrarelativistic atoms with a substance and observe the effect of superpermeability, measure the cross section of direct photons generation with low transverse momenta determine by model independent method the π/sup 0/-meson life time, realize testing the Lorentz transformations for momentum time and components of electromagnetic field at high values of gamma-factors. The high-vacuum channel intended for obtaining ultrarelativistic positronia at the Serpukhov accelerator is described. The total length of the channel is approximately 40 m. A weak transverse magnetic field in the section of 23 m length is created by purifying magnets with magnetic field of 56 Oe. For ensuring radiation safety a beam chopper is introduced into the channel. Positronium generation by protons with 70 GeV has been realized at internal rotating targets with of carbon films of 0.35 and 0.5 μm thickness. Described are the conditions of the experiment in the course of which relativistic positronia with gamma-factors from 800 to 2000 have been observed. Total quantity of positronia passed through. 14 refs.; 3 figs.; 1 tab.

16556 **(IFVE-ORI—85-148) Low-energy neutron spectra behind the IHEP accelerator shields.** Belogorlov, E.A.; Britvich, G.I.; Krupnyj, G.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700722.

More than 100 neutron spectra under different regimes of accelerator operation are studied to systematize and generalize the data on spectral composition of neutrons behind the IHEP accelerator shields. Thirty low-energy spectra characteristic to working rooms are presented in the paper. A method of the Bonner spectrometer is chosen for spectral analysis of neutrons. The resolution of neutron spectra presented in the given paper has been made by the PENS program within the energy range from 0.5 eV to 200 MeV. The given data testify unambiguously to the constructivity of the proposed classification of neutron spectra. A possibility is appeared with its help for apriory estimate of expected spectra of neutron depending on material and dimensions of the shield as well as on source-detector geometry. 7 refs.; 5 figs.; 2 tabs.

16558 (INIS-SU—370, pp 18-22) **On the proton beam characteristic detection in a cyclotron on multiple beam passage through a target.** Barit, I.Ya.; Katsaurov, L.N.; Nechaeva, L.P.; Khokhlov, Yu.K. (AN SSSR, Moscow. Inst. Yadernykh Issledovanij). 1984. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE87780078.

In Experimental and theoretical physics. Collection.

Technique for measuring of proton beam intersecting a thin target made of Al/sub 2/O/sub 3/ in the 600 keV sector cyclotron and for measuring energy spread of accelerated ions in this beam is described. Percentage composition of each portion of the beam incident onto the target is measured using the differential monitor. The target, which detected both the beam passage through it and relative beam intensity in each cycle, was used as a signal electrode. To measure increaments of the current and energy spread at the expense of multiple beam passage through a target, energy spectra of protons scattered on a target during single and multiple passage are compared. It is found out that during multiple beam passage current value increases 6 times as compared to single passage, and energy spectrum width increases from 19 KeV up to 34 keV.

16559 **(IPNO-DRE—85-16) Production of secondary radioactive beams from 44 MeV/u Ar projectiles.** Bimbot, R.; Della Negra, S.; Aguer, P.; Bastin, G.; Anne, R.; Delagrange, H.; Hubert, F. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1985. 52p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87750758.

Secondary beams have been produced through interaction of a 1760 MeV Ar beam with a 99 mg/cm^2 Be target. An achromatic spectrometer is used to select the magnetic rigidity corresponding to a given beam, and to transport this beam over a distance of about 18 m. The beam purity is studied using a solid state ΔE-E telescope. Beams of ^{35}S and ^{39}Cl are produced with a purity of about 80% and production rates of 1.5 10^{-6} Isub(o) and 5.10^{-5} Isub(o) respectively. Here Isub(o) denotes the primary beam intensity. Beams of ^{36}Ar, ^{39}Ar and ^{41}Kr are produced with about the same abundances as ^{39}Cl but with lower purities. It is shown that, by setting properly the experimental parameters, the beam production can be improved by a factor 2 to 5. This could lead to intensities of about 2.10^6 pps for ^{35}S and of 10^7 to 10^8 pps for the four other beams. The possibility of purifying these beams by placing a degrader between the two dipoles of the spectrometer is shown experimentally.

16560 **(JINR—13-85-306) Pulse voltage generator for electron cannon supply.** (Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of New Acceleration Methods). 1985. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701327.

Submitted to the journal Instrum. Exp. Tech. .

Results of experimental investigation of interruption of current flowing through the hydrogen thyratron being in the longitudinal magnetic field of the short magnetic lens, are presented. The pulse voltage generator is developed on the basis of this phenomenon. Condensator and induction energy accumulators for the generator electron gun supply are combined. 6 refs.; 6 figs.; 1 tab.

16561 **(JINR—R-13-85-256) Some proposals on mass separation, precision mass spectrometry and acceleration of radioactive nuclides.** (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1985. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701339.

A possible variant of the magnetic analyzer of the mass separator on the accelerated charge particle beam is proposed. The possibility of using static multirevolution mass spectrometer with ion velocity focusing on the beam of mass separate radioactive nuclides for direct mass measurement is considered. The possibilities of using relatively small cyclotron with variation of the plane symmetric magnetic field for the acceleration of mass separated radioactive nuclides is consideredd. 3 refs.

16562 **(KIYI—86-34) Influence of the crater at the target surface on the ion outflow from laser produced plasma.** Dem'yanov, A.V.; Kononov, A.V.; Linev, A.F. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 9p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700841.

A rig of ion sources is described that is modified for investigation of ion composition, extracted from the plasma of a laser source. Experimental results and its brief discussion are presented. Al/sup +/, Al/sup +2/, Al/sup +3/ ions are obtained from plasma, produced by focused radiation of Nd-laser (flux density of radiation at the target approximately 10/sup 9/ W/cm/sup 2/). A decrease of ion outflow is detected due to the crater formation at the target surface. 8 refs.; 4 figs.

16563 **(LA-UR—86-3861) Operation of a magnetically filtered multicusp volume source.** Stevens, R.R. Jr.; York, R.L.; Leung, K.N.; Ehlers, K.W. (Los Alamos National Lab., NM (USA); Lawrence Berkeley Lab., CA (USA)). 1986. Contract W-7405-ENG-36. 12p. (CONF-8610115—19). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005131.

From 4. international symposium on the production and neutralization of negative ions and beams; Upton, NY, USA (27 Oct 1986).

The results of experimental studies on an optimized version of the Lawrence Berkeley Laboratory (LBL) volume source are presented. Negative ion yields and emittance data were obtained for operation with both H^- and D^- beams. At high arc power, H^- beam currents up to 10 mA with rms normalized emittances of 0.0080 π.cm.mrad were obtained from a 6.3-mm-dia emission aperture. The yields of D^- beams were approximately half those of H^- beams, and the normalized emittances were 1.7 times smaller at the same current density. The results of these studies indicate that the present operation is limited by the extraction system rather than the ion source.

16564 **(LA-UR—86-3863) Spectroscopic investigation of H^- and D^- ion source plasmas.** Smith, H.V. Jr.; Allison, P.; Keller, R. (Los Alamos National Lab., NM (USA)). Oct 1986. Contract W-7405-ENG-36. 13p. (CONF-8610115—18). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005130.

From 4. international symposium on the production and neutralization of negative ions and beams; Upton, NY, USA (27 Oct 1986).

Several H I (Balmer), Cs I, Cs II, and Mo I lines emitted by the small-angle source and 4X source plasmas are studied. After correcting for Stark broadening, the H/sub α/ line width gives the H-atom temperature kT/sub H/o. After correcting for Doppler broadening, the H/sub β/ and H/sub δ/ line widths give the electron density n/sub e/. For pulsed operation of both sources, kT/sub H/o is 1.5 to 2 eV and n/sub e/ is 1 to 2 x 10^{14}/cm^3, with kT/sub H/o and n/sub e/ scaling approximately with the square root of the discharge current. For the 4X source operated on D_2, kT/sub D/o and n/sub e/ are near the values of kT/sub H/o and n/sub e/ obtained for H_2 operation. Assuming that the H^-/D^- ion temperature equals the H/D-atom temperature, we deduce a lower limit to the H^-/D^- beam emittance.

16565 **(LBL—21293) Heater induced quenches in SSC [Superconducting Super Collider] model dipoles.** Hassenzahl, W.V. (Lawrence Berkeley Lab., CA (USA)). Oct 1986. Contract AC03-76SF00098. 7p. (CONF-860914—27). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003524.

From Applied superconductivity conference (ASC '86); Baltimore, MD, USA (28 Sep 1986).

A 1-m long SSC dipole constructed at the Lawrence Berkeley laboratory was subjected to a series of heater induced quenches to determine: axial quench propagation velocities, transverse quench propagation, and conductor temperature rise. Quenches were produced by 3 heaters at different locations in the magnet and at several currents. The results of these studies are described and are compared to previously published theoretical studies of quenches on the SSC dipoles. These results are shown to be in agreement with the calculations of the program "QUENCH", which includes an increase of the quench velocity during the first few milliseconds of the quench.

16566 **(LBL—22445) H^- ion source scaling studies at LBL.** Lietzke, A.F.; Hauck, C.A. (Lawrence Berkeley Lab., CA (USA)). Oct 1986. Contract AC03-76SF00098. 16p. (CONF-8610115—15). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004476.

From 4. international symposium on the production and neutralization of negative ions and beams; Upton, NY, USA (27 Oct 1986).

Four experiments are reported. Constant arc voltage operation was compared with constant arc current operation over a similar range of plasma density. The higher arc voltage required in the constant arc current operation produced more H^-, but it was at the expense of an even larger increase in the accelerated electron current. A comparison of different magnetic filter locations showed the highest accelerated H^- and the lowest e^- content at the closest filter location. Beam-forming electrode aperture comparison for round apertures from 2mm to 10mm diameters and a 11 x 27 mm oval slot showed a decreasing H^- and e^- with increasing aperture area. Increasing accelerator voltage produced an increasing plasma potential and electron temperature and decreasing electron density in the exit chamber of the plasma source.

16567 **(LBL—22450) ECR [Electron Cyclotron Resonance] ion sources for cyclotrons.** Lyneis, C.M. (Lawrence Berkeley Lab., CA (USA)). Oct 1986. Contract AC03-76SF00098. 35p. (CONF-8610209—1). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87003532.

From RCNP/Kikuchi summer school on accelerator technology; Osaka, Japan (20 Oct 1986).

In the last decade ECR (Electron Cyclotron Resonance) ion sources have evolved from a single large, power consuming, complex prototype into a variety of compact, simple, reliable, efficient, high performance sources of high charge state ions for accelerators and atomic physics. The coupling of ECR sources to cyclotrons has resulted in significant performance gains in energy, intensity, reliability, and variety of ion species. Seven ECR sources are in regular operation with cyclotrons and numerous other projects are under development or in the planning stag. At least four laboratories have ECR sources dedicated for atomic physics research and other atomic physics programs share ECR sources with cyclotrons. An ECR source is now installed on the injector for the CERN SPS synchrotron to accelerate O^{8+} to relativistic energies. A project is underway at Argonne to couple an ECR source to a superconducting heavy-ion linac. Although tremendous progress has been made, the field of ECR sources is still a relatively young technology and

there is still the potential for further advances both in source development and understanding of the plasma physics. The development of ECR sources is reviewed. The important physics mechanisms which come into play in the operation of ECR Sources are discussed, along with various models for charge state distributions (CSD). The design and performance of several ECR sources are compared. The 88-Inch Cyclotron and the LBL ECR is used as an example of cyclotron+ECR operation. The future of ECR sources is considered.

16568 (NIIEFA-P-E—0671) **Calculation of strain-stressed state of the tyre system of superconducting dipole magnets.** Eregin, V.E.; Lamzin, E.A. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1984. 17p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700844.

The problem dealing with determination of strain-stressed state (SSS) of demountable tyre constructions of superconducting dipole magnets is considered. Solution algorithm and numerical calculation results based on the COLLAR program SSS of one of the tyre constructions of the superconducting magnet for accelerating-storage complex are presented. 13 refs.; 5 figs.

16569 (TRI-PP—86-86) **The TRIUMF kaon factory proposal.** Hutcheon, D.A. (TRIUMF, Vancouver, British Columbia (Canada)). Oct 1986. 5p. (CONF-8610196—4). NTIS (US Sales Only), PC A02/MF A01. File Number DE87900303.

From European workshop on few body physics; Rome, Italy (7 Oct 1986).

TRIUMF has recently proposed a kaon factory, consisting of a group of accelerators to produce a 100 μA, 30 GeV proton beam. The science program, the system of accelerators, the experimental area, and the current status of the proposal are described.

16570 **Design and modeling considerations for SSRL Beam Line Wunder.** Bachrach, R.Z.; Bringans, R.D.; Hower, N.; Lindau, I.; Pate, B.B.; Pianetta, P.; Swartz, L.E.; Tatchyn, R. (Xerox Palo Alto Research Center, 3333 Coyote Hill Rd., Palo Alto, CA 94304). pp 10-15 of Science with soft x-rays. Himpsel, F.J.; Klaffky, R.W. Bellingham, WA; SPIE Society of Photo-Optical Instrumentation Engineers (1983). (CONF-8310172—).

From Advances in soft x-ray science and technology conference; Upton, NY, USA (17 Oct 1983).

Standford Synchrotron Radiation Laboratory (SSRL) Beam Line Wunder will be the first soft X-ray energy range synchrotron radiation beam line specifically designed to exploit the unique aspects of periodic insertion devices in the wiggler-undulator (wunder) regime. Aspects of the development of this beam line are described. The authors emphasize the joint Optical, Thermal, and Mechanical optimization studies that were required.

4304 Storage Rings

REFER ALSO TO CITATION(S) 16532, 16533

16571 (BNL—39057) **Modes of storage ring coherent instabilities.** Wang, J.M. (Brookhaven National Lab., Upton, NY (USA)). Dec 1986. Contract AC02-76CH00016. 93p. (CONF-850768—12). NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87005256.

From SLAC summer institute on particle physics; Stanford, CA, USA (29 Jul 1985).

Longitudinal impedance in a beam and various modes of longitudinal coherent instabilities are discussed. The coasting beam coherent instability, microwave instability, and single-bunch longitudinal coherent instabilities are considered. The Vlasov equation is formulated, and a method of solving it is developed. The synchrotron modes are treated, which take the possible bunch shape distortion fully into consideration. A method of treating the synchrotron mode coupling in the case of a small bunch is discussed which takes advantage of the fact that only a few of the synchrotron modes can contribute in such a case. The effect of many bunches on the coherent motion of the beam and the longitudinal symmetric coupled bunch modes are discussed. The transverse impedance is then introduced, and the transverse coasting beam instability is discussed. Various bunched beam instabilities are discussed, including both single bunch instabilities and coupled bunch instabilities. The Vlasov equation for transverse as well as longitudinal motion of particles is introduced as well as a method of solving it within a linear approximation. Head-tail modes and short bunch instabilities and strong coupling instabilities in the long bunch case are covered. (LEW)

16572 (BNL—51959, pp 29-35) **PF experimental hall and some selected current topics in SR experiments.** Ando, M.; Ohta, T. (National Lab. for High Energy Physics, Tsukuba, Japan). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The following topics from storage ring experiments are discussed; floor space, cranes, floor stability, radiation safety, imaging plates, plane wave x-ray topography, white and monochromatic x-ray topography, coronary angiography, electron neutrino mass, x-ray magnetic scattering, x-ray lithography, and photochemical vapor deposition.

16573 (BNL—51959, pp 36-49) **Berlin Electron Storage Ring BESSY: a dedicated XUV synchrotron radiation facility.** Muelhaupt, G.; Bradshaw, A.M. (Berliner Elektronenspeicherring-Gesellschaft fuer Synchrotronstrahlung mbH (BESSY), Berlin, West Germany). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

In response to national requirements in the fields of basic research, metrology and x-ray lithography it was decided in late 1977 to build a dedicated XUV synchrotron radiation source in Berlin. The history of the BESSY project, the user-oriented factors that determined the design parameters, the construction and commissioning of the facility as well as user operation and funding issues are reviewed.

16574 (BNL—51959, pp 50-74) **Origins, and the construction, commissioning and operation of the SRS.** Thompson, D.J. (SERC Daresbury Lab., Warrington, England). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The SRS was initiated in 1973 and approved in 1975. It came into use in 1981. The paper describes the organizational framework at the different stages, the pre-approval, construction, commissioning and operational phases of the storage ring, the build-up of experimental stations, and future plans. The emphasis is on lessons which can be learned by those about to embark on such a project, rather than on a detailed historical account, and on managerial rather than physics matters.

16575 (BNL—51959, pp 75-82) **Status of ADONE as synchrotron radiation source.** Bartalucci, S. (National Institute for Nuclear Physics, Frascati, Italy). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The first application of synchrotron radiation (SR) at Frascati started in 1965 which exploited the light coming from the electron-synchrotron for absorption and reflectivity measurements in the X-VUV region. Ten years later a project for the utilization of Synchrotron Light (PULS) was set up and the convention establishing the PULS collaboration was signed by the National Research Council (CNR) and the National Institute for Nuclear Physics (INFN). From 1975 to 1980 an experimental facility was built

around the photon beam line originating from a bending magnet of the storage ring ADONE. In 1975 the construction of a wiggler magnet for both machine physics studies and production of hard X rays was decided by the INFN. The wiggler was installed in 1978 on a straight section of ADONE and the compatibility with the normal operation of ADONE was demonstrated successfully. Also, a laboratory for the utilization of synchrotron light from this magnet (PWA) was built by INFN and inaugurated in May 1985. The present status of the storage ring ADONE is discussed and the main features of the SR facility are described.

16576 (BNL—51959, pp 83-97) **Overview of the UVSOR facility.** Kasuga, T.; Watanabe, M. (Institute for Molecular Science, Myodaiji, Japan). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The Ultraviolet Synchrotron Orbital Radiation (UVSOR) Facility is a dedicated VUV source for studies of molecular science and related fields. It is a 600 MeV (max 750 MeV) electron storage ring, of which the injector is a 600 MeV synchrotron with a 15 MeV linac. They are located underground for radiation safety. Synchrotron radiation from ordinary bending sections is mainly utilized. Three insertion devices can be installed. The UVSOR Facility was first proposed in 1975. The construction started in 1980 with fabrication of measurement systems. In 1981, the construction of the light source started and its commissioning occurred on November 10, 1983. The commissioning and operation of the facility are described.

16577 (BNL—51959, pp 98-102) **University-based user facilities: lessons from Tantalus and Aladdin.** Huber, D.L. (Univ. of Wisconsin, Madison). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The establishment of university-based user facilities is a relatively new development in the federal funding of research in condensed matter science. Because the Synchrotron Radiation Center (SRC) has been a pioneer user facility, a certain degree of experience, both good and bad, has been acquired in the construction and operation of university-based facilities for synchrotron-related research. The history of SRC is discussed and some of the general lessons learned in the area of advanced planning are outlined. No attempt is made to be either definitive or exhaustive. In the present context, a university-based user facility is understood to be a dedicated facility under direct university control where a majority of the users come from outside the local university community.

16578 (BNL—51959, pp 103-113) **Present status of SOR-RING.** Ishii, T.; Isoyama, G. (Univ. of Tokyo, Japan). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The present status of the SOR-RING, its initial commissioning and recent activity of the facility are described. The major steps taken during the initial commissioning were the replacement of the RF cavity, cleaning the vacuum chambers, refining the magnet system, and continual search for the best operating point. Experience with single bunch mode of operation and efforts to improve beam stability are also described.

16579 (BNL—51959, pp 114-125) **Orsay synchrotron radiation sources complex.** Sommer, M. (Laboratoire pour l'Utilization du Rayonnement Electromagnetique, Orsay, France). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

Since the early seventies, synchrotron radiation from the then existing circular colliders (ACO and later DCI) was used. This collaboration with the LAL High Energy Physics Laboratory was fruitful, and both machines are now dedicated for synchrotron radiation. These machines are discussed. In the early eighties it was obvious that a low emittance VUV source was a necessity. This is Super-ACO, now in construction. The properties of this machine are also summarized.

16580 (BNL—51959, pp 126-132) **Beijing Electron Positron Collider (BEPC) project.** Xie Jialin. (Institute of High Energy Physics, Beijing, China). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

BEPC is China's first high energy accelerator project which is being built to serve the dual purposes of carrying out particle physics studies on one hand and conducting synchrotron radiation experiments on the other. This project was formally approved at the end of 1983, and is scheduled to be completed at the end of 1988. Construction is in full swing. A brief account of the design, progress, and management of the project is presented.

16581 (BNL—51959, pp 133-140) **Compact synchrotron radiation source.** Liu, N.; Wang, T.; Tian, J.; Lin, Y.; Chen, S.; He, W.; Hu, Y.; Li, Q. (Tsinghua Univ., Beijing, China). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

A compact 800 MeV synchrotron radiation source is discussed. The storage ring has a circumference of 30.3 m, two 90 degree and four 45 degree bending magnet sections, two long straight sections and four short straight sections. The radius of the bending magnet is 2.224m. The critical wave length is 24A. The injector is a 15 Mev Microtron Electrons are accelerated from 15 Mev to 800 Mev by ramping the field of the ring. The expected stored current will be around 100 ma.

16582 (BNL—51959, pp 141-147) **Present status of the SRRC Project.** Chang, C.; Cheng, K.C.; Liu, Y.C.; Tseng, P.K. (Institute of Nuclear Energy Research, Lungtan, Taiwan). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

Upon the recommendation of the overseas Chinese scholars and the feasibility study group organized by the National Science Council, the government approved the establishment of the Synchrotron Radiation Research Center (SRRC) on July 9, 1983. The main goal of the SRRC project is to construct and operate an up-to-date 1 GeV synchrotron radiation source, with three beam lines for general experiments, in five to six years; to provide local scientists and returned scientists from abroad a facility to carry out frontier researches in both basic and applied science; and to elevate the technological capabilities of the related industries, universities, and research institutes through the construction of the machine. The background and present status of the project are discussed.

16583 (BNL—51959, pp 148-154) **HESYRL: a dedicated synchrotron radiation laboratory in China.** Qiu, L.J. (Univ. of Science and Technology of China, Anhui). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The HESYRL national synchrotron radiation laboratory was first proposed in 1977 as a conclusion of a general planning meeting on nationwide development of natural science and technology at which a topic was the application of synchrotron radiation. A study group was formed in 1978 to carry out preliminary research and prototype development work. The final approval of the project was given in April 1983 and the lab was soon founded. Designs of the main facilities and building completed in Oct 1984. The ground breaking was in Nov 1984. Manufacturing and purchasing of all the

equipment and components are now in progress. The overall layout of HESYRL project is shown. the main facilities are an 800 MeV electron storage ring, a 88 meter transport line and a 240 MeV linac as the injector. Some basic considerations in the selecting of major machine parameters are discussed.

16584 (BNL—51959, pp 155-166) **Design and status of Hefei light source.** Ho, T. (Univ. of Science and Technology of China, Anhui). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

Construction of a dedicated UV synchrotron radiation source is now underway at University of Science and Technology of China, Hefei, Anhui, China, and it is named as the Hefei National Synchrotron Radiation Laboratory (HESYRL). The facility was proposed in 1977 and authorized in 1983. The construction was started in October, 1984 and is expected to be completed in 1988. The purpose of the project is to meet the rapidly growing needs for applying synchrotron radiation in many fields, such as atomic and molecular physics, surface physics, chemistry, biology, medicine, material science, radiation metronology and lithography, etc. A general description of the facility is presented.

16585 (BNL—51959, pp 167-174) **Plan and present status of synchrotron radiation applications at HESYRL.** Zhang, Y.; Su, Y.; Qian, S.; Xu, X.; Jiang, D.; Xu, C. (Univ. of Science and Technology of China, Anhui). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

An 800 MeV electron storage ring is being constructed at Hefei, China. It is a dedicated UV synchrotron light source from which 27 beam lines could be extracted to accommodate about 50 experimental stations. Four beam lines and five stations are planned and some instruments have been designed and are under construction for the first five-year plan. The proposed experiments include x-ray lithography, soft x-ray microscopy, photoelectron spectroscopy, time-resolved spectroscopy and photochemistry.

16586 (BNL—51959, pp 188-194) **SUPER-ACO the new Orsay dedicated synchrotron radiation source.** Sommer, M. (Laboratoire pour l'Utilization du Rayonnement Electromagnetique, Orsay, France). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

Super-ACO is a 0.8 GeV storage ring optimized for low emittance and multi-insertions. A maximum of straight sections are installed in order to manage place for six insertions.

16587 (BNL—51959, pp 195-204) **European Synchrotron Radiation Facility.** Buras, B. (Riso National Lab., Roskilde, Denmark). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

How a European Synchrotron Radiation Facility has developed into a detailed proposal recently accepted as the basis for construction of the facility at Grenoble is discussed. In November 1977, the General Assembly of the European Science Foundation (ESF) approved the report of the ESF working party on synchrotron radiation entitled Synchrotron Radiation - a Perspective View for Europe. This report contained as one of its principal recommendations that work should commence on a feasibility study for a European synchrotron radiation laboratory having a dedicated hard X-ray storage ring and appropriate advanced instrumentation. In order to prepare a feasibility study the European Science Foundation set up the Ad-hoc Committee on Synchrotron Radiation, which in turn formed two working groups: one for the machine and another for instrumentation. This feasibility study was completed in 1979 with the publication of the Blue Book describing in detail the so called 1979 European Synchrotron Radiation Facility. The heart of the facility was a 5 GeV electron storage ring and it was assumed that mainly the radiation from bending magnets will be used. The facility is described.

16588 (BNL—51959, pp 205-219) **Brazilian Synchrotron Radiation Project.** Rodrigues, A.R.D.; Lobo, R. (Instituto de Fisica e Quimica, Sao Carlos, Brazil). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—).

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The proposal for a Brazilian national laboratory for synchrotron radiation is presented. The first design study led to a system consisting of a LINAC, an injection ring and a low emittance storage ring. The main ring is designed to be upgraded to 3GeV with an emittance of 4×10^{-8} rad.m. The design study also indicated the possibility of using the injection ring as a soft x-Rays/VUV source.

16589 (BNL—51959, pp 220-230) **Advanced Light Source, a 1-2 GeV synchrotron radiation facility.** Berkner, K.H. (Lawrence Berkeley Lab., CA). Oct 1985. NTIS, PC A11/MF A01. File Number DE87004151. (CONF-8510357—). Contract AC03-76SF00098.

From Workshop on the construction and commissioning of dedicated synchrotron radiation facilities; Upton, NY, USA (16 Oct 1985).

The Advanced Light Source (ALS), a dedicated synchrotron radiation facility optimized to generate soft x-ray and vacuum ultraviolet (XUV) light using magnetic insertion devices, was proposed by the Lawrence Berkeley Laboratory in 1982. It consists of a 1.3-GeV injection system, an electron storage ring optimized at 1.3 GeV (with the capability of 1.9-GeV operation), and a number of photon beamlines emanating from twelve 6-meter-long straight sections. In addition, 24 bending-magnet ports will be available for development. The ALS was conceived as a research tool whose range and power would stimulate fundamentally new research in fields from biology to materials science. The conceptual design and associated cost estimate for the ALS have been completed and reviewed by the US Department of Energy (DOE), but Title I activities have not yet begun. The focus in this study is on the history of the ALS as an example of how a technical construction project was conceived, designed, proposed, and validated within the framework of a national laboratory funded largely by the DOE.

16590 (CERN—86-06) **Theoretical aspects of some collective instabilities in high-energy particle storage rings.** Ruggiero, F. (European Organization for Nuclear Research, Geneva (Switzerland)). 8 Aug 1986. 64p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87700667.

After an introduction to single-particle dynamics, based on a unified Hamiltonian treatment of betatron and synchrotron oscillations, we consider two examples of collective instabilities which can limit the performances of high-energy storage rings: the transverse mode coupling instability, due to wake fields, and the incoherent beam-beam instability. Special emphasis is placed on the localization of the interactions between particles and surrounding structures, such as the accelerating RF cavities. We derive an exact invariant for the linearized synchrotron motion and, starting from the Vlasov equation, we discuss the coherent synchro-betatron resonances caused by localized impedance. Under suitable assumptions, we show that the effect of the beam-beam kicks in electron-positron machines can be described by new diffusive terms in a "renormalized" Fokker-Planck equation and is therefore equivalent to an additional source of noise for the betatron oscillations.

16591 (CONF-861114—28) **The Heidelberg test storage ring for heavy ions and its use for atomic physics.** Schuch, R. (Heidelberg Univ. (Germany, F.R.). Physikalisches Inst.). Nov 1986. Contract AC05-84OR21400. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87002811.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

A brief description of the Heavy-Ion Test Storage Ring (TSR) presently being built at the Max-Planck Institut in Heidel-

berg is given. It will be able to store ions injected from the tandem postaccelerator combination up to about 30 MeV/nucleon for a charge to mass ratio of 0.5. One of the main purposes of the TSR will be the study of electron cooling. Some atomic physics experiments are discussed using the electron cooling device which provides an electron-ion collision facility with good energy resolution and ion beams of high currents and low emittances. Here the possibilities for measurements of spontaneous and laser-induced radiative recombination and dielectronic recombination in the electron cooling section are discussed.

16592 **(EFI—800(27)-85) Space-angular distribution of Synchrotron radiation power in electron storage rings with account of betatron oscillations.** Tsakanov, V.M. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700687.

The space-angular distribution of synchrotron radiation (SR) power with account of betatron oscillations is examined. The distribution of SR power in the phase space (Xo, Xo', Yo, Yo') in the centre of radiation source is obtained, when the stationary electron distribution in the phase space (x, x', y, y') is available. The dependence of SR brightness on the electron storage ring structure and betatron oscillation frequencies is discussed. 11 refs.; 6 figs.; 1 tab.

44 INSTRUMENTATION

16593 **(BARC—1255) Biennial report for 1982 and 1983 of Electronics Division.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 54p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87701250.

The research and development activities of the Electronics Division of the Bhabha Atomic Research Centre, Bombay during the years 1982 and 1983 is presented in the form of individual summaries arranged under the headings: reactor instrumentations, nuclear instruments, medical instrumentation, local area network, general instruments. Other activities of the Division such as servicing of electronic equipments, provision of wiring and PCB facilities to computer network and micro based systems, training etc are also decribed in brief. A list of staff-members is given at the end.

4401 Radiation Instrumentation

From Summer study on the physics of the superconducting super collider ↑; 0.

An ad hoc group at Snowmass reviewed the need for detector simulation to support detectors at the SSC. This report first reviews currently available programs for detector simulation, both those written for single specific detectors and those aimed at general utility. It then considers the requirements for detector simulation for the SSC, with particular attention to enhancements that are needed relative to present programs. Finally, a list of recommendations is given.

16595 **(BNL—39104) Computerized microtomography using synchrotron radiation from the NSLS [National Synchrotron Light Source].** Spanne, P.; Rivers, M.L. (Brookhaven National Lab., Upton, NY (USA); Chicago Univ., IL (USA). Dept. of Geophysical Sciences; Linkoeping Univ. (Sweden). Dept. of Radiation Physics). Sep 1986. Contract AC02-76CH00016. 16p. (CONF-861114—43). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005252.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

Results of microtomography experiments that employ filtered radiation from the National Synchrotron Light Source X-26 Microprobe beam line are presented. These experiments have yielded images of a freeze-dried caterpillar with a spatial resolution of the order of 30 μm and show that the limit on the spatial resolution with the present apparatus will be 1 to 10 μm. Directions for improvement in synchrotron microtomography techniques and some possible applications are discussed. 14 refs., 3 figs.

16596 **(CEA-CONF—8400) Studying reactor antineutron oscillations with large underground detectors.** Lagage, P.O. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). Feb 1986. 7p. (CONF-860167—7). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750559.

From Recontres de Moriond workshop on massive neutrinos in particle physics and astrophysics; Tignes, Savoie, France (25 Jan 1986).

The various nuclear reactors on the planet induce a sizeable antineutrino background in most underground laboratories. In this paper, I discuss the possibility of studying neutrino oscillations on relatively large distances by detecting these antineutrinos in large underground detectors, like those currently proposed.

16597 **(CNIC—00010) Method of processing data and evaluating uncertainty in $4\pi\beta$-γ coincidence measurement.** (China Nuclear Information Centre, Beijing, BJ). Apr 1986. 11p. (In Chinese). (IAE—0010). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701280.

According to the principle of coincidence measurement, using probable statistics method, the method of processing data and evaluating uncertainty of $4\pi\beta$-γ coincidence measurement are inferred and summarized systematically. Computer programs written in Algol-60 and Fortran have overcome some shortcomings in normal calculation methods, reduced the calculation errors and have the advantages of strictness, systematization, completeness, fast speed and high efficiency. It can be widely used for calculating the radioactivity of many nuclides with various decay models.

16598 (CONF-860203—, pp 311-320) **Portable wide range instrument for beta radiation monitoring with minimum angular dependence.** Milakovic, J.; Frank, G.W.; Slobodien, M.J. (GPU Nuclear Corp., Middletown, PA). Dec 1986. NTIS $23.00. File Number DE86900357.

From 19. midyear topical symposium on health physics considerations in decontamination and decommissioning; Knoxville, TN, USA (2 Feb 1986).

Most commercially available instruments used for radiation monitoring have great directional dependence when used in beta radiation fields. This directional dependence can result in underestimating the beta radiation fields from areas with large amounts of surface contamination. Such conditions exist at the Three Mile Island Unit 2 plant as a result of deposits of primary coolant on floors, walls, pipes, cable trays, and the like. The Radiological Instrument Group at TMI developed a directionally independent beta/gamma ionization chamber detector for use with a Eberline Instrument RO-7. The probe is suitable for use in radiation field intensities from 0-20 krad per hour. The ionization chamber is an inexpensive adaptation of commercially available equipment. Tests using beta radiation from a Sr-90/Y-90 placque indicated that the angular response varied from 75% to 100% of true dose rate compared with 0-100% with the conventional RO-7 probe. The modification did not significantly alter the beta correction factor and still provided adequate buildup for accurate evaluation of gamma radiation exposure rates at 0.66 MeV (Cs-137). This paper provides construction details and results of tests for angular dependence, axial symmetry, and beta energy response using the isotopes Pm-147 (E/sub max/ .224 MeV), Tl-204 (E/sub max/ .76 MeV), and Sr-90/Y-90 (E/sub max/ 2.3 MeV).

16599 **(CONF-860961—8) Advanced research in instrumentation and control technology: Acoustic parameter studies.** Sheen, S.H.; Bobis, J.P.; Raptis, A.C. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 11p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004662.

From Instrumentation, components and materials contractors' meeting; Morgantown, WV, USA (16 Sep 1986).

In the process of developing acoustic/ultrasonic instruments for coal conversion and combustion processes, there is a need to understand various complex relations between acoustic parameters and physical properties of coal/gas and coal/liquid media so that the instrument readings and measurement accuracy can be evaluated and new sensing techniques can be developed. The primary objective of this project is to examine the theory and perform measurements of acoustic/ultrasonic parameters in such coal media. The acoustic parameters of interest are sound speed, attenuation, scattering pattern, and resonance scattering, which relate directly or indirectly to coal concentration, particle size and distribution, and rheological and thermal properties. In summary, we have developed a laboratory technique for accurate attenuation measurement in highly viscous liquids and coal slurries. For pure liquids, the attenuation in low frequency (0.8 to 2 MHz) provides a direct measurement of fluid shear viscosity. For coal slurries of low concentration (<10% by weight) attenuation in the same frequency range still follows the variation of fluid viscosity. But, for slurries of higher coal concentration, anomalous attenuation may be measured, depending on the fluid structure, which is believed to be a micor-inhomogeneous medium. 8 refs., 5 figs., 1 tab.

16600 **(CONF-861007—23) CCD[charge-coupled device]-based synchrotron x-ray detector for protein crystallography: Performance projected from an experiment.** Strauss, M.G.; Naday, I.; Sherman, I.S.; Kraimer, M.R.; Westbrook, E.M. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 8p. NTIS, PC A02. File Number DE87004956.

From Nuclear science and nuclear power systems symposium; Washington, DC, USA (29 Oct 1986).

The intense x radiation from a synchrotron source could, with a suitable detector, provide a complete set of diffraction images from a protein crystal before the crystal is damaged by radiation (2 to 3 min). An area detector consisting of a 40 mm dia. x-ray fluorescing phosphor, coupled with an image intensifier and lens to a CCD image sensor, was developed to determine the effectiveness of such a detector in protein crystallography. The detector was used in an experiment with a rotating anode x-ray generator. Diffraction patterns from a lysozyme crystal obtained with this detector are compared to those obtained with film. The two images appear to be virtually identical. The flux of 10^4 x-ray photons/s was observed on the detector at the rotating anode generator. At the 6-GeV synchrotron being designed at Argonne, the flux on an 80 x 80 mm^2 detector is expected to be $>10^9$ photons/s. The projected design of such a synchrotron detector shows that a diffraction-peak count $>10^6$ could be obtained in ~0.5 s. With an additional ~0.5 s readout time of a 512 x 512 pixel CCD, the data acquisition time per frame would be ~1 s so that ninety 1° diffraction images could be obtained, with approximately 1% precision, in less than 3 min.

16601 **(CONF-8606241—5) Note on electron spectrometer requirements for deep inelastic scattering studies.** Jackson, H.E. Jr. (Argonne National Lab., IL (USA)). 1986. Contract W-31-109-ENG-38. 3p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87001557.

From 3. Continuous Electron Beam Accelerator Facility summer school; Newport News, VA, USA (23 Jun 1986).

The limitations placed on deep inelastic hadron production studies by a minimum electron spectrometer angle of 10° is discussed.

16602 **(CRN-CPR—84-1) Streak camera and picosecond metrology of laser impulses running at high repetitive rates.** Geist, P.; Martz, A.; Heisel, F.; Miehe, J.A. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires). 1984. 48p. (In French). NTIS (US Sales Only), PC A03/MF A01. File Number DE87750453.

Some experimental configurations of a streak camera used with a synchronous pumped dye laser or with a repetitive mode-locked and Q-switched laser are described. The overall performances are discussed with respect to synchronous and triggered operating modes of the streak camera.

16603 **(EFI—735(50)-84) Monte-Carlo simulation of electromagnetic showers.** Amatuni, Ts.A. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1984. 56p. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE87700669.

The universal ELSS-1 program for Monte Carlo simulation of high energy electromagnetic showers in homogeneous absorbers of arbitrary geometry is written. The major processes and effects of electron and photon interaction with matter, particularly the Landau-Pomeranchuk-Migdal effect, are taken into account in the simulation procedures. The simulation results are compared with experimental data. Some characteristics of shower detectors and electromagnetic showers for energies up 1 TeV are calculated. 37 refs.; 9 figs.; 8 tabs.

16604 **(EFI—789(16)-85) On the possibility of using a neutron supermonitor in the ANI complex experiment.** Babayan, Kh.P. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700681.

The possibility of defining the spatial distribution of low energy hadrons in extensive air showers using the standard 18-NM-64 neutron supermonitor is considered. 15 refs.; 2 figs.

16605 **(EFI—792(19)-85) EhLEKTRON magnetic spectrometer calibration.** Bagdasaryan, D.S.; Boyakhchyan, E.M.; Kazaryan, G.B.; Karibyan, M.D.; Markaryan, Eh.R.; Mkrtchyan, G.G. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700683.

Characteristics of the Ehlectron spectrometer are experimentally investigated. The comparison of the results of Monte Carlo calculations with experiment shows a good consistency of real and expected parameters of the setup. The setup is calibrated by the measurement of the process of elastic ep scattering using the subtraction method. 5 refs.; 8 figs.; 1 tab.

16606 **(EFI—794(21)-85) Identification of electrons by means of a scintillation telescope at Esub(e) = 1-3 GeV.** Bagdasaryan, D.S.; Karibyan, M.D.; Kazaryan, G.B. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700685.

Characteristics of a telescope counter including three scintillation detectors and lead converter are given. It is shown that the hadron (π/sup -/) quenching factor of the order of 2.5 x 10/sup -2/ may be obtained by chaosing the radiator thickness on the maximum of the electromagnetic cascade by a system of 3 scintillation counters at the electron detection with the efficiency of about 95% in the momentum range of 1-2.5 GeV/c. The telescope considered is a part of the Ehlektron magnetic spectrometer detecting equipment. 6 refs.; 6 figs.

16607 **(EFI—803(30)-85) Sandwich nuclear emulsion emitter-detector-emitter systems with regulated sensitivity.** Akopova, A.B.; Arutyunyan, M.M.; Kartuzhanskij, A.L.; Magradze, N.V.; Moiseenko, A.A.; Ovnanyan, K.M.; Chalabyan, T.S. (Erevanskij Fizicheskij Inst. (USSR)). 1985. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700688.

The method of decelerated development of multicharge particle trace in 200 μm layers of nuclear emulsion providing to regu-

late the ionizing threshold of development and to obtain the trace density low enough for counting the individual grains in it is suggested. The method is based on dosed poisoning of emulsion monocrystals by Br/sup -/ ions diffusing to the layer from special emitting layers of the same emulsion glued to its both sides; the emitting layers have been previously exposed to a low depth by the blue-violet light. If the emitters are glued to the detector by exposed surfaces, the emission from them and the diffusion of Br/sup -/ ions during the reduction of AgBr up to Ag in the developed can be well regulated owing both to the value of the light exposure on the emitters and joint development condition of the emitter-detector-emitter glued sandwich. 2 refs.; 7 figs.

16608 **(EFI—813(40)-85) Time and amplitude characteristics of multiwire detectors.** Gavalyan, V.G.; Lorikyan, M.P.; Sarkisyan, Yu.G. (Erevanskij Fizicheskij Inst. (USSR)). 1985. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700690.

A multiwire dielectric detector with separated anode wires is described. The measurement results of its time and amplitude resolution are given. It is shown that the multiwire emission detector does not differ in its characteristics from a multiwire dielectric one. 10 refs.; 2 figs.

16609 **(EFI—819(46)-85) Design principle and structure of the ANI data centre.** Akopov, N.Z.; Arutyunyan, S.Kh.; Chilingaryan, A.A.; Galfayan, S.Kh.; Matevosyan, V.Kh.; Zazyan, M.Z. (Erevanskij Fizicheskij Inst. (USSR)). 1985. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700691.

The design principles and structure of applied statistical programms used for processing the data from the ANI experiments are described. Nonparametric algorithms provide development of high-efficient method for simultaneous analysis of computerized and experimental data, from cosmic ray experiments. Relation data base for unified data storage, protection, renewing and erasuring as well as for fast and convenient information retrieval is considered. 8 refs.

16610 **(FEI—1632) Resolution of spectrometric systems of various types. Problem statement.** Semenov, V.P.; Trykov, L.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1984. 24p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700696.

Results of theoretical investigation into spectrometer resolution of different types of ionizing radiaton are presented. Notions of spectrometric system and its information quality are introduced. The problem of the main types of spectrometric systems is sonsidered. A non-traditional approach to assesement of resolution is formulated, general mathematical formulation of the problem for assesement of resolution is given. 10 refs.; 1 fig.

16611 **(FNAL-TM—1434) Sources for proportional tube gain variation: What to do about it.** Fukui, Y.; Mishina, M.; Hayashide, Y.; Kanda, S.; Kim, S.; Kondo, K.; Masuzawa, M.; Miyashita, S.; Miyata, H.; Mori, S. (Fermi National Accelerator Lab., Batavia, IL (USA); KEK, Oho-machi, Ibaraki-ken (Japan); Tsukuba Univ., Sakura, Ibaraki (Japan); Tokyo Univ., Tanashi (Japan). Inst. for Cosmic Ray Research). Oct 1985. Contract AC02-76CH03000. 25p. (CONF-8510308—3). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005561.

From Gas sampling calorimetry workshop; Batavia, IL, USA (31 Oct 1985).

In the high-energy domain systematic uncertainties become a substantial fraction of attainable energy resolution of a proportional tube electromagnetic calorimeter. Sources of nonuniformity and fluctuation of calorimeter response are discussed and test data on the magnitude of the effects are presented. Possible ways of maintaining these effects under control are discussed and test data are discussed which demonstrated that such effects could in fact be monitored and corrected to less than 1%.

16612 **(GSI—86-16) Development of an universal particle telescope with large dynamics for light and medium heavy fragments.** Wessels, P. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Jun 1986. 70p. (In German). NTIS (US Sales Only), PC A04/MF A01. File Number DE87750513.

In the present work the development of a particle telescope with a large dynamical range is described which consists of a high-pressure parallel-plate counter, an ionization chamber with field-parallel incidence, and a scintillation counter in phoswich construction. Because of its simple mechanical construction it could be easily fabricated and reliably operated. The modul construction of the telescope permitted the easy exchange respectively the changes of single components. The characteristic quantities of the telescope which were determined in laboratory tests and measurements on the beam are presented in the following. The time resolution of the parallel-plate counter amounted to 480 psec. By means of the parallel-plate counter a trigger for complex fragments ($Z \geqq 2$) could be generated the sensitivity threshold of which could be variably regulated above a limit. By the ionization chamber the resolution in the energy loss for α particles (5-6 MeV) could be determined in the laboratory to 5.3%. It could be shown that by different measuring methods nuclei with nuclear charge numbers between $Z=1$ and $Z \approx 35$ could be identified in an energy range from propor to1 MeV/u to 80 MeV/u. The measured resolution $\Delta Z/Z$ amounted to between 2.3% and 6.2% dependently from the nuclear charge. This particle telescope is currently constructed in a series of 30 exemplars. Of these, 24 shall be applied in experiments on the study of the decay of highly excited nuclei at the UNILAC and at the GANIL accelerator.

16613 **(IFVE-OEF—85-40) Cherenkov radiation ring spectrometers with hodoscopic photomultipliers for measurement of particle velocity with momentum up to 300 GeV/c.** Baldin, B.Yu.; Vasil'chenko, V.G.; Volkov, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 14p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700711.

Variants of Cherenkov radiation ring spectrometers with hodoscopic photomultipliers intended for identify π, K, p with momentum up to 300 GeV/c are considered. Basic characteristics of spectrometers and ways of their further development are presented. 9 refs.; 6 figs.; 2 tabs.

16614 **(IFVE-OEF—85-153) Hodoscope photomultipliers and their application in particle detectors.** (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 30p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87701288.

The development of hodoscope photomultipliers and their basic characteristics are described. Their application in particle detectors is described. 54 refs.; 20 figs.; 3 tabs.

16615 **(IFVE-OEF—85-174) Study of light pulse shape from polystyrene scintillators.** Peresypkin, A.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700712.

Submitted to the journal Instrum. Exp. Tech. .

The light pulse shape of plastic scintillators with PPO and POPOP additions was measured by a single photon counting technique. When analyzing the results, much attention was given to the beginning of a scintillation burst (start burning). At present this problem was little studied experimentally, and the papers available contradict the theory. The measurements show that de-excitation kinetics is well described by the Forster theory. 11 refs.; 1 fig.

16616 (IFVE-OEF-ORI—85-36) **Radial distributions of shower energy deposition in hadron and photon hodoscopic sandwich-type calorimeters with cell structure.** Bajshev, I.S.; Mokhov, N.V.; Semenov, V.K. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 16p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700713.

The average energy deposition behaviour for the showers in the cell-structure scintillation hadron and photon calorimeter depending on the distance between the centres of cells and coordinates of the point where a 3 GeV particle initiated the shower has been measured. The experimentally obtained dependences are compared with the Monte-Carlo calculated radial distributions of the shower energy deposition integrated over the total calorimeter depth and over the area occupied by the cell. The values for the radial distribution parametrs are defined by fitting the experimental data with model descriptions, which at the obtained values for the parameters agree quite satisfactorily with Monte-Carlo calculations. Cell performances have been obtained. Axial light collection system with cyllindrical WLS in cells has been used. 28 refs.; 7 figs.

16617 (IFVE-ONF—85-73) **Rectangular drift tube characteristics.** Denisov, D.S.; Musienko, Yu.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700718.

Submitted to the journal Instrum. Exp. Tech. .

Results on the study of the characteristics of a 50 x 100 mm aluminium drift tube are presented. The tube was filled with argon-methane and argon-isobutane mixtures. With 16 per cent methane concentration the largest deviation from a linear relation between the drift time and the drift path over 50 mm is less than 2 mm. The tube filled with argon-isobutane mixture is capable of operating in a limited streamer mode. 9 refs.; 5 figs.

16618 (IFVE-ONF-OEF—85-157) **Using pulse fall of a drift proportional tube for time resolution improvement.** (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 5p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701289.

Submitted to the journal Instrum. Exp. Tech. .

Time characteristics of a proportional drift tube 1.5 m longand 30 mm in diametr filled with argon-methane mixture, have been studied on the beam. By timing to the pulse fall from minimally ionizing particles time resolution of 20 ns (FWHM) has been obtained. 3 refs.; 2 figs.

16619 (INIS-mf—10554) **Spectrometry and in core dosimetry of neutron radiation. Part I. Invited papers.** Marencak, M. (ed.). (Ceskoslovenska Komise pro Atomovou Energii, Prague). 1985. 102p. (In Czech). (CONF-8503268—Pt.1). NTIS (US Sales Only), PC A06/MF A01. File Number DE87700735.

From Workshop on spectrometry and in core dosimetry of neutron radiation; Rez, Czechoslovakia (20 Mar 1985).

The proceedings contain 8 invited papers discussing current problems of spectrometry and in core neutron dosimetry with regard to applications in nuclear power engineering. The papers deal with the following areas: reactor physics and in core dosimetry; calculations of the spatial and energy distribution of neutrons in the reactor core and shielding; proton-recoil neutron spectrometry; determining neutron spectra with activation detectors; assessment of measurement system used in core dosimetry; in core measurement and monitoring of the reactor radiation field; monitoring the radiation damage to reactor structural materials. (J.P.).

16620 (INIS-mf—10554, pp 7-13) **Reactor physics (nuclear power plant design and operation) and in core dosimetry.** Petr, J. (Ceske Vysoke Uceni Technicke, Prague, Czechoslovakia. Fakulta Jaderna a Fysikalne Inzenyrska). 1985. (In Czech). NTIS (US Sales Only), PC A06/MF A01. File Number DE87700735. (CONF-8503268—Pt.1).

From Workshop on spectrometry and in core dosimetry of neutron radiation; Rez, Czechoslovakia (20 Mar 1985).

In core dosimetry is closely linked with the research of radiation damage to structural materials of the nuclear reactor, especially of pressure vessels. In order to fulfil the surveillance programme of WWER reactor pressure vessels, it is necessary to define accurately the spectra of mixed neutron and gamma radiation. For the said reasons it is necessary to set up a workplace which would not only collect nuclear data but would also provide services and build a facility to provide standard neutron spectra. An experimental facility with a neutron field in the ranges of medium and higher energies will have to be built in the sense of definitions recommended by the IAEA. (J.P.).

16621 (INIS-mf—10554, pp 65-78) **Assessment of in core dosimetry measuring systems.** Racek, J. (Ustav Jaderneho Vyzkumu CSKAE, Rez, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A06/MF A01. File Number DE87700735. (CONF-8503268—Pt.1).

From Workshop on spectrometry and in core dosimetry of neutron radiation; Rez, Czechoslovakia (20 Mar 1985).

The general and specific principles are given for the differential spectroscopy of fast neutrons in mixed reactor radiation. Block diagrams are given of a /sup 6/LiF spectrometer, a spectrometer with a proportional hydrogen chamber and a spectrometer with scintillation detectors. The selected properties are given of basic assemblies of spectrometric systems such as the detector-preamplifier, amplifier, ADC, TAC converters, analyzer. (E.S.).

16622 (INIS-mf—10554, pp 37-48) **Proton-recoil neutron spectrometry.** Holman, M. (Skoda, Plzen, Czechoslovakia. Zavod Energeticke Strojirenstvi). 1985. (In Czech). NTIS (US Sales Only), PC A06/MF A01. File Number DE87700735. (CONF-8503268—Pt.1).

From Workshop on spectrometry and in core dosimetry of neutron radiation; Rez, Czechoslovakia (20 Mar 1985).

A brief analysis is made of the method of recoil protons using the combined measurement with a scintillation spectrometer with a 10 mm dia. by 10 mm thick stilbene crystal and a set of spherical proportional chambers filled with hydrogen to a pressure of 392.4; 981; 392.4; 98.1 kPa. Pulse shape discrimination was used for gamma radiation discrimination. Programs in FORTRAN IV identical for all detectors were used for evaluating the spectra. The evalution proceeded from the hardest to the softest components of the spectrum. Prior to the evaluation, energy calibration was made of each of the components. The energy calibration is described of detectors which is related to the adjustment of optimal operating modes of detectors. One source of errors is the anisotropy of the detectors. The spherical hydrogen chambers were tested in the neutron beam and differences were found in absolute values of the spectra measured at neutron impingement angles 0 and $\pi/2$ to the detector anode; the efficiency of the chambers varied roughly by 10 to 20%. The efficiency of the scintillation spectrometer was determined by measuring the neutron spectrum from the fission of /sup 252/Cf, the source-to-detector distance being 1 m. A comparison of the computed and measured spectra showed good agreement in absolute values and in the spectrum shape with an error smaller than 5% in the energy range 1 to 10 MeV. Deviations of actual efficiency from theory were found when the chambers were tested by comparison with the scintillation spectrometer. (J.P.).

16623 (INIS-mf—10554, pp 49-64) **Neutron spectrum determination with activation detectors.** Osmera, J. (Ustav Jaderneho Vyzkumu CSKAE, Rez, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A06/MF A01. File Number DE87700735. (CONF-8503268—Pt.1).

From Workshop on spectrometry and in core dosimetry of neutron radiation; Rez, Czechoslovakia (20 Mar 1985).

The methods are presented of calculating neutron spectra. Programs were written allowing to analyze, measurement in the whole energy range of reactor neutrons. The characteristic properties are given of SPECTRA, CRYSTAL BALL and SAND-II programs. The accuracy is evaluated of results obtained by these programs and the conclusions are summed up of an international comparison known as REAL-80. The selection is discussed of suitable activation detectors and their use for measuring neutron spectra in reactors. Tables show basic data for monitoring the neutron field in

the 57/10 channel of the WWR-S reactor and the evaluation of irradiation experiments on samples of ferritic materials. (E.S.).

From 4. international symposium on neutron induced reactions; Smolenice, Czechoslovakia (17 Jun 1985).

16628 (INIS-mf—10559) **Automated beta spectrometer.** Jursova, L.; Broj, K.; Novakova, O.; Bendl, J.; Javornicky, K.; Vasek, T. (Tesla, Premysleni (Czechoslovakia). Vyzkumny Ustav Pristroju Jaderne Techniky). Nov 1985. 96p. (In Czech). NTIS (US Sales Only), PC A05/MF A01. File Number DE87700740.

The first Czechoslovak liquid scintillation spectrometer was designed for the detection of radionuclides emitting low energy particles. Its high detection efficiency is due to 4π geometry and the low energy threshold of the evaluation equipment. The feasibiity is claimed of attaining the required parameters using only components manufactured in Czechoslovakia. It is assumed that for /sup 3/H a total detection efficiency of 40 to 45% will be achieved (world standard 60%) because commercial photomultipliers do not allow better performance. In a later stage the shape of the detection chamber will be optimized, lightproof closure designed, shielding of the radioisotope in non-operating position devised, etc. (J.C.).

16629 (JINR—13-85-754) **Double-arm time-of-flight spectrometer for the DEMAS installation.** Will, E.; Sodan, H.; Luk'yanov, S.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1985. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700768.

A double-arm time-of-flight spectrometer for the DEhMAS installation intended to registrate and study the characteristics of fragment-like products produced in heavy-ion reactions with complex nuclei is described. The base of the spectrometer are two identical mobile position sensitive time-of-flight arms. Each arm consists of a transmission detector on the base of microchannel electron multiplier and a plane-parallel avalance counter, which permit to determine the velocity, and of a position sensitive ionization chamber which measures the energy, X and Y coordinates of detected particle. Time-of-flight coordinate measurements permit to identify detected products by mass, energy, space distribution at mass resolution being M=+-1.5 a.e.m. The principle of correlation measurements is also described basing on which one can separate products belonging to a definite reaction channel. 14 refs.; 9 figs.; 1 tab.

16630 (JINR—13-85-810) **TV event recorder.** Butenko, V.A.; Vyskochil, S.; Drozdov, V.A.; Zav'yalov, V.F.; Men'shikov, A.L.; Kissling, H.; Prikhod'ko, V.I.; Maly, M.; Miksh, A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1985. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700770.

A TV event recorder intended for data monitoring from spark and streamer chambers is described. It contains a camera tube, videoprocessor, scanning control unit, digitizer, synchronizer, TV-image memory device, autonomous calibration system and TV-monitor. The event images in a track detector are trasferred to a TV-monitor for visual observation and their digitized images are conveyed via CAMAC-interface to the computer for recording on magnetic tape and further processing. The TV system described may be used in any experiment requiring observation and detection of single shot high-speed shuttered pictures. 6 refs.; 4 figs.

16631 (JINR—13-85-817) **Analog-to-digital converter.** Dinh Sy Hien; Nguen Ngoc Lam; Kalinin, A.I.; Nguen Suan Hong. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1985. 3p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700771.

Analog-to-digital converter (ADC) with 4096 channel number for applications in nuclear spectroscopy systems is described. It is capable to measure pulse and slowly variable or constant voltage. The ADC contains a Wilkinson type analog-to-time converter for an oscillator of 200 MHz clock rate, a twelve bit address scaler and has the following technical specifications: input signal polarity-positive; input signal amplitude - from 0.05 V to 5 V; differential nonlinearity is +-2%; integral nonlinearity is not over 0.1%; temperature instability - 0.2 channel/deg C on the level of 4096 channels. ADC is made in a unit width module in CAMAC standard. 3 refs.; 1 fig.

16632 (JINR—13-86-13) **Time planar HPGe detectors.** Abrosimov, V.N.; Morozov, V.A.; Osipenko, B.P.; Prazhak, F.; Stegajlov, V.I.; Yurkovskij, Ya. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1986. 9p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700774.

The time resolution of the planar HPGe detectors was investigated with small value of the dead layer of (p, n) transition. The time resolution is 2tau/sub 0/=0.95 ns for Esub(γ)1332 keV in coincidence with β/sup -/-particles of /sup 60/Co. 4 refs.; 9 figs.; 2 tabs.

16633 (JINR—D-13-85-653) **Readout method for wire chambers.** (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1985. 4p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701328.

Submitted to the journal Nucl. Instrum. Methods.

The method for readout of information from wire chambers through a transparant wire cathode is investigated in order to sdudy the possibilities of its practical usage. To observe the shape and amplitude of the signal induced on an external readout electrode depends on the detector geometry and makes approximately 10% percent of the anode signal values. The application of this method should permit one to distinguish a detector in active device

and independent readout system more fleaxible and to improve detector coordinate properties. 2 refs.; 1 fig.

16634 **(JINR—E-16-85-814) Influence of different detector parameters on the neutron sensitivity of OSL-detectors.** Fellinger, J.; Huebner, K.; Schmidt, P.; Henniger, J. (Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of Radiation Safety). 1985. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700786.

On the base of a method for the calculation of the neutron sensitivity of OSL detectors with a high contents of hydrogen a systematic investigation of the influence of different detector parameters on the neutron sensitivity was carried out. The detector thickness, the thickness of the contact radiator, the luminophor contents and the grain size of the used luminophor influence the neutron sensitivity, first of all in the energy range of fast neutrons. Especially the use of small grain luminophor considerably increases the sensitivity whereas the other parameters have a small influence on the neutron sensitivity. The neutron sensitivities calculated and experimentally determined at variation of the detector parameters are in good agreement. 17 refs.; 5 figs.; 3 tabs.

16635 **(JINR—R-13-85-819) Investigation of spatial resolution of plastic streamer tubes.** (Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of New Acceleration Methods). 1985. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701340.

Submitted to the journal Instrum. Exp. Tech. .

A possibility of use detectors on the base of plastic streamer tubes for precise particle coordinate determination is tested. The method, based on determination of charge centroid, which is induced by external electrodes, provides the space resolution deltasub(x)=530 μm, and resolution of the method based on drift time measurement is 110 μm < deltasub(x) < 350 μm. The electron drift velocity measured in the argon-isobutane gas mixture with a high isobutane concentration (1Ar:3C/sub 4/H/sub 10/) was (41.8 +- 4.3) x 10/sup 5/ cm/s. Coordinate accuracy obtained in both cases is better than that required to muon spectrometers with magnetized iron. It permits to use plastic streamer tubes for particle trajectory determination in such installations. 15 refs.; 12 figs.

16636 **(JINR-R—6-85-753) On relative detection efficiency of a channel electron multiplier for electrostatic beta spectrometer.** Inoyatov, A.Kh.; Briancon, Ch.; Vallen, R.; Legrand, B.; Burin, K.; Vulov, Ts.; Minkova, A.; Pokrovskij, V.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1985. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700805.

The relative detection efficiency of the Bendix CEM 4503 type channel electron multiplier (CEM) which serves as an electron detector in an electrostatic beta spectrometer is studied in the 60-1000 eV energy range. A decreasing of the quantity studied by a factor 3 is observed at low electron energies. To increase the CEM efficiency resulting in increasing the total spectrometer efficiency the acceleration of detected electrons is applied. Optimum operation conditions of the CEM permiting to increase the signal-to-background ratio by a factor 2 without any visible change of the resolution and the response function of the spectrometer have been determined as well. 9 refs.; 13 figs.

16637 **(JINR-R—10-85-744) Dialogue scanning measuring systems.** Borodyuk, V.P.; Shkundenkov, V.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1985. 19p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700807.

Submitted to the collection Avtomatizatsiya nauchnykh issledovanij.

The main developments of scanning measuring systems intended for mass precision processing of films in nuclear physics problems and in related fields are reviewed. A special attention is paid to the problem of creation of dialogue systems which permit to simplify the development of control computer software. 54 refs.

16638 **(JINR-R—10-85-783) Realization of one algorithm for track elements isolation in analyzing the images of nuclear interactions.** Astakhov, A.Ya. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1985. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700809.

The algorithm for isolation of track elements, based on the analysis of geometrical characteristics of dashed images is described. For the analysis, the pattern under investigation is expanded into elementary cells in terms of strings and columns. The peculiarities of scheme-technical solutions of electronic equipment for the track and noise filtering on one string and on the successive strings are listed. 3 refs.; 4 figs.

16639 **(JINR-R—13-85-752) Measuring module of an apparatus for polarization analysis of ultracold neutrons on the base of microcomputer.** Elizarov, O.I.; Zhukov, G.P.; Zamrij, V.N.; Roganov, A.B.; Sever'yanov, V.M.; Taran, Yu.V.; Shirokov, V.K.; Shchelev, A.S. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1985. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700814.

An apparatus with neutron storage and a measuring module based on a set of CAMAC blocks and a microcomputer have been installed on the ultracold neutron (UCN) channel of the IBR-2 pulsed reactor for studying the polarization characteristics of ferromagnetic films. The measuring module provides for the time analysis of pulses from the UCN detector, spectrometric data equisition, measuring cycle timing, overall system control and monitoring of up to 32 its parameters. As a part of soft ware a special language has been developed consisting of a set of interpreting commands. The measuring module and its software enables one to change easily the modes and operation cycle of the apparatus, provides for a wide range experimental program and for carrying out protracted measurements in an automatic mode. 11 refs.; 2 figs.

16640 **(JINR-R—15-85-786) Electrostatic separator of total fusion reaction products in the heavy ion beam of Vasilisa installation.** Eremin, A.V.; Tarabrin, V.A.; Stepantsov, S.V.; Obukhov, Yu.L.; Ter-Akopyan, G.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1985. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700815.

An electrostatic separator under construction at the Joint Institute for Nuclear Research, using three stages of separation of primary beam ions and of scattered ions has been described. The setup has evaporation recoil focusing system and will be used for separation of reaction products generated by heavy ions with a mass from 20 to 60 a.m.u. with target nuclei of masses greater than 100 a.m.u. It is shown that the separator allows to select recoil atoms emitted from a target under +-3 deg angle with relative energy width of +-10% and within the relative charge range of +-5%. It is experimentally tested that after one stage of electrostatic separation the decontamination factor for recoil atoms from beam ions is 10/sup 5/. 21 refs.; 3 figs.; 1 tab.

16641 **(JINR-R—16-85-802) Energy dependence of some neutron dosimeter sensitivities in the 1 eV up to 4 keV energy range.** Buchnev, V.N.; Komochkov, M.M.; Mokrov, Yu.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of Radiation Safety). 1985. 9p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700816.

The sensitivities of DN-A-1 device and SNM-14 slow neutron counter with a combined moderator in the 1 eV up to 4 keV energy range has been experimentally determined. The IBR-30 reactor served as a neutron source, spectral distribution was performed by the time-of-flight method. The sensitivity constancy of a long counter in the 1 eV up to 4 keV energy range has been experimentally shown. The obtained sensitivity values and other data available could be used in determining energy dependencies of the device sensitivity in essential neutron energy range. It permits to evaluate their errors when using as dosimeters in radiation fields of nuclear physics installations. 6 refs.; 9 figs.

16642 (KIYI—85-13) Automation correlation installation on-line with a computer. Vishnevskij, V.A.; Tkachuk, I.P.; Dej, Yu.A.; Lashko, T.N.; Patlan', Yu.V.; Sidorenko, V.A.; Trishin, V.V.; Chaplitskaya, T.V. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 31p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700828.

On the base of the SM-4 computer and CAMAC equipment the automatic three-dimensional spectrometer was made in order to carry out the correlation experiment at the U-240 cyclotron at the Institute for Nuclear Research, The Ukrainian Academy of Science. A block-diagram of correlation installation, units of automatic equipment and software implemented for automatic installation procedure were described. A package of SPECTR programmes for interpretation of linear γ-spectra and $\gamma\gamma$-coincidence spectra was established. Reslts of check experiments were cited. 7 refs.; 7 figs.

16643 (KIYI—85-27) Radioactive contaminations of materials for low-background setups. Bondarenko, O.A.; Gar'kusha, G.N.; Danevich, F.A. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 40p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700835.

The methods and results of studying of the radioactive contaminations in different materials are described. The measurements were made by means of various scintillation and semiconductor Ge(Li) detectors in 1982-1985. The materials have been indicated not advisable to use in low-background setups. Various detector sensitivities are discussed at measurements of low activities. 15 refs.; 22 figs.; 6 tabs.

16644 (KIYI—85-28) Investigation of backgrounds of scintillation and semiconductor detectors in the underground lowbackground laboratory of the Institute for Nuclear Research, the Ukrainian Academy of Sciences. Zdesenko, Yu.G.; Kropivyanskij, B.N.; Kuts, V.N.; Nikolajko, A.S.; Bondarenko, O.A.; Kostezh, A.B. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 29p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700836.

The underground lowbackground laboratory of the Institute for Nuclear Research, the Ukrainian Academy of Sciences is situated in a salt mine of Solotvina (Zakarpatskaya region) at the depth of 1000 meters of water equivalent. The background conditions at the laboratory were measured by the lowbackground semiconductor and scintillator detectors. The use of additional lead, polyethylene and mercury shielding allowed to reduce the background of Ge(Zi) detector in 100 times approximately as compared to the analogous measurements at the earth's surface. 7 refs.; 13 figs.; 5 tabs.

16645 (KIYI—85-36) Electric field distribution and impurity concentration in coaxial high purity HP-Ge- and Ge(Li)-detectors with one-open face. Kirnas, I.G.; Litovchenko, P.G.; Petrosyan, Eh.E.; Pashchuk, N.N. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 28p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700840.

In paper based on a model of coaxial detetor with one-open face (spherical coaxial detector - SC - detector) E(r)-dependenceis shown experimentally to be stronger than in coaxial detectors with two open faces (right coaxial detector - RC - detector). The analytical expression for E(r) determination is obtained for cases, where (Nsub(a)-Nsub(d))=0 and (Nsub(a)-Nsub(d)) not equal 0=const. The expressions are obtained allowing to determine (Nsub(a)-Nsub(d))=f(r) and E(r) from voltage-capacitance characteristics in face part of SC-detectors, where (Nsub(a)-Nsub(d)) value is changed arbitrarily by detector volume (e.g. in Ge-(Li)-detectors). 10 refs.; 9 figs.

16646 (KURRI-TR—266) Proceedings of the specialist research meeting on measurements of short-lived isotopes. Yoshizawa, Yasukazu; Okano, Kotoyuki; Kawase, Yoichi (eds.). (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.). Apr 1985. 67p. (In Japanese). (CONF-8501103—Summs.). NTIS (US Sales Only), PC A04/MF A01. File Number DE87701222.

From Specialist research meeting on measurements of short-lived isotopes; Kyoto, Japan (9 Jan 1985).

In order to discuss various problems associated with experimental techniques for the study of short-lived nuclei produced by a research reactor or an accelerator, and to exchange informations on the important progress in this field, the specialist research meeting on the measurements of short-lived isotopes was held in this institute (KURRI), 9-10, January, 1985. Recent developments on ISOL systems and on other measuring instruments made at several universities and research institutes in Japan were reported, together with recent informations on ISOL systems in other countries. These are summarized in written form and are presented here.

16647 (LA—10815-MS) Field test and calibration of neutron coincidence counters for high-mass plutonium samples. Menlove, H.O.; Dickinson, R.J.; Douglas, I.; Orr, C.; Rogers, F.J.G.; Wells, G.; Schenkel, R.; Smith, G.; Fattgh, A.; Ramalho, A. (Los Alamos National Lab., NM (USA)). Feb 1987. Contract W-7405-ENG-36. 47p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004769.

Five different neutron coincidence systems were evaluated and calibrated for high-mass PuO_2 samples. The samples were from 2 to 7.2 kg of PuO_2 in mass, with a large range of burnup. This report compares the equipment and the results, with an evaluation of deadtime and multiplication corrections.

16648 (LA-UR—86-4387) The Low-Q Diffractometer at the Los Alamos Neutron Scattering Center. Seeger, P.A.; Williams, A.; Trewhella, J. (Los Alamos National Lab., NM (USA)). 1986. Contract W-7405-ENG-36. 12p. (CONF-8609234—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003763.

From International collaboration on advanced neutron sources ↑; 0.

Instrument criteria are presented for the Low-Q Diffractometer (LQD) at the Los Alamos Neutron Scattering Center (LANSCE), and a design is shown to meet these criteria. The collimator consists of multiple-aperture pinhole plates, and incorporates "dynamic gravity focusing" to center all wavelengths on the detector. Preliminary test results, making use of the Proton Storage Ring, a liquid hydrogen moderator, and two different position-sensitive detectors are shown.

16649 (PTB-Dos—14) New dose quantities for personnel dosemeters. Results of the intercomparison program 1985 - seminar report. Boehm, J.; Piesch, E.; Regulla, D. (eds.). (Fachverband fuer Strahlenschutz e.V., Karlsruhe (Germany, F.R.). Arbeitskreis Dosismessung Externer Strahlung; Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Gruppe Strahlenschutzmetrologie). Jun 1986. 327p. (In German). (CONF-8511235—; FS—86-38-AKD). NTIS (US Sales Only), PC A15/MF A01. File Number DE87750519.

From Seminar on new dose quantities for personnel dosemeters - results of the intercomparison program 1985; Braunschweig, F.R. Germany (26 Nov 1985).

In 1985, the Workshop External Dosimetry (AKD) of the German-Swiss 'Fachverband fuer Strahlenschutz' and the Physikalisch-Technische Bundesanstalt (PTB) organized an intercomparison experiment in order to find out whether commonly used personal dosemeters are able to indicate the new ICRU dose quantities (ICRU 39) H/sub s/ (0,07) and H/sub p/(10) recommended for personal dosimetry. A total number of 30 representative dosimetry systems participated at the interlaboratory test. These systems make use mainly of L and RPL dosemeters, but also film dosemeters and direct reading dosemeters have been chosen. The irradiations have been performed over the energy range 25-662 keV using irradiations free in air as well as on the ICRU sphere phantom. Under an angle of 0/sup 0/, 45/sup 0/ and on the rotating phantom. The

effect of phantom type has been investigated using the ICRU sphere and the Alderson human phantom. With respect to the ICRU quantities, three categories of personal dosemeters have been found dosemeter systems which simultaneously indicate the exposure X as well as H'(0,07) and H'(10) without any change of the evaluation technique or energy compensation filter, dosemeter systems which must be improved either in the evaluation procedure or by using additional detector readings, and dosemeter systems which must be changed in the energy compensation filters. In different papers the participants discuss their own results. Additional contributions of the seminar are presented, which discuss general subjects of introducing new dose quantities and other concepts of calibration quantities for external dosimetry.

16650 **Using a cyclotron plus ECR source for detector evaluation and calibration.** McMahan, M.A.; Wozniak, G.J.; Lyneis, C.M.; Bowman, D.R.; Charity, R.J.; Liu, Z.H.; Moretto, L.G.; Kehoe, W.L.; Mignerey, A.C.; Namboodiri, M.N. (Lawrence Berkeley Lab., CA, USA. Nuclear Science Div.; Maryland Univ., College Park, USA. Dept. of Chemistry; Lawrence Livermore National Lab., CA, USA. Nuclear Chemistry Div.). *Nuclear Instruments and Methods in Physics Research;* 253: No. 1, 1-9(15 Dec 1986). Contract AC03-76SF00098.

A technique is described to quickly measure the response of detectors to intermediate-energy heavy ions. An ECR source was utilized to produce ions as heavy as krypton. A series of ions with the same charge-to-mass ratio was accelerated in a cyclotron to a constant velocity or energy/nucleon. Different ion species were extracted by adjusting the resonant frequency a few kHz. Detectors were directly exposed to the extracted beams. For a charge-to-mass ratio of one-quarter, over seventeen ion species from /sup 4/He/sup +1/ to /sup 84/Kr/sup +21/ were observed in a two hour period.

16651 **High-rate CAMAC aquisition system.** Belshe, R.A.; Lee, M.K. (Lawrence Berkeley Lab., CA, USA). *Nuclear Instruments and Methods in Physics Research;* 253: No. 1, 65-72(15 Dec 1986). Contract AC03-76SF00098.

The High Energy Resolution Ball (HERB) consists of 21 bismuth-germanate shielded germanium detectors, clustered in three rings. In the center of the cluster is a 40 element bismuth-germanate ball which functions as a sum spectrometer and a multiplicity filter. The purpose of the system is to measure the energy, multiplicity, and correlations of gamma rays emitted from a target located in the center of the ball. This paper describes the data acquisition hardware and software which was developed to support this apparatus. The high data rates generated are handled by two levels of FIFO buffering in CAMAC hardware. Also of interest is the method of calibrating the individual analog input channels. The software obtains calibration information from the incoming experimental data and sets up a special CAMAC module which dynamically adjusts the gain and offset of each input channel.

16652 **X-ray position detection in the region of 6 μm RMS with wire proportional chambers.** Fischer, J.; Radeka, V.; Smith, G.C. (Brookhaven National Lab., Upton, NY, USA). *Nuclear Instruments and Methods in Physics Research;* 252: No. 2/3, 239-245(1 Dec 1986). (CONF-860272—). Contract AC02-76CH00016.

From Wire chamber conference; Vienna, Austria (25 Feb 1986).

We have developed a MWPC system for X-ray detection with a position resolution in the region of 6 μm rms (14 μm fwhm). The performance with argon, krypton or xenon at pressures from 1 to 10 atm is explored for the X-ray energy range 5-25 keV. At a resolution of 6 μm rms the effects of photoelectron and Auger electron range, electronic noise, avalanche spread, lateral electron diffusion, as well as X-ray beam collimation, become of comparable magnitude. Their limiting effects on avalanche centroid fluctuation, and hence on position resolution, are investigated. The position resolution achieved in this work compares favorably with that of solid state devices.

16653 **New drift chamber for the Mark II detector at the SLAC linear collider.** Hanson, G.G. (Stanford Linear Accelerator Center, CA, USA). *Nuclear Instruments and Methods in Physics Research;* 252: No. 2/3, 343-349(1 Dec 1986). (CONF-860272—). Contract AC03-76SF00515.

From Wire chamber conference; Vienna, Austria (25 Feb 1986).

A new central drift chamber has been constructed for the Mark II detector for use at the new SLAC Linear Collider. The design of the new chamber is based on a multi-sense-wire cell of the jet-chamber type. In addition to drifttime measurements, pulse-height measurements from the sense wires provide electron-hadron separation by dE/dchi. The chamber has been installed in the detector and is being tested at PEP before being moved to the SLC. The design and construction of the chamber, as well as initial performance results from the PEP data, are presented.

16654 **Development of high pressure proportional counters.** Oddone, P.; Smith, G.; Green, A.; Nemethy, P.; Baksay, L.; Schick, L.; Heflin, E.G. (Lawrence Berkeley Lab., CA, USA; New York Univ., NY, USA; Union Coll., Schenectady, NY, USA; Dallas Univ., Irving, TX, USA). *Nuclear Instruments and Methods in Physics Research;* 252: No. 2/3, 458-460(1 Dec 1986). (CONF-860272—).

From Wire chamber conference; Vienna, Austria (25 Feb 1986).

We have begun to investigate the possibility of operating gas counters at high pressures. In a first step we were able to operate cylindrical chambers up to 430 atm with a gas gain of about 300 using a mixture of 92% Ar and 8% CH/sub 4/.

16655 **Detection of charged particles in amorphous silicon layers.** Perez-Mendez, V.; Morel, J.; Kaplan, S.N.; Street, R.A. (Lawrence Berkeley Lab., CA, USA; Xerox Palo Alto Research Center, CA, USA). *Nuclear Instruments and Methods in Physics Research;* 252: No. 2/3, 478-482(1 Dec 1986). (CONF-860272—). Contract AC03-76SF00098.

From Wire chamber conference; Vienna, Austria (25 Feb 1986).

Also published as report LBL--20664; CONF-860272--7; CONF-8603109--2.

The successful developemnt of radition detectors made from amorphous silicon could offer the possibility for relatively easy construction of large area position-sensitive detectors. We have conducted a series of measurements with prototype detectors, on signals derived from alpha particles. The measurement results are compared with simple model calculations, and projections are made of potential applications in high-energy and nuclear physics.

16656 **Review of wire chamber aging.** Va'vra, J. (Stanford Linear Accelerator Center, CA, USA). *Nuclear Instruments and Methods in Physics Research;* 252: No. 2/3, 547-563(1 Dec 1986). (CONF-860272—). Contract AC03-76SF00515.

From Wire chamber conference; Vienna, Austria (25 Feb 1986).

Also published as report SLAC-PUB--3882; CONF-860162--2.

This paper makes an overview of the wire chamber aging problems as a function of various chamber design parameters. It emphasizes the chemistry point of view and many examples are drawn from the plasma chemistry field as a guidance for a possible effort in the wire chamber field. The paper emphasizes the necessity of tuning of variables, the importance of purity of the wire chamber environment as well as it provides a practical list of presently known recommendations. In addition, several models of the wire chamber aging are qualitatively discussed. The paper is based on a summary talk given at the Wire Chamber Aging Workshop held at LBL, Berkeley on January 16-17, 1986. Presented also at Wire Chamber Conference, Vienna, February 25-28, 1986.

16657 Drift-pots for small angle elastic scattering at the Fermilab collider. Amos, N.; DeSalvo, R.; Orear, J.; York, T.; Baker, W.; Eartly, D.; Lennox, A.; Pruss, S.; Bertani, M.; Giacomelli, G. (Cornell Univ., Ithaca, NY, USA; Fermi National Accelerator Lab., Batavia, IL, USA). *Nuclear Instruments and Methods in Physics Research;* **252**: No. 2/3, 263-266(1 Dec 1986). (CONF-860272—).

From Wire chamber conference; Vienna, Austria (25 Feb 1986).

In order to measure the small angle p-anti p scattering at the Fermilab Tevatroncollider we developed very small drift chambers integrated with thin-wall roman pots. We named them drift-pots. The drift-pots are active 100 μm from the vacuum of the beam with an expected resolution of 60 μm in the drift direction and 250 μm in charge division. They are radiation resistant detectors intrinsically insensitive to the beam pickup pulses and their multiple hit readout capability will allow us to push them into the beam halo where p-anti p Coulomb elastic scattering dominates. For our application, we believe the drift-pots, are superior to state of the art silicon detectors.

16658 Performance of the SLD central drift chamber prototype. Atwood, W.B.; Chadwick, G.; Hansl-Kozanecka, T.; Nielsen, B.S.; Prescott, C.Y.; Rochester, L.S.; Young, C.C.; Carr, J.; Nauenberg, U.; Csorna, S. (Stanford Linear Accelerator Center, CA, USA; Colorado Univ., Boulder, USA. Dept. of Physics and Astrophysics). *Nuclear Instruments and Methods in Physics Research;* **252**: No. 2/3, 295-298(1 Dec 1986). (CONF-860272—). Contract AC03-76SF00515.

From Wire chamber conference; Vienna, Austria (25 Feb 1986).

Also published as report SLAC-PUB--3910; CONF-860272--6.

A two-cell prototype of the SLD central drift chamber has been tested using CO/sub 2/-isobutane (92%-8%) at 1 atm. Average single wire resolution of 55 μm was achieved. Charge division tests indicate a resolution of the final design of < or approx. 0.5% of wire length. dE/dchi separation of π/e should be useful up to at least 7 GeV/c. 100 MHz waveform digitizers were used in parallel with conventional timing and integration techniques. The results show equivalent performance for single tracks and a two pulse resolution better than 1 mm.

16659 Prototype results of a high resolution vertex drift chamber for the Mark II SLC upgrade detector. Alexander, J.; Hayes, K.; Hoard, C.; Hutchinson, D.; Jaros, J.; Odaka, S.; Ong, R.; Drell, P.; Fuzesy, R.; Harr, R. (Stanford Linear Accelerator Center, CA, USA). *Nuclear Instruments and Methods in Physics Research;* **252**: No. 2/3, 350-356(1 Dec 1986). (CONF-860272—).

From Wire chamber conference; Vienna, Austria (25 Feb 1986).

Also published as report SLAC-PUB--3889; CONF-860272--2; LBL--21158.

Test results from a full-length prototype of the drift chamber vertex detector for the Mark II SLC Upgrade detector are presented. The 22 cell jet chamber employs planes of grid wires above and below the sense wire plane to increase the electrostatic stability of the sense wires and to narrow the electron arrival time distribution. Two different grid designs have been investigated. The spatial resolution and pulse widths have been measured at a variety of operating points and for different timing schemes in a mixture of 92% CO/sub 2/ and 8% isobutane. Typical results at 3 atmospheres pressure give an average resolution over a 2 cm drift distance of 30 μm for both designs. Efficient double track detection is achieved for tracks separated by 500 μm for one design and by 1000 μm for the other.

16660 Performance of a novel silicon detector. Beuttenmuller, R.; Kraner, H.W.; Ludlam, T.W.; Polychronakos, V.A.; Radeka, V.; Chesi, E.; Fabjan, C.W.; Piuz, F.; Russ, J.S.; Tschulik, A. (Brookhaven National Lab., Upton, NY, USA; European Organization for Nuclear Research, Geneva, Switzerland). *Nuclear Instruments and Methods in Physics Research;* **252**: No. 2/3, 471-477(1 Dec 1986). (CONF-860272—).

From Wire chamber conference; Vienna, Austria (25 Feb 1986).

The performance of a silicon detector with two-dimensional pad readout, intended to be used in the trigger of experiment HELIOS (NA34), has been investigated in a proton/pion beam of 200 GeV/c momentum at the CERN SPS. The data can be described by the convolution of the Landau distribution with a Gaussian, taking into account long distance collisions and electronics noise. Uniformity in peak loss was found to be better than 7%. The response for single tracks through the detector is characterized by the total number of pads with a threshold value (multiplicity), and the number of adjacent pads, responding to a single particle (cluster size). Data on multiplicity and cluster size as a function of threshold will be discussed. Detection efficiency for particles has been measured over the pad area and across the pad boundaries.

16661 Development and testing of a Monte Carlo code system for analysis of ionization chamber responses. Johnson, J.O.; Gabriel, T.A. (Univ. of Tennessee, Knoxville). *Transactions of the American Nuclear Society;* **53**: 408-409(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In the field of radiation dosimetry, it is often necessary to establish an accurate correlation between incident radiation and an observed response to derive such quantities as radiation exposure, energy transfer, or absorbed dose. The correlation depends on the characteristics of the radiation, the irradiated material, and the detection device. Ideally, the detector does not perturb the interactions between the radiation and the material, and translates the interactions into an observable response in a known and reproducible manner. In practice, the detector does perturb the interactions and this perturbation must be quantified as part of the detector's response. To predict these perturbations, a differential Monte Carlo computer code system entitled MICAP - a Monte Carlo Ionization Chamber Analysis Package - was developed and tested at Oak Ridge National Laboratory. This code system determines the neutron, photon, and total response of an ionization chamber to mixed-field radiation environments. Because of the statistical nature of the physical processes involved in detecting radiation using ionization chambers, the stochastic Monte Carlo method is expected to model dosimetry experiments accurately and eliminate limitations inherent in approximate methods.

16662 Two-source method for determining radiation counting dead time. Wehring, B.W.; Mani, K.V. (North Carolina State Univ., Raleigh). *Transactions of the American Nuclear Society;* **53**: 59-60(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper examines two approximations used for the two-source method of dead-time determination in radiation counting experiments. One or the other of these two approximations is given in most textbooks that deal with radiation detection. It is shown here that the less-often-quoted approximation is more accurate than the more quoted one. An interpretation for the poorer of the two approximations, however, is also given, which indicates that it may be useful.

16663 Status of in-plant neutron coincidence counting. Ensslin, N.; Krick, M.; Menlove, H.; Stewart, J. (Los Alamos National Lab., NM). *Transactions of the American Nuclear Society;* **53**: 147-148(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Neutron coincidence counters are used in nuclear material processing plants to assay bulk quantities of plutonium or uranium. Passive assays of plutonium are often made with the High-Level Neutron Counter (HLNC or HLNC-II), the Dual-Range Coincidence Counter, or customized detector geometries. Active assays of uranium are often made with the Active Well Coincidence Counter or the Uranium Neutron Coincidence Collar. Modern counters may have flattened efficiency profiles, fast AMPTEK amplifier/discriminators mounted directly next to the ^{3}He detection tubes, external background shields, or special sample-loading mechanisms. Typical counting times and accuracies that can be obtained for plutonium

are summarized. If isotopic composition is known, large plutonium samples can be assayed in 100 to 200 s - comparable to the time requires to input sample data into the counter's calculator or computer.

16664 **Calibration of neutron correlation counters by calorimetry and gamma-ray measurements.** Rakel, D.A. (Monsanto Research Corp., Miamisburg, OH). *Transactions of the American Nuclear Society;* **53**: 148-149(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The use of transportable calorimeters and gamma-ray isotopics systems for in-field assay of plutonium for safeguard purposes is well established. The authors have coupled the use of calorimetric assay with neutron correlation counting. The combination has been used in five in-field measurement exercises on a variety of sample types. The results of the measurements are presented, and different approaches to the analysis and interpretation of the data are discussed. With the increase in the number of gamma-ray measurements required to support calorimetry and neutron counting, an improvement in the gamma-ray through-put was required. The in-field gamma-ray assay system was modified to accommodate commercially available high count rate (~50-kHz) acquisition of gamma-ray spectral data. The use of this equipment and its impact on calorimetric assay are also presented.

16665 **Hybrid Monte Carlo/analytical model of neutron coincidence counting.** Stewart, J.E. (Los Alamos National Lab., NM). *Transactions of the American Nuclear Society;* **53**: 149-151(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Design of neutron coincidence counters and interpretation of nondestructive nuclear material measurements made with them have been guided by neutron transport calculations. An analog Monte Carlo model in which neutron counts were processed by a simulated shift-register circuit was used to analyze a dual-ring thermal-neutron coincidence counter. This approach resulted in a modified version of the Los Alamos MCNP code. A simpler method (also based on MCNP) was used to calculate coincidence self-multiplication correction factors for passive assay of PuO_2 samples. The latter approach assumed a known detector response function that depended on the multiplicity distribution of neutrons escaping the sample. The simple or correction factor model was also adopted for calculations of active assay measurements of uranium-bearing samples.

16666 **Measuring the third factorial moment; application to neutron correlation assay.** Zucker, M.S. (Brookhaven National Lab., Upton, NY). *Transactions of the American Nuclear Society;* **53**: 151-152(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Several electronic schemes have been devised to accomplish the assay of nuclear material using neutron pulse train correlation analyses. The ones that have emerged as the most successful and widely accepted are those evolved along the lines of the so-called Boehnel circuit. The operation of the Boehnel circuit in its present generic form is illustrated. The presence of three physically independent parameters [(f,n), (α,n), and multiplication] thus requires a corresponding knowledge of three independent parameters of the P/sub v/ distribution of the sample. This information could be furnished by the third factorial moment $\langle v(v-1)(v-2)\rangle$, as has been widely recognized. Several methods of obtaining this from a pulse train have been proposed; the present paper shows how an extension of the Boehnel circuit will yield this quantity.

16667 **Accidental-coincidence corrections.** DeVolpi, A. (Argonne National Lab., IL). *Transactions of the American Nuclear Society;* **53**: 152-153(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

In neutron coincidence counting, as in all other time-coincidence counting, corrections must usually be made for accidental (chance) coincidences, which are a function of instrument parameters, such as count rates, dead time, resolving time, and correlations. A study of three effects has confirmed that the traditional corrections were significantly in error, and a relatively simple and logical exact correlation has been deduced. Because neutron coincidence counting has been important in such applications as nuclear safeguards, time-of-flight measurements of neutron spectra (by delayed coincidences), and measurements of the absolute yield of neutrons from ^{252}Cf, the implications of this discrepancy are widespread.

16668 **Rejection of outliers in thermal neutron coincidence counting.** Goldman, A.S.; Krick, M.S. (Los Alamos National Lab., NM). *Transactions of the American Nuclear Society;* **53**: 153-154(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

The collection and analysis of data thermal neutron coincidence counters (TNCCs) with small computers for nuclear safeguards measurements are increasingly common, particularly for field applications in the International Atomic Energy Agency. In general, these data have not been statistically tested for outliers (observations that stand apart from the bulk of the data). The goal of this work is to provide statistically sound techniques for detecting outliers in TNCC data that can functions automatically in portable computers such as the IBM-PC-compatible computers.

16669 **Advances in the use of ^3He in gas scintillation counters.** Behrens, J.W.; Hongchang, M.; Wasson, O.A. (National Bureau of Standards, Washington, DC). *Transactions of the American Nuclear Society;* **53**: 163(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

For several decades it has been suggested that the $^3He(n,p)T$ reaction should be utilized for detecting neutrons over the entire range from thermal to MeV energies. In fact, this reaction has been suggested as a possible standard. The reaction has a Q value of 764 keV and is easily detected in both a gas proportional counter (GPC) and gas scintillation counter (GSC). The use of ^3He in GPC's is rather common today; however, its use in GSC's is rare, in spite of the improved timing resolution available from the latter. A possible reason for this is the sensitivity of the ultraviolet (uv) photons to trace organic impurities in the gas. At the National Bureau of Standards (NBS), the authors constructed a $^3He/Xe$ GSC which operated for over two years on its original high-purity gas fill without any continuous gas purification. This step marks a significant advance toward the possible standardization of the $^3He(n,p)T$ reaction.

16670 **(CEA-CONF—8461) Utilisation of image intensifiers used in conjunction with streak cameras.** Cavailler, C. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). May 1986. 35p. (In French). (CONF-8605110—4). NTIS (US Sales Only), PC A03/MF A01. File Number DE87750445.

From OPTO '86 conference; Paris, France (13 May 1986).

After a presentation of the method suitable to measure the image intensifier performance we will demonstrate the advantages of double proximity focused MCP image intensifiers over electrostatic MCP and simple proximity focused diode intensifiers. We will then present some applications of image intensifiers in High Speed Photography: chronometry measurements in detonics, picosecond streak camera for temporal analysis of laser pulse shapes in laser matter interaction experiments electronic image readout of streak tubes by CCD.

16671 **(FEI—1663) Memory division module MDP.2.** Andriashin, A.V.; Mil'shin, V.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1985. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700698.

A division mechanism of a recording working memory device situated in the crate of an autonomous measuring site and performed in KAMAK standard is described. Interactions of functional assemblies of memory division module MDP.2, being the base of the whole mechanism, are described in detail. A block-diagram of MDP.2 as well as a list of instructions and formats of control registers are presented. 1 ref.; 4 figs.

16672 **(JINR—13-85-734) Reaction of hybrid circuit on the magnetic flux perturbation.** Kiselev, Yu.F.; Chernikov, A.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1985. 14p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700767.

Submitted to the journal Zh. Tekh. Fiz. .

Generalized expressions are obtained for sensitivity and relative frequency detuning of the Q-meter, Robinson's generator and squid. Influence of the cable length on the Q-meter sensitivity in measurements of the constant field value was experimentally studied at room temperature. Influence of the attenuation coefficient of a cable section between the mixing chamber and the evaporation chamber on the value and distortion of the NMR signal from deuterons was investigated at superlow temperatures. A criterion for estimating distortions was symmetry of nuclear susceptibility - at the quadrupole interaction - to the inversion with respect to the centre at the sign change of the deuteron spin temperature. The experiments confirm the theory well and lead to a conclusion that a superconducting cable may increase sensitivity and reduce distortions of the signal shape. 11 refs.; 6 figs.; 1 tab.

16673 **(N—87-13362) Space infrared telescope facility wide field and diffraction limited array camera (IRAC). Semi-annual status report, 1 March-31 August 1986.** Fazio, G.G. (Smithsonian Astrophysical Observatory, Cambridge, MA (USA)). Oct 1986. 69p. (NASA-CR—177041; NAS—1.26:177041; SASR—4). NTIS, PC A04/MF A01.

IRAC focal plane detector technology was developed and studies of alternate focal plane configurations were supported. While any of the alternate focal planes under consideration would have a major impact on the Infrared Array Camera, it was possible to proceed with detector development and optical analysis research based on the proposed design since, to a large degree, the studies undertaken are generic to any SIRTF imaging instrument. Development of the proposed instrument was also important in a situation in which none of the alternate configurations has received the approval of the Science Working Group.

16674 **(WAPD-TM—1616) An automated two-dimensional laser velocimeter system.** Ibrahim, B.B.; Hammond, R.B. (Bettis Atomic Power Lab., West Mifflin, PA (USA)). Feb 1987. Contract AC11-76PN00014. 15p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005625.

This document describes a laser velocimeter - minicomputer data acquisition system that is used in the measurement of fluid velocity. An automated traversing mechanism is also described. The data collection, processing, calculation and display of velocity plots in real-time is the principal feature of this system.

16675 **Tube wall thickness measurement apparatus.** Lagasse, P.R. (to Dept. of Energy, Washington, DC). US Patent 4,633,590. 6 Jan 1987. Filed date 21 Jun 1985. vp.

An apparatus is described for measuring the thickness of a tube's wall for the tube's entire length and circumference by determining the deviation of the tube wall thickness from the known thickness of a selected standard item, the apparatus comprising: a. a base; b. a first support member having first and second ends, the first end being connected to the base, the first support member having a sufficiently small circumference that the tube can be slid over the first support member; c. a spherical element, the spherical element being connected to the second end of the first support member. The spherical element has a sufficiently small circumference at its equator that the tube can be slid over the spherical element, the spherical element having at its equator a larger circumference than the first support member; d. a second support member having first and second ends, the first end being connected to the base, the second support member being spaced apart form the first support member; e. a positioning element connected to and moveable relative to the second support member; and f. an indicator connected to the positioning element and being moveable thereby to a location proximate the spherical element. The indicator includes a contact ball for contacting the selected standard item and holding it against the spherical element, the contact ball contacting the tube when the tube is disposed about the spherical element. The indicator includes a dial having a rotatable needle for indicating the deviation of the tube wall thickness from the thickness of the selected standard item, the rotatable needle being operatively connected to and responsive to the position of the contact ball.

16676 **Optical fiber inspection system.** Moore, F.W. (to Dept. of Energy, Washington, DC). US Patent 4,635,111. 6 Jan 1987. Filed date 5 Apr 1985. vp.

A remote inspection apparatus is described for optically inspecting exterior surfaces of objects, comprising: an enclosure; at least one inspection head mounted within the enclosure for receiving a supply of objects to be inspected; the inspection head having an object passageway extending downwardly thereinto, through which objects being inspected pass; collimating means for orienting the objects into a desired orientation for passage through the inspection head; transparent window means forming a section of the object passageway; lens means arranged circumferentially about the window means for gathering and transmitting light reflected from surfaces of the objects; light guide means receiving an optical image from the lens means and for conveying the optical images therethrough; a television camera for converting optical image conveyed by the light guide means into electronic signals representative of the optical images; signal processing means for integrating the electronic signals for producing a singular image of an object; a television monitor for converting the electronic signal into a visible image representative of surfaces of the objects; staging means for stationarily positioning an object within the window means so that exterior surfaces of the object can be viewed by the lens means; and light source guides adjacent to the window means for beaming light onto objects positioned upon the staging means.

16677 **Fiber optic moisture sensor with moisture-absorbing reflective target.** Kirkham, R.R. (to Dept. of Energy, Washington, DC). US Patent 4,634,856. 6 Jan 1987. Filed date 3 Aug 1984. vp.

A method is described for monitoring environmental moisture changes, comprising the following steps: locating an optical fiber assembly within the environmental area being monitored; transmitting light signals through the optical fiber assembly from a light source to and from a target whose reflectance is a function of the target's moisture content; measuring the returned light reflected by the target; and detecting changes in the light signals transmitted through the optical fiber assembly from the light source as an indication of the moisture conditions to which the optical fiber assembly is subjected.

16678 **(LA-UR—87-78) Modeling of buried explosions.** Gaffney, E.S.; Wohletz, K.H.; House, J.W.; Brown, J.A. (Los Alamos National Lab., NM (USA)). 1987. Contract W-7405-ENG-36. 15p. (CONF-870374—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004500.

From International symposium on the interaction of conventional munitons with protective structures; Mannheim, F.R. Germany (9 Mar 1987).

Los Alamos National Laboratory has been and continues developing techniques for modeling buried explosions using a large geotechnical centrifuge. When fully developed, the techniques should permit the accurate modeling of large explosions in complex geometries. Our intentional application is to study the phenomena of explosive cavity formation and collapse. However, the same methods should also be applicable to simulation of bursts shallow enough to produce craters, and perhaps even of airbursts in situations where soil overburden is important. We have placed primary emphasis on test bed construction methods and on accurate measurement of the ground shock produced by the explosions. 8 refs., 7 figs.

16679 **(SAND—86-2553C) An integral model of plume rise from high explosive detonations.** Boughton, B.A.; DeLaurentis, J.M. (Sandia National Labs., Albuquerque, NM (USA)). 1986. Contract AC04-76DP00789. 19p. (CONF-870816—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004517.

From Thermal hydraulics of severe nuclear reactor accidents/national heat transfer conference joint conference; Pittsburgh, PA, USA (9 Aug 1987).

A numerical model has been developed which provides a complete description of the time evolution of both the phyiscal and thermodynamic properties of the cloud formed when a high explosive is detonated. This simulation employs the integral technique. The model equations are derived by integrating the three-dimensional conservation equations of mass, momentum and energy over the plume cross section. Assumptions are made regarding (1) plume symmetry; (2) the shape of profiles of velocity, temperature, etc. across the plume; and (3) the methodology for simulating entrainment and the effects of the crossflow induced pressure drag force on the plume. With these assumptions, the integral equations can be reduced to a set of ordinary differential equations on the plume centerline variables. Only the macroscopic plume characteristics, e.g., plume radius, centerline height, temperature and density, are predicted; details of the plume intrastructure are ignored. The model explicitly takes into account existing meteorology and considers the alterations in plume behavior which occur when aqueous form is used as a mitigating material. The simulation was tested by comparison with field measurements of cloud top height and diameter. Predictions were within 25% of field observations over a wide range of explosive yield and atmospheric stability. 12 refs., 4 figs. 1 tab.

16680 **Short pulse initiation of detonation in a TATB explosive.** Dick, J.J.; Wackerle, J.D. (Los Alamos National Lab., Los Alamos, NM). pp 172 of Proceedings of the twenty-first symposium (international) on combustion. Pittsburgh, PA; Combustion Institute (1986). (CONF-860804—).

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

Detonation of a plastic-bonded triaminotrinitrobenzene explosive PBX 9502 was initiated by planar, short-shock pulses of an amplitude of 13.1 GPa and durations of 0.16 to 0.64 μs. In-material particle velocity vs time histories were obtained using the axisymmetric magnetic probe, and shock front trajectories were measured in wedge experiments.

16681 **(AD-A—174003/4/XAB) Inversion for source parameters of underground nuclear explosions with implications for yield estimation. Technical report, 5 September 1985-5 March 1986.** Barker, J.S.; Burger, R.W.; Burdick, L.J.; Lay. (Woodward-Clyde Consultants, Pasadena, CA (USA)). 15 Mar 1986. 130p. (WCCP-R—86-01). NTIS, PC A07/MF A01.

The first part of this report presents a method for simultaneous inversion of near-field explosion wave forms for parameters of the source and structure. The inversion automatically provides information on the trade-offs between parameters and error analyses of the resultant models. The source may be parameterized by any of several effective source functions. The structure is parameterized as a layered stack of gradients defined by the velocity at the top of the layer, the velocity gradient within the layer, and the depth to the top of the layer. The gradient model is then discretized into homogeneous plane layers, with the layer thickness defined as the wavelength of the predominant period in the data, and synthetics are computed using asymptotic generalized ray theory. For each observed wave form, the residuals consist of the normalized cross-correlation coefficient between the data and synthetics, the difference in normalization factors, and the time lag to the peak of cross-correlation. The second part of the report addresses the implications of choosing a particular representation of the RDP on the determination of teleseismic attenuation. This time-domain analysis is based on a near-field to far-field amplitude comparison. The near-field amplitude information is contained in the parameters of the explosion-source model, assuming amplitude information is contained in the parameters of the explosion-source model and assuming either the Mueller-Murphy or Helmberger-Hadley representations.

16682 **(DOE/ER/25009—388) Hypercube tracking: A preliminary status report.** Gottschalk, T.D.; Angus, I.G.; Fox, G.C. (California Inst. of Tech., Pasadena (USA)). 1985. Contract FG03-85ER25009;AC03-81ER40050. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005026.

This document summarizes completed activities and progress in the Caltech campus/JPL Hypercube tracking program as of 1 December 1986. The initial problem under investigation concerns track initiation for a 50 object threat during the first 100 seconds after launch. For multi-object launches from a single site, the principal initial difficulty is track is equivalent to hit association in a dense environment. Sequential and parallel programs which perform this track initiation task have been completed and are described in this note. Simple illustrations of performance on the hypercube are presented. A "menu" for possible, near future activities is also included. 6 refs., 9 figs.

16683 **(UCRL—95026-Rev.2) Nuclear explosives for peaceful purposes.** Borg, I.Y. (Lawrence Livermore National Lab., CA (USA)). Nov 1986. Contract W-7405-ENG-48. 33p. (CONF-8610136—3-Rev.2). NTIS, PC A03/MF A01; GPO Dep. File Number DE87002552.

From SIPRI/CLIPS study on a comprehensive test ban; Ottawa, Canada (23 Oct 1986).

The US Plowshare program, designed to develop peaceful uses of nuclear explosives, was vigorous between 1957-73 and was of concern during US and USSR nuclear treaty negotiations within that period. In order to accommodate possible future applications, the Peaceful Nuclear Explosions Treaty was signed in 1976. The US program explored the phenomenology of nuclear explosions and tested their use in industrial applications. Due to waning industrial interest and public concern over environmental issues, the US program was terminated in 1977. The Soviet counterpart to the Plowshare program, which has involved more than 100 experiments throughout the USSR, continued until the self-imposed moratorium in 1985. As any peaceful use of nuclear explosives has the potential of furthering weapons research, the US takes the position that all such experiments would have to be banned in a comprehensive test ban treaty. 24 refs.

16684 **(UCRL—95825) Nuclear weapon R and D and the role of nuclear testing.** Brown, P.S. (Lawrence Livermore National Lab., CA (USA)). 12 Dec 1986. Contract W-7405-ENG-48. 5p. (CONF-870124—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003815.

From General meeting of the American Physical Society; San Francisco, CA, USA (28 Jan 1987).

There are four fundamental reasons why we do nuclear tests: (1) to maintain confidence in the existing stockpile; (2) to modernize the stockpile for improved safety, security, survivability, and military effectiveness; (3) to assess the vulnerability of weapons to the nuclear threat environment posed by the weapons of our adversaries; and (4) to avoid technological surprise by maintaining the

scientific judgment necessary to understand the limits of weapon potential. These four are individually discussed.

4503 Explosion Detection

16685 **(UCRL—95155-Rev.1) On the degree of verification needed to support a comprehensive test ban.** Kidder, R.E. (Lawrence Livermore National Lab., CA (USA)). Dec 1986. Contract W-7405-ENG-48. 16p. (CONF-8610136—2-Rev.1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87004353.

From SIPRI/CLIPS study on a comprehensive test ban; Ottawa, Canada (23 Oct 1986).

The military significance of nuclear explosive tests is discussed and illustrated with the aid of the recent (1980 through 1984) US nuclear testing record. It is concluded that nuclear tests with yields that are but a small fraction of a kiloton are militarily significant, particularly for purposes of nuclear weapons research. These could be conducted in fully decoupled seismically quiet, reusable cavities, and would be well below the threshold of reliable detection and identification by seismic or other means presently under consideration. For this reason it is concluded that the degree of verification needed to support a CTB is not available at the present time. A Threshold Test Ban with explosive yields limited to five kilotons, as proposed by Defense Secretary Harold Brown, appears to present a much more realistic near-term possibility.

16686 **(KFK—4123) Report on the comparison of measurements between two monostatic Doppler-SODAR's manufactured by REMTECH.** Zimmer, J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Meteorologie und Klimaforschung). Aug 1986. 58p. (In German). NTIS (US Sales Only), PC A04/MF A01. File Number DE87750508.

The measurement data obtained by SODAR, viz. horizontal and vertical wind velocity, wind direction, as well as standard deviations of these values, have been compared with the corresponding data from the meteorological tower of the KfK. The correlation coefficients are discussed. In addition the availability of both units are compared. The final version of the SODAR apparatus is characterized by correlation coefficients from wind velocity and direction as well as from the vertical component, which are larger by 2-9%. The correlation of the standard deviation of the wind direction is small (0.1-0.5) for both units and was not discussed any further. The largest improvement was observed when comparing the drop-out time. Missing data of the final SODAR unit were much less frequent as compared to the results from the first test unit, especially for data taken above 200 m. For the maximum height of 420 m the improvement was about 60%.

16687 **(KFK—4124) Influence of stability classification on atmospheric diffusion calculations for elevated releases over a terrain of major roughness.** Hu Erbang; Thomas, P. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Meteorologie und Klimaforschung; Ministry of Nuclear Industry, Taiyuan, SX (China). Inst. of Radiation Protection). Aug 1986. 31p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750511.

A series of atmospheric tracer experiments with 100 m release height have been performed at the KfK over a terrain of major roughness. The concentration data of the tracers are used to validate the Gaussian plume model if the following methods of stability classification are used: Standard deviation of the vertical wind direction observed at 100 m height, standard deviation of the horizontal wind direction observed at 40 and 100 m heights as recommended by the USNRC, temperature differences between 30 and 100 m heights and 2 and 100 m heights as recommended by the USNRC. Different sets of dispersion parameters are applied in the Gaussian plume model: recommended by IAEA and derived from the KfK tracer data used in the validation. In this case the five methods of stability classification mentioned above are applied to derive the dispersion parameters. The validation is based on a linear regression analysis between the calculated and observed logarithms of the normalized diffusion factor and on the ratios of the calculated and observed normalized diffusion factors. The results demonstrate that the most qualified method of stability classification is that based on the standard deviation of the vertical wind direction. The method based on the standard deviation of the horizontal wind direction is better than those relying on the temperature differences. The dispersion parameters derived from the tracer concentrations used in the validation procedure yield slightly better results than those recommended by IAEA.

16688 **(KFK—4126) Evaluation of tetroon flights and turbulent diffusion under weak wind conditions during the field experiment SIESTA.** Hu Erbang; Vogt, S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Meteorologie und Klimaforschung; Ministry of Nuclear Industry, Taiyuan, SX (China). Inst. of Radiation Protection). Aug 1986. 35p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750510.

During several days in November 1985 an international field experiment took place in the Swiss plateau region near the cities of Aarau, Olten. As indicated by the name of the project SIESTA (SF/sub 6/ International Experiments in Stagnant Air) its aim is to obtain knowledge of the general nature of turbulence advection and atmospheric dispersion processes in a cold pool with very low wind speed and undefined wind direction. An outline of the general concept of the project is followed by a more detailed description of a special research activity with Radar tracked tetroons. In the second part of the report it is shown how to determine the horizontal dispersion parameter from the trajectories of the tetroon flights. Two different methods are described and the results of the flights performed during SIESTA are presented.

16689 **(NDP—002) Tree ring chronology indexes and reconstructions of precipitation in Central Iowa, USA.** Blasing, T.J.; Duvick, D.N. (Oak Ridge National Lab., TN (USA)). Sep 1984. Contract AC05-84OR21400. 3p. Oak Ridge National Lab., TN (USA).

Over sixty trees were sampled at each of the three Iowa sites; at least two cores were taken from most of the trees. The growth rings of each core were dated by calendar year, following standard procedures. Ring widths were measured to the nearest one-hundredth of a millimeter. Low-frequency variations resulting from tree age, changes in competitive status, and other nonclimatic factors were minimized by fitting a spline curve to the ring-width series and dividing each ring width by the value of the curve for the corresponding span. The average adjusted ring-width index for each year was computed from the indices of all cores at a site to obtain the chronology of ring-width indices (or tree ring chronologies) presented here. Based on the oldest tree samples, the initial years of the three chronologies in the study were 1635 at Pammel, 1654 at Duvick Back Woods, and 1663 at Ledges, Iowa. The sample sizes of the chronologies ranged from 6 to 16 cores by the year 1680 and increased steadily in each chronology after 1800. Indices are included for the three sites through 1981. A reconstruction of annual precipitation for central Iowa for the period 1860-1979 is based on these three chronologies.

16690 **(NDP—003) Surface air temperature anomalies for the Northern Hemisphere, 1881 - present.** Wigley, T.M.L.; Jones, P.D.; Kelly, P.M. (East Anglia Univ. (UK). Climatic Research Unit). Sep 1984. Contract AC05-84OR21400. vp. East Anglia Univ. (UK). Climatic Research Unit.

This report contains monthly and seasonal averages of surface air temperature anomalies obtained from a 5° x 5° gridded data base of surface air temperatures. Anomalies for the Arctic region are also included.

16691 **(NDP—008) Seasonal tropospheric and stratospheric temperature anomalies for the Northern Hemisphere, 1958-1983.** Angell, J.F.; Korshover, J. (National Oceanic and Atmospheric Administration, Silver Spring, MD (USA)). Sep 1984. Contract AC05-84OR21400. vp. National Oceanic and Atmospheric Administration, Silver Spring, MD (USA).

This report contains seasonal temperature-anomaly data for five atmospheric layers and the surface in five climatic zones both hemispheres, and the world.

16692 **(NDP—011) Global paleoclimatic data for 6000 yr B.P.** Webb, T. III. (Brown Univ., Providence, RI (USA)). Aug 1985. Contract AC05-84OR21400. vp. Brown Univ., Providence, RI (USA).

Pollen, lake level, and marine plankton data for the Holocene period (6000 yr B.P.) are documented in 53 datasets. The data are subdivided into nine groups by data type and geographic region for the pollen and marine plankton data types. Bibliographic citations associated with each site are included.

16693 **(NDP—012) Climatic data for Northern Hemisphere land areas 1851-1980.** Bradley, R.S.; Kelly, P.M.; Jones, P.D.; Goodess, C.M.; Diaz, H.F. (Massachusetts Univ., Amherst (USA); East Anglia Univ. (UK). Climatic Research Unit). Aug 1985. Contract AC05-84OR21400. vp. Massachusetts Univ., Amherst (USA).

Monthly temperature and precipitation data for stations in the Northern Hemisphere through 1980 are presented. This compilation of long term climatic data extends the World Weather Records database by ~ 700 temperature stations and ~ 1200 precipitation stations.

16694 **(NDP—014) Solar records: the Wolf sunspot index and umbral/penumbral ratio.** Hoyt, D.V. (National Oceanic and Atmospheric Administration, Boulder, CO (USA)). Aug 1985. Contract AC05-84OR21400. vp. National Oceanic and Atmospheric Administration, Boulder, CO (USA).

Annual Wolf sunspot numbers and umbral/penumbral (U/P) ratios are given for the period 1875-1981. The data are summarized from daily values and are as accurate a reconstruction as can be presently made.

16695 **(NDP—016) Climatic data for selected US and Canadian stations 1941-1980.** Karl, T.R.; Quinlan, F. (National Oceanic and Atmospheric Administration, Asheville, NC (USA)). Sep 1985. vp. National Oceanic and Atmospheric Administration, Asheville, NC (USA).

Monthly mean temperature and total precipitation data for 130 selected stations in the United States and Canada are given. Minimum and maximum monthly mean temperatures, as well as range of mean temperature are also included. The data are based on daily values.

16696 **Last pluvial climatic episodes in the deserts of southwestern North America.** Spaulding, W.G.; Graumlich, L.J. (Univ. of Washington, Seattle). *Nature (London);* **320**: No. 4, 441-444(3 Apr 1986).

Long-term variations in the effective moisture of deserts are linked both to glacial-interglacial climatic cycles and, through the Milankovitch theory, to orbitally induced changes in solar radiation intensity. For southwestern North America, comparison of paleobotanical data with model predictions of paleoclimate reveals two distinct pluvial regimes during the late Wisconsin and early Holocene (23-8 kyr BP). Southward displacement of the Aleutian low-pressure center and strengthened westerlies from ~ 40° to 30°N were important features of the full-glacial (~ 18 kyr BP) pluvial maximum. Increased cyclonic storms and weakened monsoons led to a winter precipitation regime a feature seen both in the fossil record and climate models. Dominantly zonal flow during this period contrasts with the latest Wisconsin and early Holocene (12-8 kyr BP), when meridional circulation transported maritime tropical air into the desert interior. They now show that plant macrofossil assemblages from packrat (Neotoma spp.) middens in the Mojave Desert provide evidence for increased temperatures and summer rainfall during this period. The anomalously late persistence (to ~ 8 kyr BP) of woodland in low-latitude, low-elevation deserts of the south-west is attributed to enhanced monsoonal circulation.

16697 **Geographical distribution and seasonality of persistence in monthly mean air temperatures over the United States.** Van Den Dool, H.M.; Klein, W.H.; Walsh, J.E. (Univ. of Maryland, College Park). *Monthly Weather Review;* **114**: 546-560(Mar 1986). Contract AS05-81EV10539.

Eighty years of monthly mean station temperatures are used to evaluate the persistence of monthly air temperature anomalies over the US. The geographical and seasonal dependencies of the monthly persistence are described in terms of the day-to-day persistence of temperature anomalies, the influence of the large-scale atmospheric circulation, and inferred associations with slowly varying properties of the earth's surface. The monthly persistence is generally smallest in the continental interior and largest in coastal regions. The seasonality of this spatial pattern is quite small, although the continental interior is characterized by a summer maximum. For the country as a whole, persistence is highest (0.30) in winter and summer and least (0.15) in fall and spring. For both raw and detrended data, the anomaly pattern correlations at lags of two and three months are much larger than would be expected from a first-order Markov process. The pattern of persistences computed using day-to-day autocorrelations shows that the presence of nearby bodies of water increases the month-to-month persistence over that to be expected from daily weather fluctuations. This finding is consistent with the results derived from an intuitive energy balance model in which the soil (or ocean) surface layers and the atmospheric boundary layer respond to prescribed daily fluctuations in the free atmosphere. Local surface influences are also implied by the fact that the 700-mb circulation-derived anomalies of monthly temperature have fewer spatial degrees of freedom than do the actual anomalies. While the large-scale circulation accounts for about half of the winter temperature persistence, small-scale effects, as well as the effects of the antecedent month's circulation, contribute substantially to the persistence of summer temperatures. 26 references, 13 figures, 3 tables.

16698 **Light diffusion through clouds and haze.** Max, N.L. (Lawrence Livermore National Lab., CA). *Computer Vision, Graphics, and Image Processing;* **33**: 280-292(1986). Contract W-7405-ENG-48.

This paper describes an algorithm for approximating the single scattering model for light diffusion through clouds or haze of constant optical density. The clouds are contained between two single valued surfaces. The algorithm assumes that the sun is directly overhead, but gives convincing pictures for other sun directions. Its efficiency comes from approximating the exponential decay of transmitted light by a quadratic polynomial, and from vectorization on the Cray 1.

16699 **January and July simulations with a spectral general circulation model.** Pitcher, E.J.; Malone, R.C.; Ramanathan, V.; Blackmon, M.L.; Puri, K.; Bourke, W. (Univ. of Miami, FL). *Journal of the Atmospheric Sciences;* **40**: 580-604(Mar 1983).

The authors describe the results of January and July simulations carried out with a nine-level spectral model, employing a rhomboidal truncation at wavenumber 15. Sea-surface temperature, sea-ice distribution and solar zenith angle are held constant in each simulation. The model includes interactive clouds and radiative processes after Ramanathan et al. Selected fields are shown which highlight the model's strengths and weaknesses. The latitude-height distribution of the zonal wind is successfully simulated. The model captures the separation between the wintertime westerly jets in the troposphere and stratosphere and thus simulates the sign reversal in the vertical wind shear across the jet axis in the upper troposphere. In addition to the zonal wind, they show also the zonally averaged temperature, meridional wind and vertical velocity. Regional distributions of sea-level pressure, surface air temperature, precipitation and a number of other fields defined at various pressure levels are compared in detail with observations. For the most part, the large-scale features of the observed general circulation are successfully simulated, although the sea-level pressure in the subtropics over continental regions in the wintertime is higher than observed, and

the model atmosphere tends to be a few degrees colder than observed. They offer a partial explanation for this last deficiency. There is good agreement between the model stratosphere and the actual stratosphere. Preliminary indications suggest the variability present in the model is comparable to that found in the atmosphere.

16700 **(CMP—002) IEA/ORAU long-term global energy-CO_2 model.** Edmonds, J.A.; Reilly, J.M. (Oak Ridge Associated Universities, Inc., TN (USA)). Aug 1984. Contract AC05-84OR21400. vp. Oak Ridge Associated Universities, Inc., TN (USA).

The IEA/ORAU Long-Term Global Energy-CO_2 Model is a mathematical model which makes projections concerning global energy and CO_2 emissions at 25-year intervals beginning in 1975 to the year 2100. These projections are based on economic, demographic, and energy interactions. The model consists of four parts: supply, demand, energy balance, and CO_2 emissions. Energy demand is a function of the population, economic activity, technological change, energy prices, and energy taxes and tariffs existing in each of nine global regions. The nine global regions include the following: the United States, Canada and Western Europe, OECD Pacific (Japan, Australia, and New Zealand), USSR and Eastern Europe, Centrally Planned Asia (China, et. al.), Middle East, Africa, Latin America, and South and East Asia. These regions may be altered by the user. Supply is dependent upon resource constraints, behavioral assumptions, and energy prices for the various regions. Energy balance brings the global energy supply and demand for fuels into balance. CO_2 emissions are determined by applying appropriate carbon coefficients (carbon release per unit of energy) at the points in the energy flow where carbon is released. The IEA/ORAU Long-Term Energy-CO_2 Model computes regional and world energy quantity outputs, energy prices, costs of production, and carbon emission results.

16701 **(CONF-840851—5) Global energy and carbon dioxide.** Reilly, J.; Edmonds, J. (Institute for Energy Analysis, Washington, DC (USA)). 26 Aug 1984. Contract AC05-76OR00033. 6p. NTIS, PC A02. File Number DE87004896.

From 2. IMACS symposium on energy modeling and simulation; Upton, NY, USA (26 Aug 1984).

The literature on energy and carbon dioxide (CO_2) emissions is reviewed and a brief overview of recent work using the IEA/ORAU long-term energy CO_2 model is given. It was designed to provide forecasts of carbon emissions explicitly based to energy and economic factors. Recent work has focused on developing three emissions scenarios; the extreme scenarios are presented as bracketing the range of likely future emissions rates. Ongoing work will use Monte Carlo techniques to assess uncertainty in future forecasts and attribute uncertainty to uncertainty in model assumptions and parameters. The paper concludes that the model and scenario construction exercises should serve to complement decisionmaking and interaction among scientists and policymakers.

16702 (EPRI-CS—4918-Vol.3, pp 20.1-20.16) **Identification, assessment, and control of fugitive particulate emissions.** Cowherd, C. Jr.; Kinsey, J.S.; Harmon, D.L. (Midwest Research Institute, Kansas City, MO). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

The US Environmental Protection Agency (EPA) has funded the preparation of a technical guidance document for the identification, assessment, and control of fugitive particulate emissions. The purpose of this document is to assist control agency personnel in evaluating fugitive emissions control plans and to assist industry personnel in the development of cost-effective control strategies. The document describes procedures for developing a cost-effective strategy for the control of fugitive particulate emissions within any specific plant or geographic setting. Also, it provides sources of data or, in some cases, the actual data needed to implement the procedures, along with fully worked examples. This paper summarizes the content of the above guidance document. Although a variety of control techniques applicable to sources of fugitive particulates are discussed, control efficiency values are specified only for those control options which have been tested for effectiveness. Also, greater emphasis is placed on open dust sources than on process sources. This is consistent with the larger body of available data on the performance of open dust source controls. Finally, procedures for the determination of control costs and cost-effectiveness are summarized, and cost elements are described for the major generic classes of fugitive controls. 10 references, 1 figure, 6 tables.

16703 (EPRI-CS—4918-Vol.3, pp 21.1-21.21) **Process fugitive particulates - design methods for enclosures.** Goodfellow, H.D.; Cesta, T.; Kashdan, E.R.; Coy, D.W.; Spivey, J.J.; Harmon, D.L. (Hatch Associates, Ltd., Toronto, Ontario). Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

Regulatory officials charged with the responsibility of reviewing hood systems for capture of process fugitive emissions face a difficult task. A manual has been prepared to provide these officials with a reference guide on the design and evaluation of hood systems and enclosures. This paper presents design methods for enclosures. In particular, enclosures for inertial process fugitive sources and for buoyant sources are discussed. Equations are given to estimate the required exhaust rate for the enclosures. Mechanical design considerations are listed for enclosures applied to buoyant sources. 5 references, 3 figures.

16704 (EPRI-CS—4918-Vol.3, pp 22.1-22.16) **Field evaluation of windscreens as a fugitive dust control measure for materials storage piles.** Zimmer, R.A.; Axetell, K. Jr.; Ponder, T.C. Jr. Nov 1986. Research Reports Center, Box 50490, Palo Alto, CA 94303. File Number TI87920155. (CONF-860213—Vol.3).

From 6. symposium on the transfer and utilization of particulate control technology; New Orleans, LA, USA (25 Feb 1986).

The Air and Energy Engineering Research Laboratory (AEERL) has instituted a coordinated program for development of a technology for the control of fugitive particle sources. The AEERL has identified windscreens as a promising control technique for one of the major sources - storage piles. Before this technology can be effectively applied, however, application criteria need to be developed. These criteria include (1) screen porosity, (2) screen width, (3) screen height, and (4) the distance between the screen and the pile. AEERL and the Environmental Sciences Research Laboratory (ESRL) have completed an in-house study designed to determine changes in windspeed (not changes in emissions) due to windscreens. The ESRL wind tunnel was used in experiments conducted to determine the optimal windscreen porosity, size, and location. Before this information could be applied to the design of windscreens, it was necessary to conduct a field study to validate the wind tunnel studies with respect to windspeed changes, and to determine the relationship between changes in windspeed and changes in fugitive dust emissions. During the summer of 1985, testing was performed simultaneously on two cone shaped piles of shredded topsoil 8 feet high and having a base diameter of 25 feet. One pile was exposed and the other was controlled with a 50% porosity windscreen. Sensors were located at the surface of each pile to determine windspeed. Exposure profiling towers with samplers at four heights were used to determine total particulate emissions. Windspeed data were collected continuously by an onsite computer. Profiler data were averaged for a complete test and selected filters were subjected to laser diffraction analysis to obtain particle size data. 13 references, 2 figures, 2 tables.

16705 **(N—87-11857) HALOE science investigation. Semiannual progress report, February-July 1986.** Benner, D.C. (College of William and Mary, Williamsburg, VA (USA)). 1986. 4p. (NASA-CR—179825; NAS—1.26:179825). NTIS, PC A02/MF A01.

The Halogen Occulation Experiment (HALOE) gas response test simulations were completed using the HALOE spectroscopic

instrument model. A new series of programs were written for routine repetitive runs of the spectroscopic model to make it more user friendly for certain studies. Some of the limitations of the model were eased for atmospheric studies. Atmospheric signal profiles were calculated for inclusion in the electronic model programs. Analysis of additional spectral bands of CO_2 in the 3 micron region was continued. A program of measurement of the air broadened halfwidths of spectral lines in the nu (sub 3) fundamental band of CH_4 was started and over 40 lines measured.

16706 **(N—87-12059) Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species. Final report, period ending June 1986.** Gormsen, B.B.; Tiwari, S.N. (Old Dominion Univ., Norfolk, VA (USA)). Aug 1986. 9p. (NASA-CR—179882; NAS—1.26:179882). NTIS, PC A02/MF A01.

Highly efficient methods were developed for the analysis and reduction of Measurement of Air Pollution from Satellite (MAPS) data. Specific attention was directed to analyzing the data from the Office of Space and Terrestrial Applications 3 (OSTA-3) correlative measurements of aircraft research flights and from the OSTA-3 shuttle flight. Methods were developed for error analysis of the aircraft and spacecraft instruments. The LSI 11/23 software system was modified and expanded for future data analysis.

16707 **(N—87-13022) Description of data on the Nimbus 7 LIMS map archive tape: ozone and nitric acid.** Remsberg, E.E.; Kurzeja, R.J.; Haggard, K.V.; Russell, J.M. III; Gordley, L.L. (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Dec 1986. 73p. (NASA-TP—2625; L—16136; NAS—1.60:2625). NTIS, PC A04/MF A01.

The Nimbus 7 Limb infrared monitor of the stratosphere (LIMS) data set has been processed into a Fourier coefficient representation with a Kalman filter algorithm applied to profile data at individual latitudes and pressure levels. The algorithm produces synoptic data at noon Greenwich Mean Time (GMT) from the asynoptic orbital profiles. This form of the data set is easy to use and is appropriate for time series analysis and further data manipulation and display. Ozone and nitric acid results are grouped together in this report because the LIMS vertical field of views (FOV's) and analysis characteristics for these species are similar. A comparison of the orbital input data with mixing ratios derived from Kalman filter coefficients indicates errors in mixing ratio of generally less than 5 percent, with 15 percent being a maximum error. The high quality of the mapped data was indicated by coherence of both the phases and the amplitudes of waves with latitude and pressure. Examples of the mapped fields are presented, and details are given concerning the importance of diurnal variations, the removal of polar stratospheric cloud signatures, and the interpretation of bias effects in the data near the tops of profiles.

16708 **(NDP—001) Atmospheric CO_2 concentrations Mauna Loa Observatory, Hawaii 1958-1983.** Keeling, C.D. (California Univ., San Diego, La Jolla (USA)). Sep 1984. Contract AC05-84OR21400. 3p. California Univ., San Diego, La Jolla (USA).

Carbon dioxide concentrations have been obtained throughout the sampling period using a nondispersive, dual detector, infrared gas analyzer. Air samples are obtained via air intakes at the top of 7m towers. Four of these towers exist, along with a 27m tower. The highest intake along with one of the lower intakes take four samples per hour. Air is sampled from one intake for 10 minutes, then from the second for 10 minutes, and then from a reference gas for 10 minutes. The intakes are actually maintained continuously, but are shunted when not being analyzed by the infrared gas analyzer. The air flow registers a voltage on the analyzer which then records the concentrations on a strip chart recorder. Two intakes are used to detect possible contamination. A sign of contamination, whether ambient or instrument, is evidenced by significant differences in CO_2 concentrations between the two paired intakes. Efforts to calibrate equipment, reduce the possibility of contamination, and to adjust data to represent uncontaminated, true conditions have been done and updated throughout the course of the project. Calibration of the gas analyzer by standardized CO_2-in-nitrogen reference gases is done twice daily. Flask samples are taken twice monthly to give a comparison to the data recorded using the infrared gas analyzer. Data is scrutinized daily for possible contamination and archived and magnetic tape for possible further scrutiny and adjustment. Daily, monthly, and annual averages are computed for the Mauna Loa data after deletion of con taminated samples and readjustment. These averages have shown a steady rise in the annual average concentration, from 316 ppmv in 1959 to 342 ppmv in 1983.

16709 **(NDP—004) Transient Tracers in the Oceans (TTO) hydrographic data and carbon dioxide systems.** (Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)). Sep 1984. Contract AC05-84OR21400. 3p. Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.).

The Transient Tracers in the Ocean (TTO) study was an experiment to investigate the manner and time scale of ocean mixing, as deduced from the distribution of radiochemical tracers injected into the atmosphere and then the oceans, in the time period 1958-1962 from nuclear bomb tests. These observations, with careful investigation of oceanic CO_2 properties, provide unique constraints on oceanic uptake of fossil fuel CO_2. The experiment followed a four year plan: preparation, calibration and test cruise (1980), field work (1981), laboratory analysis (1982) and completion, data analysis and reporting (1983).

16710 **(NDP—017) Major world ecosystem complexes ranked by carbon in live vegetation: a database.** Olson, J.S.; Watts, J.A.; Allison, L.J. (Oak Ridge National Lab., TN (USA)). Sep 1985. Contract AC05-84OR21400. vp. Oak Ridge National Lab., TN (USA).

Estimation of the inventory of carbon in major world ecosystems and of the exchanges with the atmosphere and other major reservoirs has thus been approached in two ways. In the major reservoirs has thus been approached in two ways. In the first approach, development of broad global patterns uses potential vegetation maps, or associates vegetation types with climatic or other environmental factors independent of local disturbance. In the second approach, development of modern regional or stand-type estimates is based on analyses of current vegetation and land-use practices. This method uses updated resource maps of natural vegetation, forestry surveys, agricultural yields, and human and economic as well as geopolitical considerations. Both approaches were applied in the development of the ecosystem map. The personal judgment of experts about ecosystem types, their locations and extent, and likely biomass or carbon in landscape complexes representative of different parts of the world is crucial in either approach.

16711 **(NP—7770063) Study including experiments on the diffusion emissions caused by accidents.** Hahn, W. (Stuttgart Univ. (Germany, F.R.)). 25 Feb 1985. 198p. (In German). NTIS (US Sales Only), PC A09/MF A01. File Number DE87770063.

To perform the study on the diffusion behaviour of pollutant clouds, soot was released from several pressure vessels to simulate real emissions due to an accident. The clouds thus created were registered by photographic means in northern Germany to a distance of up to 1936 m from the source of emission. To determine the position of the cloud, photographic registration took place from several angles. The quantitative assessment of the cloud photograms was done through the use of a digital image analyzing system. From the cloud photograms the average mass distribution of the soot within the cloud was determined. From the mass distribution curves were statistically derived: scatter parameters for wind, horizontal and vertical direction.

16712 **(PB—86-210598/XAB) Air quality data - 1985 annual statistics including summaries with reference to standards. Annual report.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Sep 1986. 379p. (EPA—450/4-86/008). NTISMF A01.

See also PB85-214237; Microfiche copy only (one sheet of 48X reduction.

The report presents comprehensive summaries of data produced by the Nation's ambient air-quality monitoring activities for 1985. The data are summarized in two formats: frequency distributions (Part I) and status of data with reference to standards (Part II). These summaries are based on data acquired through extensive monitoring activities conducted by federal, state, and local pollution-control agencies and submitted to the U.S. Environmental Protection Agency's National Aerometric Data Bank. Information is provided on the six pollutants for which National Ambient Air Quality Standards have been set: total suspended particulates, carbon monoxide, sulfur dioxide, nitrogen dioxide, lead, and ozone.

16713 **(PB—87-108395/XAB) Industrial-hygiene survey report, Precision Castparts Corp., Portland, Oregon.** Clapp, D.E. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). Jun 1984. 25p. (IWS—134-14). NTIS, PC A02/MF A01.

Industrial hygiene data were collected during a reproductive health study of workers exposed to 2-ethoxyethanol (2EE) at Precision Castparts Corp. Portland, Oregon. Air concentrations of 2EE were high, most likely as a consequence of the nature of the investment-casting process. Twenty two of 27 personal air samples exceeded 5 parts per million (ppm), with an average of 10.7 ppm. All environmental measurements were below the prevailing OSHA Permissible Exposure Limit of 200 ppm. Persistent, detectable concentrations of ethoxyacetic-acid (EAA), a suspected major metabolite of 2EE, were found in urine samples from exposed workers but not in samples from unexposed subjects. The author concludes that urinary monitoring can be used for assessing exposure to 2EE, particularly if there is skin exposure. The author recommends a follow-up reproductive health study to judge impairment of reproductive function. 2EE use has been discontinued at this facility. As the process was not changed, the substitute solvent may be rapidly vaporized into the air resulting in high concentrations that must be evaluated.

16714 **(PB—87-109591/XAB) Interlaboratory study of benzene stability of tedlar bags. Final report.** Shikiya, J.; Daymon, D.; Tsou, G.; Imada, M. (California State Air Resources Board, Sacramento (USA)). Sep 1984. 45p. (ARB/HS—86/01). NTIS, PC A03/MF A01.

A study was initiated to determine the long-term stability of benzene vapors stored in Tedlar (polyvinyl fluoride) bags because the Air Resources Board and other air-monitoring agencies have adopted the technique of using these bags to collect samples. Many times, due to the analytical work load in the organic analysis laboratory, these samples may have to wait a number of days before their analysis can be performed. To validate the results, it was necessary to determine the stability of benzene in these bags. The Sampling Technique and Analysis Methods Subcommittee of the Toxic Air Monitoring Technical Advisory Committee (TAMTAC) proposed a study at concentrations of ambient and source levels (10-50 ppb and 5-20 ppm). The average concentration of the ambient range (10-50 ppb) of benzene vapor was 98.5% of the initial concentration after seventy-two hours of storage in the Tedlar bags and, after 150 hours, the average concentration was 92.3% of the initial value. The average concentration of the source level (5-20 ppm) average of the initial concentration was 96% after seventy-two hours and 92.5% after 150 hours.

16715 **(PB—87-110482/XAB) Characterization of stack emissions from municipal refuse-to-energy systems. Final report.** Howes, J.E.; Kohler, D.F.; DeRoos, F.L.; Riggin, R.M.; Barbour, R.L. (Battelle Columbus Labs., OH (USA)). Oct 1986. 104p. NTIS, PC A06/MF A01.

Stack emissions from three municipal refuse-to-energy systems were characterized: refuse-derived fuel (RDF), mass burning (MASS), and modular (MOD). A comprehensive set of measurements was performed at each site to determine the physical and chemical properties of the particulate and gaseous stack emissions. The physical characterization included measurement of the mass concentration and size distribution of the stack particulate matter. Inorganic chemical characterization of the stack emissions included determination of the elements, anions, and compounds present in the fly ash, measurement of gaseous HCl and HF emissions, and determination of volatile trace-element levels. The characterization of organic materials in the stack emissions included specific measurements for polynuclear aromatic hydrocarbons (PAH), tetrachlorinated dibenzo-p-dioxins (TCDD) and dibenzofurans (TCDF), and aldehydes. Screening analyses were performed to provide tentative identification of organic compounds in the stack emissions.

16716 **(PB—87-110961/XAB) Assessment of assay methods for evaluating asbestos abatement technology at the Corvallis Environmental Research Laboratory.** Karaffa, M.; Amick, R.; Crone, A.; Zimmer, C. (PEI Associates, Inc., Cincinnati, OH (USA)). Oct 1986. 78p. NTIS, PC A05/MF A01.

Air sampling was conducted at an EPA office building which had undergone an asbestos abatement program. The aggressive sampling technique revealed that air-entrainable asbestos remained in work areas after completion of abatement actions. The ratio of aggressive-to-nonagressive PCM fiber concentrations was 7.0, whereas this ratio was 3.7 for TEM analyses. Study results also confirm that, under similar sampling conditions, TEM analysis detects more fibers than PCM because of TEM's better resolving capability. The ratio of TEM/PCM concentrations for nonagressive sampling was 3.0 for ambient samples and 3.3 for indoor samples; the ratio for agressive sampling was about 2. Because the PCM method does not discriminate between asbestos and other fibers, and cannot resolve fibers thinner than about 0.2 micrometer, PCM results may not accurately reflect the true hazard potential.

16717 **(PB—87-111134/XAB) Demonstration, operation, and testing of a fabric filter on an industrial boiler for an extended period of time. Final report, March 1981-November 1982.** Greiner, G.P.; Smith, J.K.; Ross, J.M.; McKenna, J.D. (ETS, Inc., Roanoke, VA (USA)). Sep 1986. 51p. NTIS, PC A04/MF A01.

The report gives results of an evaluation of gas-to-cloth (G/C) ratios and a variety of fabrics in baghouses controlling particulate emissions from coal-fired industrial boilers. Procedures for increasing the G/C ratio were evaluated in a pulse-jet baghouse. A second baghouse of the same size, but with reverse-flush cleaning, was used to study several types of woven and felted fabrics. Typical of textile-plant boiler operations, the baghouses were subjected to fluctuating load requirements and frequent dewpoint excursions. Under these conditions, it was found that off-line high-energy pulse-jet cleaning was necessary for long term pressure drop stability at G/C ratios above 5. Cleaning energy was found to have a major effect on pressure-drop performance, but cleaning frequency registered an insignificant effect within the 6- to 20-minute range studied. Among fabrics, a new combination felted fabric, composed of Teflon and glass, showed excellent performance and stability under a long bag life.

16718 **(PB—87-111142/XAB) Hydroxyl-radical rate-constant intercomparison study. Final report.** Edney, E.O.; Corse, E.W. (Northrop Services, Inc., Research Triangle Park, NC (USA)). Oct 1986. 34p. NTIS, PC A03/MF A01.

An intercomparison study was conducted to evaluate the OH rate-constant measurement protocol developed by researchers at the University of California at Riverside. Researchers used the protocol to measure the room-temperature OH rate constants for ethane, benzene, chlorobenzene, and sec-butanol. The room-temperature OH rate constants determined by NSI-ES and UNC were in good agreement and also, with the exception of the previously unreported rate constant for sec-butanol, agreed with the literature values. Agreement was found using both methods of analysis. The rate constants for ethane, benzene, and chlorobenzene obtained by RTI using the time-excluded method also agreed with the literature values; however, when the same data were analyzed using the time-included method, no such agreement was found. It was not possible to identify the source of the discrepancy.

16719 **(PB—87-111332/XAB) Hanford 67-series: atmospheric field-diffusion measurements, micrometeorological and tracer data archive, Set 003 documentation report. Interim report.** Droppo, J.G. (Pacific Northwest Lab., Richland, WA (USA)). Oct 1986. 56p. NTIS, PC A04/MF A01.

An archive for micrometerological and tracer-dispersion data was developed by Battelle, Pacific Northwest Laboratories for the U.S. Environmental Protection Agency. The archive is designed to make the results of extensive field tests readily accessible to EPA for model testing, development, and verification efforts. The report provides documentation for one volume of data sets, the Hanford 67-Series Atmospheric Dispersion Experiments. The entries in the documentation report are as follows: data set fact summary, narrative description of experiment and data, special information, references, description of archive data files, contacts (names, addresses, and phone numbers) and standard experiment summary table.

16720 **(PB—87-111720/XAB) Precision and accuracy assessments for state and local air-monitoring networks, 1984.** Rhodes, R.C.; Evans, E.G. (Environmental Protection Agency, Research Triangle Park, NC (USA). Environmental Monitoring and Systems Lab.). Aug 1986. 188p. (EPA—600/4-86/031). NTIS, PC A09/MF A01.

Precision and accuracy data obtained from state and local agencies during 1984 are summarized and compared to data reported earlier for the period 1981-1983. A continual improvement in the completeness of the data is evident. Improvement is also evident in the size of the precision and accuracy results reported. Annual results from each reporting organization are also given so that these organizations can compare their results for 1984 with their earlier results and with other organizations. A set of upper and lower limits for precision and accuracy is also proposed -- above these limits corrective action should be taken. A comparison of the precision and accuracy data from the Precision and Accuracy Reporting System and that from the independent performance audit program conducted by the Environmental Monitoring Systems Laboratory is given.

16721 **(PB—87-112330/XAB) Sensitivity analysis of RELMAP (Regional Lagrangian Model of Air Pollution) involving fine and coarse particulate matter.** Eder, B.K. (Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab.). Oct 1986. 9p. (EPA—600/D-86/248). NTIS, PC A02/MF A01.

The REgional Lagrangian Model of Air Pollution (RELMAP) is a mass-conserving, regional-scale, Lagrangian model that simulates ambient concentrations as well as wet and dry deposition of SO_2, SO_4^{2-}, and more recently fine (diameters$<2.5\mu m$) and coarse ($2.5 <$ diameter $< 10.0\mu m$) particulate matter over the eastern third of the United States and southeastern Canada. The simulations of fine and coarse particulate matter, which involve simple parameterizations, were recently incorporated into the model in response to impending federal regulatory standards for inhalable particulate matter and the subsequent need for size discriminate models. These new parameterizations, which include the transformation of SO_2 into SO_4^{2-}, and the wet and dry deposition of fine and coarse particulate matter were allowed to vary within + or- 50% of their respective nominal values in order to determine the model's sensitivity to them. Future research should concentrate on refining the wet-deposition parameterizations, as they not only prove to be the most influential in the model's output, but they are also currently the least understood.

16722 **(PB—87-113221/XAB) Report on the parallel ambient sampling project for selected organic toxics. Final report.** Kowalski, J.; Shikiya, J.; Tsou, G.; Imada, M. (California State Air Resources Board, Sacramento (USA)). Sep 1986. 50p. (ARB/HS—86/02). NTIS, PC A03/MF A01.

All samplers were colocated and used in the same time frame, but there were differences in sample flow rates, sample volumes, and how the samples were collected (all the laboratories used bag samplers with Tedlar bags except the AIHL facility which used sorbent tubes with activated carbon). A comparison of the data shows good agreement considering the complexities of measuring low level (ppb and sub-ppb) ambient toxic compounds. Data conformity was achieved in spite of a lack of a traceable standard and the inexperience of some of the participants in measuring trace quantities. Trichloromethane was the only compound whose range of analytical results did not agree within one order of magnitude. The relative standard deviation for the other compounds ranged from 14 to 84 percent.

16723 **(PB—87-113783/XAB) Preliminary assessment of air emissions from aerated waste-treatment systems at hazardous-waste-treatment storage and disposal facilities. Final report.** Allen, C.C.; Green, D.A.; White, J.B.; Coburn, J.B. (Research Triangle Inst., Durham, NC (USA)). Oct 1986. 150p. NTIS, PC A07/MF A01.

Methods for estimating emissions resulting from mass transfer of volatile organic compounds from dilute waste waters into air are reviewed and applied to full-scale and pilot-scale treatment systems.

16724 **(PB—87-113973/XAB) Locating and estimating air emissions from sources of ethylene oxide.** (Radian Corp., Durham, NC (USA)). Sep 1986. 80p. NTIS, PC A05/MF A01.

To assist groups interested in inventorying air emissions of various potentially toxic substances, EPA is preparing a series of documents such as this to compile available information on sources and emissions of these substances. The document deals specifically with ethylene oxide. Its intended audience includes federal, state, and local air-pollution personnel and others interested in locating potential emitters of ethylene oxide and in making gross estimates of air emissions therefrom. The document presents information on (1) the types of sources that may emit ethylene oxide, (2) process variations and release points that may be expected within these sources, and (3) available emissions information indicating the potential for ethylene oxide release into the air from each operation.

16725 **(PB—87-117156/XAB) Development of a coherent optical particle spectrometer for industrial applications: a feasibility investigation.** Liu, H.T.; Bachalo, W.D. (Flow Industries, Inc., Kent, WA (USA)). Oct 1984. 32p. (FLOW/TR—306/09-84). NTIS, PC A03/MF A01.

The feasibility of developing a particle-sizing instrument for in-situ measurements in industrial environments, based on the method of optical heterodyne or coherent detection, was investigated. The instrument, a coherent optical particle spectrometer, or COPS, is potentially capable of measuring several important particle parameters, such as particle size, number density, and speed, because of the versatility of the optical heterodyne method. Water droplets generated by an aerosol/particle generator were used to test the performance of the COPS. Study findings have shown that the optical setup of the COPS is extremely sensitive to even minute mechanical or acoustic vibrations. At the optimal setup, the COPS performs satisfactorily and has more than adequate signal-to-noise even with a 0.5 mW He-Ne laser.

16726 **(PB—87-117602/XAB) Health-hazard evaluation report HHE-80-022-OC, Tetley, Inc., Williamsport, Pennsylvania.** Castellan, R.M. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). 1980. 30p. (NIOSH-TR-HHE—80-022-OC). NTIS, PC A03/MF A01.

Employee exposure to tea dust was evaluated for possible respiratory health effects. Personal and area airborne dust samples, taken along with area samples quantifying airborne fungi, and a noise survey comprised the tests run at the facility. The particle size distribution of the dust was such that much would be deposited in the nose and throat. This might explain the frequent upper respiratory problems experienced by Tetley workers. Airborne fungi concentrations were not directly related to gravimetric dust concentrations. According to the author, results suggest that health problems related to occupational exposure to tea dust, and possibly also to noise, exist among workers at the facility. Results also demonstrated the effectiveness of engineering controls for reducing potential work-place exposures in that the lowest fungal count was obtained nearby the tea-bag reclaiming process, which at the time was being conducted under a specially designed ventilation hood. Noise survey results indicated that recommended NIOSH levels were being exceeded in many instances.

16727 **(PB—87-118634/XAB) Results of 1984 architectural coatings sales survey. Final report.** Nyarady, J.F. (California State Air Resources Board, Sacramento (USA)). Jul 1986. 70p. (ARB/SS—86/03). NTIS, PC A04/MF A01.

In 1985 the California Air Resources Board (ARB) conducted a survey of architectural coatings sold in California in 1984. The survey asked for the 1984 sales in gallons, the organic solvent content in grams per liter, volume percent and weight percent solids, and recommended thinning for both water-borne and solvent-borne coatings in 37 categories. Over 140 manufacturers responded to the survey. The report presents in summarized form the information gathered by the survey. In addition, the report presents the possible emissions reductions that would be achieved if certain final photochemically reactive organic compound (PROC) limits were to go into effect limiting the amount of organic solvents manufacturers could use in their coatings. The report also presents limited information from a 1980 architectural coatings survey conducted by the ARB.

16728 (PB—87-122156/XAB) **Atmospheric-dispersion index for prescribed burning. Forest Service research paper.** Lavdas, L.G. (Forest Service, Asheville, NC (USA). Southeastern Forest Experiment Station). 14 Nov 1986. 39p. (FSRP-SE—256). NTIS, PC A03/MF A01.

A numerical index that estimates the atmosphere's capacity to disperse smoke from prescribed burning is described. The physical assumptions and mathematical development of the index are described in detail. The index is expressed as a positive integer in such a way that doubling the index implies a doubling of the estimated atmospheric capacity. The dispersion index is conceptually similar to ventilation factor but is better able to describe diurnal changes within the lower atmosphere. The index provides a guide to the effect of prescribed burning activity on atmospheric smoke concentration during a portion of a day.

16729 (PNL—5750-Pt.5, pp 1-6) **Effect of areal averaging on performance of a long-range acidic deposition.** Feb 1986. NTIS, PC A04/MF A01. File Number DE86011909.

In Pacific Northwest Laboratory annual report for 1985 to the DOE Office of the Assistant Secretary for Environment, Safety and Health. Part 5. Overview and assessment.

The Office of Environmental Analysis represents the Department of Energy's interests in the federal regulatory development process, maintains comprehensive environmental data bases, conducts anticipatory analyses for early identification and scoping of emerging regulatory issues, and provides environmental technical support and guidance to Departmental programs.

16730 **A study on the systematic control of CO/sub 2/ emissions from fossil-fuel power plants in the U.S.** Cheng, H.C.; Steinberg, M. (Process Sciences Div., Dept. of Applied Science, Brookhaven National Lab., Upton, NY). *Environmental Professional, The;* **5**: No. 4, 245-255(Nov 1986).

The increase in atmospheric CO/sub 2/ which results primarily from combustion of fossil fuels for energy, could cause dramatic global climatic and environmental changes-the so called "greenhouse effect." This study explores the technical feasibilities and the cost of controlling CO/sub 2/ emissions from the stacks by removing, recovering, and disposing of CO/sub 2/ from fossil-fuel power plants in the U.S. It is estimated that up to a 10% reduction in the annual incremental atmospheric CO/sub 2/ content would be achieved by the study control system. The total power required for such a control system ranges from 11 to 16% of the power-generating capacity in various regions of the U.S. Overall, the study system could essentially increase the capital investment of a power plant by 70 to 150%, and increase production cost of electricity by 56 to 100%, depending on the location of the plant.

16731 **Measuring dry deposition: a re-assessment of the state-of-the-art.** Hicks, B.B. (NOAA/ERL Air Resources Lab., Oak Ridge, TN, USA). *Water, Air, and Soil Pollution;* **30**: No. 1-2, 75-90(Sep 1986). (CONF-850944—).

From Muskoka conference: international symposium on acidic precipitation; Toronto, Ontario, Canada (15 Sep 1985).

The exchange process known as dry deposition encompasses the dynamic exchange of trace gases and aerosol particles, and the gravitational settling of large particles. Except for particles large enough that their sedimentation velocity exceeds turbulent velocities, the rate of deposition is mostly determined by surface properties, such as roughness, stickiness, and wetness, and by atmospheric stability. Thus, it is difficult to interpret results obtained using collection devices having surfaces different from those of nature. Other methods for measuring dry deposition exist, mostly micrometeorological, but these are sufficiently complicated that routine application as in a monitoring network is not yet feasible. For some chemical species and in some locations, inferential methods offer considerable promise. These methods measure atmospheric concentrations (C) of the relevant chemical species, and derive relevant deposition velocities (v/sub d/) on a site-specific, species-dependent, and time-evolving basis. The dry deposition rates of interest are then evaluated as the product v/sub d/.C. A major goal of current research programs is to provide the knowledge necessary to evaluate v/sub d/. Experimental methods are reviewed, and potential sources of error are examined, for both the research methods and the 'concentration monitoring' methodologies presently being advocated for use in numerical models as well as for routine monitoring. 36 refs.

16732 **Chemical composition of precipitation at Long Island, NY.** Lee, Y.N.; Shen, J.; Klotz, P.J. (Brookhaven National Lab., Upton, NY, USA). *Water, Air, and Soil Pollution;* **30**: No. 1-2, 143-152(Sep 1986). (CONF-850944—). Contract AC02-76CH00016.

From Muskoka conference: international symposium on acidic precipitation; Toronto, Ontario, Canada (15 Sep 1985).

Chemical analyses were performed on 387 sequential precipitation samples, both rain and snow, collected at Brookhaven National Laboratory, Long Island, New York, on 96 different days during the period from October 1983 to June 1985. The collection time for each individual sample was typically 30 min. The chemical species determined and the volume-weighted average and maximum concentrations were: H/sub 2/O/sub 2/, H/sub 2/CO, H/sup +/, NO/sub 3//sup -/, SO/sub 4//sup 2-/, NH/sub 4//sup +/, Ca/sup 2+/, Na/sup +/, and Cl/sup -/. A strong seasonal dependence was observed for H/sub 2/O/sub 2/ concentration, the maximum concentration in summer being 6 times greater than in winter. In addition, H/sub 2/O/sub 2/ concentration also exhibited a strong diurnal variation, with a maximum peaking in the afternoon and a minimum after midnight. These observations suggest that the production of H/sub 2/O/sub 2/ may be governed by photochemical activity. Nitrate concentration also displayed a strong diurnal variation, having a maximum around noon, but did not show a seasonal dependence. Relationships between various species and their possible sources are briefly discussed. 21 refs.

16733 **A review of the chemical record in lake sediment of energy related air pollution and its effects on lakes.** Norton, S.A. (Maine Univ., Orono, USA). *Water, Air, and Soil Pollution;* **30**: No. 1-2, 331-345(Sep 1986). (CONF-850944—).

From Muskoka conference: international symposium on acidic precipitation; Toronto, Ontario, Canada (15 Sep 1985).

Inter-lake variation in accumulation rates of energy-related elements is a function of gross sedimentation rate (sediment focusing), position on pollution gradients, and water chemistry. Accumulation rates of Pb in lake sediments from profundal area cores in the Adirondack Mountains of New York and northern New England range from 0.1 to 0.2 ug/cm/sup 2//y (pre-1800 A.D.) to as much as 2 ug/cm/sup 2//y (recent sediment). Rates increase from the late 1800's to nearly the present, in parallel. Accumulation rates for V remain at background values which range up to 0.5 ug/cm/sup 2//y and increase 5 to 10 x background in Adirondack Mountain lakes. Chronically acidic lakes have a subsurface maximum. Of these three metals, only Pb has elevated deposition rates in high elevation lakes in the Rocky Mountains of Colorado. Mining activity is believed responsible for the implied air pollution there. 42 refs.

16734 **Detection of changes in the global troposphere temperature field induced by greenhouse gases.** Barnett, T.P. (Univ. of California, San Diego). *Journal of Geophysical Research;* **91**: No. D6, 6659-6667(20 May 1986). Contract AC03-76SF00098.

Several approaches to detecting the existence of a theoretically predicted CO_2-induced signal in the global temperature field are investigated. It appears that a relatively thin network of observing stations can, when properly analyzed, provide a first-order esti-

mate of global-scale temperature change and that this measurement is not necessarily the global average temperature. Using these stations, it is possible to estimate the strength of an a priori CO_2 signal in the three dimensional tropospheric temperature field. This signal is derived from two different general circulation model simulations, both with some form of interactive oceans. The observed signal strength over 1960-1980 is roughly 0.5-1.0 times that expected theoretically. The observed signal demonstrated a trend that is marginally significant.

16735 **Temperatures rise in the global greenhouse.** Gribbin, J. *New Scientist (London);* vp(15 May 1986).

By the end of the next century, the greenhouse effect may increase temperatures worldwide to levels that have not been reached for at least 100,000 years. And the effects on sea level and on agriculture and other human activities are likely to be so profound that they should be planning for them now. This is the gist of a major study of the potential climatic effects of the build-up of carbon dioxide in the atmosphere, carried out for the US Department of Energy, and just published as four reports.

16736 **Relationship between atmospheric CO_2 variations and a satellite-derived vegetation index.** Tucker, C.J.; Fung, I.Y.; Keeling, C.D.; Gammon, R.H. (NASA/Goddard Space Flight Center, Greenbelt, MD). *Nature (London);* 319: 195-199(16 Jan 1986). Contract AC05-84OR21400.

Estimates derived from satellite data of photosynthetically active radiation absorbed by terrestrial vegetation correlate with atmospheric carbon dioxide concentrations measured at surface recording stations, suggesting that satellite data can used to estimate terrestrial photosynthesis. 37 references, 4 figures, 1 table.

16737 **Changing carbon cycle: a global analysis.** Trabalka, J.R.; Reichle, D.E. (eds.). Oak Ridge, TN; Oak Ridge National Laboratory (1986). 600p.

An attempt is made to examine current knowledge about the fluxes, sources, and sinks in the global carbon cycle, as well as our ability to predict changes in atmospheric CO_2 concentration resulting from anthropogenic influences. The reader will find authoritative discussions of: past and expected releases of CO_2 from fossil fuels; the historical record and implications of atmospheric CO_2 increases; isotopic and geological records of past carbon cycle processes; the role of the oceans in the global carbon cycle; the influence of the world biosphere on changes in atmospheric CO_2 levels; and, evidence linking the components of the global carbon cycle.

16738 **General circulation model CO_2 sensitivity experiments: snow-sea ice albedo parameterizations and globally averaged surface air temperature.** Washington, W.M.; Meehl, G.A. (National Center for Atmospheric Research, Boulder, CO). *Climatic Change;* 8: 231-241(1986).

Two experiments are performed with the NCAR Community Climate Model (CCM) coupled to a swamp ocean with annually averaged solar forcing. A swamp ocean model is one in which the ocean temperature is computed from a surface energy balance. Both experiments are run with present (1 x CO_2) and doubled (2 x CO_2) amounts of atmospheric carbon dioxide (CO_2). The first tests the sensitivity of the model to a snow and sea-ice-albedo formulation which facilitates relatively greater ice melt. The second assesses the model response when the basic state of the model in the control run is colder due to a 2% decrease in solar constant. Both are compared to a previous experiment with the same model using a different snow and sea-ice-albedo formulation and the present value of the solar constant. It is found that the globally averaged surface air temperature increase due to a doubling of CO_2 is highly dependent on (1) the type of snow-sea-ice-albedo formulation used such that the parameterization which better facilitates relatively greater ice melt exhibits a greater sensitivity to increased CO_2, and (2) the basic state of the control run such that the colder the basic state, the greater the warming due to increased CO_2.

16739 **Carbon dioxide increase in the atmosphere and oceans and possible effects on climate.** Chen, C.T.A.; Drake, E.T. (Oregon State Univ., Corvallis). *Annual Review of Earth and Planetary Sciences;* 14: 201-235(1986). Contract AC05-84OR21400.

Scientists have been aware of the potential consequences of changes in the atmospheric CO_2 level for many decades. Late nineteenth century investigators were especially impressed by the impact of the Industrial Revolution on the level of atmospheric CO_2. Modern scientists are alert to the accelerated effects of the same trends resulting from society's effort to meet the needs of an ever-growing world population. While the interaction of all the various factors may have either a compounded impact or a canceling effect, it is clear that two main factors emerge as the crux of the problem: the continued use of fossil fuels, and the large-scale deforestation necessary to provide land for cultivation of food.

16740 **Evaluation of gas data from high-temperature fumaroles at Mount St. Helens, 1980-1982.** Gerlach, T.M.; Casadevall, T.J. (Sandia National Labs., Albuquerque, NM). *Journal of Volcanology and Geothermal Research;* 28: 107-140(1986). Contract AC04-76DP00789.

The Mount St. Helens fumarole gases show linear composition trends during periods of noneruptive degassing between September 1980 and October 1981. The trends are characterized by increasing H_2O and decreasing CO_2 and sulfur. Maximum fumarole temperatures also show a linear decrease during this period. High-temperature fumarole gases collected from the crater and dome between September 1980 and July 1982 are all H_2O-rich (> 90%) with 1-10% CO_2 and small amounts of H_2S, SO_2, H_2, CO, HC, and HF. Trace amounts of COS and S_2 are present, and occasional observations of minor CH_4 appear to result from contamination or low-temperature reactions in sample vessels. The O_2 fugacities of the gases remain near Ni-NiO during cooling. The low sulfur content of the gases obviates the need for extensive gas-rock oxygen exchange to maintain f/sub O_2/'s near Ni-NiO. A detailed thermodynamic analysis of 50 gas samples collected between September 1980 and December 1981 led to improved compositions for 22 samples. The gases were initially in a state of equilibrium, but disequilibrium modifications from atmospheric oxidation of H_2 and, to a lesser extent, CO occurred within the upper portions of the fumarole vents. The last temperatures of equilibrium for the fumarole gases range from 800°C to 650°C and are nearly always higher than the collection temperatures. No evidence was found of disequilibrium admixture of surface waters; if such modifications of the fumarole gases occurred, the water must have been added at depth and have reequilibrated with the other gas species at magmatic or near-magmatic temperatures.

16741 **Changing carbon cycle: a global analysis.** Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). 574p. (CONF-8310436—). Springer-Verlag, 175 Fifth Avenue, New York, NY 10010.

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

An attempt is made to examine current knowledge about the fluxes, sources, and sinks in the global carbon cycle as well as the ability to apply this knowledge to the prediction of changes in atmospheric CO_2 concentration resulting from anthropogenic influences. The reader will find authoritative discussions of: past and expected releases of CO_2 from fossil fuels; the historical record and implications of atmospheric CO_2 increases; isotopic and geological records of past carbon cycle processes; the role of the oceans in the global carbon cycle; the influence of the world biosphere on changes in atmospheric CO_2 levels; evidence linking the components of the global carbon cycle. This important new book will provide scientists and environmental decision makers with a major source of current information and ideas on a topic that is not only the subject of intense scientific investigation but is also relevant to key societal issues. Separate abstracts are included for 26 chapters for inclusion in the data base.

16742 **Global atmospheric CO_2 distribution 1968-1983: interpretation of the results of the NOAA/GMCC measurement program.** Gammon, R.H.; Komhyr, W.D.; Peterson, J.T. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

The modern period of precise atmospheric CO_2 measurements began with Keeling's pioneering determinations at Mauna Loa, Hawaii, and the South Pole during the International Geophysical Year. The Mauna Loa record remains the single most valuable CO_2 time series for carbon cycle model verification. For very recent interpretations of atmospheric CO_2 measurements and carbon cycle relationships. In this chapter, the global atmospheric CO_2 records, particularly of the NOAA/GMCC (National Oceanic and Atmospheric Administration/Geophysical Monitoring for Climatic Change) program, are summarized for the period 1968 through 1983, with emphasis on the mean properties of the global carbon cycle as viewed from the atmosphere (i.e., global mean CO_2 concentration, latitude dependence of concentration and seasonal amplitude, airborne fraction, etc.).

16743 **Simulating the atmospheric carbon dioxide distribution with a three-dimensional tracer model.** Heimann, M.; Keeling, C.D.; Fung, I.Y. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

The usefulness of the simulation of atmospheric CO_2 with a three-dimensional tracer model has been demonstrated by Fung et al. The present study complements these findings with the inclusion of the effects of the time-invariant fossil fuel and stationary ocean CO_2 sources. Since atmospheric transport processes change with the season, it is necessary to consider the full set of CO_2 sources and sinks, to compare model results to the available data. In particular, the authors have shown that the time-invariant sources contribute to the seasonal signal. Similarly, the seasonal CO_2 sources give rise to mean annual fields that have to be taken into account when comparing model and data. The present assessment of the seasonal cycle depends crucially on the shape and timing of the assumed vegetation function in the specification of the seasonal land biospheric CO_2 source. A significant improvement requires a more realistic vegetation function. With the help of remote sensing data from satellites, a better representation of that function may be obtained in the future. The GISS model simulation of the mean annual fields predicts a too small interhemispheric exchange. As a next possible step, they will consider the use of observed global wind fields to drive the tracer model, instead of the wind fields generated by the GISS climate model. They also note that a more detailed representation of the oceanic source/sink terms is needed to obtain a realistic mean annual CO_2 concentration field. This requires either a model of the surface layer of the ocean, which includes the effects of the marine biosphere, or a fairly complete set of observations of pCO_2 as a function of space and time in the surface waters of the oceans.

16744 **Presentation of the 20th century atmospheric CO_2 record in Smithsonian spectrographic plates.** Stokes, G.M.; Barnard, J.C. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

The history of 20th century scientific measurement programs does not contain many examples of long-running studies in which an important property of the atmosphere is reliably measured by the same person at the same site with precisions of >1%. A program that ran for a long period of time in the early and mid-20th century is the Smithsonian Solar Constant Program. Over the past several years, the authors have been studying whether a portion of the Smithsonian data set can be used to extend the record of atmospheric CO_2 concentrations back to the early 20th century. During the course of the Smithsonian Solar Constant Program, a wide variety of measurements were made; the ones of immediate interest are the spectrobolographic measurements. These observations consisted of several measurements of the transparency of the earth's atmosphere at wavelengths between 300 and 2500 nm. Within this wavelength interval are a number of absorption bands of CO_2 and, of course, the strength of these bands is a direct measure of the integrated column of CO_2 between the observer and the sun. In this chapter they will recount the efforts to use the observed strength of these bands to extract the abundance of CO_2 in the atmosphere over the course of the Smithsonian Solar Constant Program. They will discuss the following topics: The relationship between the density of an integrated column of CO_2 and surface measurements; The sources of error in a measurement of the integrated column; The details of their analysis of the Smithsonian spectrobolograms, as well as the precision of the results.

16745 **Atmospheric CO_2 record from direct chemical measurements during the 19th century.** Fraser, P.J.; Elliott, W.P.; Waterman, L.S. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

At a recent World Meteorological Organization meeting, scientists considered preindustrial measurements of atmospheric CO_2 made by direct methods such as chemical absorption, solar spectroscopy, and analysis of old air trapped in ice, as well as indirect methods involving ocean chemistry and isotopic tree-ring records. Those in attendance concluded that chemical methods indicate a range of preindustrial CO_2 concentrations from 250 to 290 ppmv, or 260 to 280 ppmv. It was suggested that the late 19th century measurements should be reassessed in the light of what is now known about the spatial and temporal variability of global atmospheric CO_2 measurements. The authors support the conclusions made at the WMO meeting. Using selection criteria designed to accept data collected during periods of maximum atmospheric mixing, a background CO_2 concentration for the northern hemisphere of 286 (+/-7) ppmv was found, based on six independent observers, or 280 (+/-12) ppmv, based on 13 different sampling locations. However, it could be argued that these concentrations represent upper limits since, in general, the data still show more variable and possibly elevated concentrations in winter, based on comparison with the modern background annual cycle.

16746 **Review of the history of atmospheric CO_2 recorded in ice cores.** Oeschger, H.; Stauffer, B. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

Since the pioneering attempts by Scholander et al. (1961), the observation that the porous spaces in natural ice contain samples of ancient air, the study of ice cores for potential insights into the history of the atmospheric CO_2 concentration has received great attention from scientists interested i the reconstruction of environmental parameters. Progress, however, was made possible only because deep ice cores from Greenland and Antarctica, which are continuous sequences of generally high-quality samples formed during the last 100,000 and 50,000 years, respectively, were available for study. Research has led to new techniques for extracting gases from ice and to recent developments of sensitive and accurate techniques for the analysis of gas. Today, analysis of gas concentrations in air entrapped in natural ice is considered to be the most promising method for reconstructing the history of the atmospheric CO_2 concentration. In this chapter, the authors describe the state of the art of this research.

16747 **Ancient carbon cycle changes derived from tree-ring ^{13}C and ^{14}C.** Stuiver, M. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

The history of the $^{13}C/^{12}C$ isotope ratio of atmospheric carbon is partly related to changes in the size of, and exchange rate between, the various terrestrial carbon reservoirs. The $^{14}C/^{13}C$ history is tied to these aspects as well. However, other major components of the ^{14}C history are the geomagnetic and solar changes that affect the flux of cosmic ray particles arriving at the earth's atmosphere. The discussions of atmospheric $^{14}C/^{13}C$ presented later include (1) long-term (10^3 to 10^4 years) change, (2) shorter-term (10 to 10^3 years) variability, an (3) the impact of fossil fuel CO_2 (which lacks ^{14}C) on atmospheric $^{13}C/^{12}C$ ratios. The $^{13}C/^{12}C$ analysis fo-

cuses on the complexities of this signal in tree rings an on a discussion of the magnitude of biospheric CO_2 release to the atmosphere.

16748 **Interpretation of the Northern Hemispheric record of $^{13}C/^{12}C$ trends of atmospheric CO_2 in tree rings.** Freyer, H.D. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

The present long-term increase of atmospheric CO_2 has been accompanied by changes in the isotopic composition of its carbon atoms. Both the ratios of stable $^{13}CO_2/^{12}CO_2$ and radioactive $^{14}CO_2/^{12}CO_2$ have decreased as a result of anthropogenic activity. The decrease of the latter, until the beginning of nuclear testing caused an increase in the mid-1950s, is almost exclusively due to dilution of atmospheric CO_2 resulting from fossil fuel burning, from which the ^{14}C isotope had already decayed. The decrease of the $^{13}C/^{12}C$ ratio is a better measure of total anthropogenic activity because if reflects not only fossil fuel burning but also CO_2 released as a result of deforestation and agricultural manipulation of the soil. The CO_2 from both of these sources is marked by a $\sigma^{13}C$ deficit of about 18 to 20 per thousand$_0$. The present $^{13}C/^{12}C$ ratio of atmospheric CO_2 is about -7.5per thousand $_0$. Measurements show that the ratio has decreased from -6.69per thousand$_0$ in 1956 to -7.34per thousand$_0$ in 1978 and to -7.46per thousand in 1980. The preindustrial ratio is not yet available; however, since carbon in wood is assimilated from atmospheric CO_2, a historical record of the ratio could be stored in tree rings. Existing measurements leave no doubt that the $^{13}C/^{12}C$ ratio in the cellulose fraction of fraction of modern wood has indeed decreased significantly. However, an uncertainty exists in the interpretation of decreasing $^{13}C/^{12}C$ tree-ring data, mainly because the atmospheric $^{13}C/^{12}C$ information is often masked by scatter which is thought to depended on local environmental and climatological factors. This chapter summarizes some of these effects and, in addition, compares all published tree-ring data for the Northern Hemisphere.

16749 **Carbon isotope measurements in baseline air, forest canopy air, and plants.** Francey, R.J. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

This chapter reviews recent experimental results from a variety of Australian programs, each having potential relevance to the direct or proxy measurement of atmospheric $^{13}C/^{12}C$ variation, in particular the global variation resulting from the combustion of isotopically light carbonaceous material in fossil fuel.

16750 **Estimating changes in the carbon content of terrestrial ecosystems.** Houghton, R.A. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

Estimates of change in the carbon content of terrestrial systems based on changes in the use of land worldwide since 1860 show a continuous net release of carbon to the atmosphere. The history of agricultural expansion is known well enough to preclude the possibility of a continuously decreasing biotic flux since 1920, although the possibility of a decreasing flux in the decades preceding 1980 cannot be ruled out. Those factors responsible for the greatest uncertainties in the time course of the net biotic release are the conversion of forests to uses other than permanent agriculture and carbon stocks, not of natural ecosystems necessarily, but of those ecosystems actually degraded or transformed to other uses. There is perhaps no better way to document changes in terrestrial ecosystems in the recent past and future than by observing them directly with remote sensing. Finally, changes can occur in the carbon content of terrestrial ecosystems not directly modified by man. Such changes could either augment or cancel the changes associated with land use. The response of natural systems to changes in climate or CO_2 are difficult to measure and difficult to predict.

16751 **One-dimensional and two-dimensional ocean models for predicting the distribution of CO_2 between the ocean and the atmosphere.** Bjoerkstroem, A. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

To assert anything about what the concentration of CO_2 in the atmosphere will be in the future requires that one understand the oceanic-atmospheric distribution of carbon and the way it may change when excess CO_2 is introduced into the atmosphere. The span of time during which the emission occurs is short compared to the slow oceanic circulation; therefore, it becomes natural to separate the mixing process into two parts: (1) the transport from the atmosphere into a thin surface layer of the ocean and (2) the exchange of water between the surface layer and deeper down. This chapter is review of the approaches that have been pursued in constructing mathematical models of the circulation of carbon between the atmosphere and the ocean.

16752 **Three-dimensional ocean models for predicting the distribution of CO_2 between the ocean and atmosphere.** Sarmiento, J. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

The author would like to emphasize three points. The first concerns the feasibility and desirability of three-dimensional ocean models for simulating CO_2 distribution. Fairly realistic three-dimensional models are already in existence and in the process of being improved. However, these models are not likely to be useful as predictors of the absolute amount of CO_2 uptake for many years. Their best use for the present is as laboratories for improving understanding of physical processes and the role of chemical and biological processes in the carbon cycle, and for testing the simpler models currently being used to make CO_2 predictions. The second point is the extent to which a three-dimensional model is likely to behave differently than simpler models. The third important point is the extent to which three-dimensional models could make better use of the available tracer data. Unfortunately, the only place where there is adequate tracer and nutrient data is in the North Atlantic because of the TTO work. In other regions, particularly around the critical deep and intermediate water formation areas of the Antarctic, information is very sparse. It is for this reason that the initial effects were concentrated in the Atlantic. Thus far, heavy use of hydrographic and tracer data in model studies has been made. Heavy use of the TTO nutrient and carbon system data in developing the model of chemical and biological processes is also being made. Data of this quality will eventually be needed from all the ocean basins if they are to expand their efforts to the world oceans.

16753 **Geologic analogs: their value and limitations in carbon dioxide research.** Sundquist, E.T. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

This chapter is a beginning attempt to constrain and quantify the relevance of geologic analogs to research on the effects of anthropogenic CO_2. The geologic record is inherently reflective of time scales longer than those usually considered in CO_2 research. However, calculated effects of natural perturbations suggest the working hypothesis that, if atmospheric CO_2 has varied by twofold or greater in the geologic past, these variations were most likely caused by processes acting over time scales of 100,000 years or longer. This hypothesis implies that the long-term resolution of the geologic record is not in itself a limitation in the study of geologic analogs of CO_2 changes comparable to those anticipated from burning fossil fuels. Geologic analogs offer not only the possibility of documenting past changes in atmospheric CO_2 but also of understanding the processes that caused them. An understanding of these long-term processes is also essential to anticipating the long-term effects of anthropogenic CO_2. The model experiment presented here

suggests that the geochemical perturbations resulting from anthropogenic CO_2 may persist for tens of thousands of years. Although such long-term projections are subject to many large uncertainties, the overriding conclusion is that significant long-term geochemical effects are possible. The chemical equilibrium relationships in the model are well established, and uncertainties in ocean mixing have diminishing importance over long time scales. Implicit in these long-term concerns is the need to look beyond the climatic effects of CO_2 during the next few decades. Although potential climatic effects have justifiably caused great concern and research interest, they must be viewed as part of a continuum of effects that may be manifested over a variety of time scales.

16754 **Requirements for a satisfactory model of the global carbon cycle and current status of modeling efforts.** Bolin, B. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

Work during the last two decades has given us a general understanding of the global carbon cycle, and we are also able to estimate its approximate response to anthropogenic emissions of CO_2 into the atmosphere. Present models, however, are inadequate for more precise projections into the future. Even though the role of the oceans is better understood than that of the terrestrial biota, considerable improvements in the modeling of all parts of the carbon cycle are essential. It is not until the response characteristics are well described on all time scales for a few years to one or two centuries that we will be possible to analyze more subtle processes, which may be quite important when projecting until the time when atmospheric CO_2 concentrations will have doubled. Detailed models are needed for comparison of what is implied by a synthesis of the present knowledge in terms of a model and the real behavior of the carbon cycle as revealed by observations.

16755 **Use of observations in calibrating and validating carbon cycle models.** Enting, E.G.; Pearman, G.I. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

The authors describe the general characteristics that are desirable in the data used for calibrating carbon cycle models. The next two sections describe how these characteristics relate to the techniques of constrained inversion that the authors used in their calibrations and the extension of this approach into the sensitivity analysis. They then include a section presenting results from a one-dimensional model and discusses the relative importance of the various model parameters and the various items of data used in the calibration. The following section extends this analysis to consider some of the types of data that they have not used either because of doubts about their applicability or because the observational programs are still in progress. By performing model calibrations using various possible data values, they can assess the extent to which such data could reduce the uncertainties in their knowledge of the global carbon cycle. Finally, they discuss some of the issues involved in the choice of data for modeling the carbon cycle with two- or three-dimensional models.

16756 **Analysis of the seasonal and geographical patterns of atmospheric CO_2 distributions with a three-dimensional tracer model.** Fung, I.Y. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

Initial attempts to model atmospheric CO_2 distribution (with the ocean and biosphere as seasonal sources and sinks) encourage the notion that this approach will lead to useful quantitative constraints on CO_2 fluxes and changes in these fluxes. Realization of this objective will require: 1. Continued improvement in the realism of 3-D global transport modeling. 2. Information about the geographical distribution and seasonal variations of marine biota, total alkalinity, and total carbon concentrations in the surface waters. 3. Realistic models of the seasonal behavior of terrestrial biota that are based on knowledge of the behavior of the biota rather than derived by simple transport models. 4. Extended timelines of atmospheric CO_2 monitoring, with improved precision and definition of the uncertainties in the measured CO_2 amounts. Many of the potential applications depend on measurement of perturbations of the CO_2 distributions and changes in time or in geographical distribution. Consequently, accurate calibration and intercalibration among different observing stations is important.

16757 **Fossil fuel combustion: recent amounts, patterns, and trends in CO_2.** Rotty, R.M.; Marland, G. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

Several types of human activity introduced perturbations that impinge on the natural global carbon cycle. During the past century of so, one of the major perturbations has been the release of carbon from long-term storage through the combustion of fossil fuels. During the next 100 years fossil fuel use will almost certainly be the major source causing increased levels of CO_2 in the atmosphere. Fossil fuel combustion now releases CO_2 at the rate of 5 gigatons of carbon per year. The annual emissions from fossil fuel combustion during the period following World War II grew exponentially at a near constant value of 4.5% per year until 1973. Since then the global growth rate has been <2% per year. The annual rate of emission of CO_2 from fossil fuel combustion is generally conceded to be one of the better known facts about the CO_2 problem. Only the increase in the amount of CO_2 in the atmosphere during the past 25 years can be documented with greater confidence. Because the fossil fuel recoverable resources are so vast, it is very difficult to foresee any world scenario that denies continuing use of very large amounts of fossil fuels. As a consequence, the annual emissions are likely to continue to grow and become even more central to any developing CO_2 problem.

16758 **Possible changes in future use of fossil fuels to limit environmental effects.** Perry, A.M. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

The role of the other greenhouse gases in altering future climate, and especially their future concentrations in the atmosphere, are at this stage subject to very large uncertainties. The conclusions that a greenhouse warming of a few degrees Celsius is inevitable and that cutting back on CO_2 emissions from fossil fuels would not help much, therefore, seem to be somewhat premature. However, the analysis does point up dramatically the need to get a much better understanding of the potential effect of the other greenhouse gases as well as that of CO_2. It may well be that restrictions on fossil fuel use would not be very effective in limiting future climate change unless simultaneous measures were taken to restrict emissions of other anthropogenic greenhouse gases.

16759 **Effects of dynamic heat fluxes on model climate sensitivity: meridional sensible and latent heat fluxes.** Gutowski, W.J. Jr.; Wang, W.C. (Atmospheric and Environmental Research Inc., Cambridge, MA). *Journal of Geophysical Research;* **90**: No. D7, 13,081-13,086(20 Dec 1985). Contract AC02-81ER60023.

The authors incorporate physically based parameterizations of atmospheric meridional heat fluxes into the climate model of Wang et al. (1984) to study their effects on climate changes caused by increases of CO_2 abundance and solar constant variations. The physically based parameterizations calculate both the magnitudes and profiles of the sensible and latent heat fluxes in good agreement with observations. Comparisons of climate sensitivity between the physically based parameterizations and the original model's empirical parameterization for total transport are performed. The results indicate that both parameterizations yield about the same changes in global mean surface temperature and ice line, but the physically based parameterizations produce smaller changes in meridional temperature gradient. Also, the sensible and latent heat fluxes from the

physical parameterization produce mutually compensating changes which are consistent with general circulation model results. They also study the separate feedback effects of sensible and latent heat fluxes by allowing only one or the other to change during climate changes. It is found that these variations in the partitioning of changes in the meridional heat transport have relatively small effects on the change of hemispheric mean surface temperature, but they can affect both the sign as well as the magnitude of the change of meridional temperature gradient. The change in total meridional heat transport is also relatively insensitive to the partitioning variations. Further analysis of the mode's energy balance indicates that this insensitivity is a consequence of two features of the results: (1) absorption of the latitudinally varying part of the solar heating is affected very little by the partitioning, and (2) thermal structure changes that are affected by the partitioning do not influence greatly the zonal energy balance.

16760 **Model study of the greenhouse effects due to increasing atmospheric CH_4, N_2O, CF_2Cl_2, and $CFCl_3$.** Wang, W.C.; Molnar, G. (Atmospheric and Environmental Research, Inc., Cambridge, MA). *Journal of Geophysical Research;* 90: No. D7, 12,971-12,980(20 Dec 1985). Contract AC02-81ER60023.

The authors use the two-dimensional (altitude-latitude) radiative-dynamical model of Wang et al. (1984) to investigate the effects on vertical and meridional temperatures of increases of atmospheric methane, nitrous oxide, and chlorofluorocarbons. The model couples are the meridional and vertical temperature structure through energy balance between radiative flux and vertical and meridional heat transports. They show that the thermal radiation flux perturbations, i.e., the driving force for the subsequent climate change, caused by increases of these trace gases and carbon dioxide, are different in nature. The two-dimensional model simulates much more realistic temperature and humidity distributions than does a one-dimensional model. For a doubling of the atmospheric CO_2 concentration of 330 parts per million by volume, the two-dimensional model computes a global surface warming of 3.7 K with larger high-latitude amplification, which is in good agreement with results obtained from general circulation models. For the study of the surface warming due to increases of trace gases, it is found that the one-dimensional model using a 6.5 K km^{-1} critical lapse rate for convective adjustment appears to calculate a much larger surface warming than the two-dimensional model. On the other hand, the one-dimensional model using the moist adiabatic critical lapse rate, although it can not simulate adequately the present tropospheric temperature structure, calculates surface warming effects in close agreement with those of two-dimensional model results. Although the calculations depend largely on the adopted scenarios for future increases, the results from the two-dimensional model nevertheless reveal that, on the time scale of decades, the trace gases could potentially augment the surface warming due to carbon dioxide increase by more than 60%.

16761 **Analytical solution for the effect of increasing CO_2 on global mean temperature.** Wigley, T.M.L.; Schlesinger, M.E. (Univ. of East Anglia, Norwich, England). *Nature (London);* 315: No. 6021, 649-652(20 Jun 1985). Contract AC02-79EV10098.

Oceanic thermal inertia effects can significantly slow the response of the climate system to external forcing. The main controlling parameters are the effective diffusivity of the ocean below the upper mixed layer (k) and the climate sensitivity (defined by ΔT/ sub 2x/). Here they present a more general analysis of two cases, forcing by a step function change in CO_2 concentration and by a steady CO_2 increase. The former case may be characterized by a response time which they show is strongly dependent on both k and ΔT/sub 2x/. In the latter case the damped response means that, at any given time, the climate system may be quite far removed from its equilibrium with the prevailing CO_2 level. The observed global warming over the past 100 years can be shown to be compatible with a wide range of CO_2-doubling temperature changes.

16762 **Global atmospheric CO_2 distribution and variations from 1968-1982 NOAA/GMCC CO_2 flask sample data.** Komhyr, W.D.; Gammon, R.H.; Harris, T.B.; Waterman, L.S.; Conway, T.J.; Taylor, W.R.; Thoning, K.W. (NOAA Air Resources Lab., Boulder, CO). *Journal of Geophysical Research;* 90: No. D3, 5567-5596(20 Jun 1985).

CO_2 data obtained from discrete sampling during 1968-1982 at 23 National Oceanic and Atmospheric Administration/Geophysical Monitoring for Climatic Change and foreign cooperative stations are presented, together with a description of the measurement program and data quality. Monthly, seasonal, and annual CO_2 concentrations are determined by the individual stations from select (background) data. Temporal and spatial global CO_2 distributions yield annual and seasonal latitudinal gradients, abundances, airborne fractions, annual cycle amplitudes and phases, annual cycle amplitude growth rates, and global growth rate variations of CO_2. The time-series data sets reveal variations related to several El Nino/ Southern Oscillation events, particularly with respect to the strength of the CO_2 source in the equatorial Pacific Ocean and global CO_2 growth rates. CO_2 growth rate anomalies correlate highly with the Southern Oscillation Index, which is related to the strength of the easterly trade winds that blow along the equator. 54 references, 17 figures, 12 tables.

16763 **Modeling needs for predicting responses to CO_2 enrichment: plants, communities and ecosystems.** Dahlman, R.C. (Dept. of Energy, Washington, DC). *Ecological Modelling;* 29: 77-106(1985).

Carbon dioxide enhancement of plant growth is an important direct effect of rising atmospheric CO_2. New or modified modeling approaches are needed to understand and predict responses of native species and ecosystems to CO_2 enrichment. As atmospheric CO_2 doubles within the next 100 years, validated models will be important tools for predicting responses such as changed productivity, altered composition of plant communities, and changes in amounts of sequestered carbon. Needs for modeling plant and ecosystem responses are discussed as part of a comprehensive plan for research of direct effects of CO_2 on vegetation. Primary needs are: (a) a level of model complexity commensurate with general ecological knowledge, one which treats principal CO_2 response functions; (b) the development of models for predicting plant, community and ecosystem responses to CO_2, (c) an evaluation of sensitivity and uncertainty of CO_2-dependent model parameters; and (d) validation of model predictions. A secondary need is to establish a framework for evaluating data requirements for models. 48 references, 8 figures, 2 tables.

16764 **Predicting the response of plants to increasing carbon dioxide: a critique of plant growth models.** Reynolds, J.F.; Acock, B. (North Carolina State Univ., Raleigh). *Ecological Modelling;* 29: 107-129(1985). Contract AI01-81ER60001.

It is widely recognized that increasing global carbon dioxide concentration in the atmosphere may alter the growth of plants. This has lead to speculation about the long-term impact of rising CO_2 on agricultural productivity and on natural ecosystems, e.g., shifts in native species distributions and sequestering of carbon in forests. In this paper they critique some existing plant growth models with regard to their potential for predicting and evaluation possible scenarios of vegetation response to elevated CO_2 levels. To facilitate this, they present various criteria for model evaluation, specify a minimum set of plant processes that should be considered for inclusion in a generic model capable of predicting plant response to CO_2, survey numerous published plant growth models with respect to these criteria, and propose a scheme for identifying the various options available for modeling the response of vegetation to CO_2.

16765 **Land use change and carbon exchange in the tropics. I. Detailed estimates for Costa Rica, Panama, Peru, and Bolivia.** Hall, C.A.S.; Detwiler, R.P.; Bogdonoff, P.; Underhill, S. (Cornell Univ., Ithaca, NY). *Environmental Management;* 9: No. 4, 313-334(1985).

This group, composed of modelers working in conjunction with tropical ecologists, has produced a simulation model that

quantifies the net carbon exchange between tropical vegetation and the atmosphere due to land use change. The model calculates this net exchange by combining estimates of land use change with several estimates of the carbon stored in tropical vegetation and general assumptions about the fate of cleared vegetation. In this report, the authors use estimates of land use and carbon of land use and carbon storage organized into six life zone (sensu Holdridge) categories to calculate the exchange between the atmosphere and the vegetation of four tropical countries. Their analyses of these countries indicate that this life zone approach has several advantages because (a) the carbon content of vegetation varies significantly among life zones, (b) much of the land use change occurs in life zones of only moderate carbon storage, and (c) the fate of cleared vegetation varies among life zones. Their analyses also emphasize the importance of distinguishing between temporary and permanent land use change, as the recovery of vegetation on abandoned areas decreases the net release of carbon due to clearing. They include sensitivity analysis of those factors that they found to be important but are difficult to quantify at present.

16766 **Atmospheric CO/sub 2/ variations based on the tree-ring 13/sub C/ record.** Peng, T.H. (Environmental Sciences Div., Oak Ridge National Lab., Oak Ridge, TN 37831). pp 123-131 of The carbon cycle and atmospheric CO/sub 2/: Natural variations Archean to present. Sundquist, E.T.; Broecker, W.S. Washington, DC; American Geophysical Union (1985). (CONF-840181—).

From American Geophysical Union Monography meeting on carbon dioxide through geologic time; Tarpon Spring, FL, USA (15 Jan 1984).

The reconstruction of atmospheric CO/sub 2/ concentrations over the last 150 years, based on a deconvolution of the tree-ring-based /sup 13/C record, is reviewed. Assuming that Freyer's latest composite /sup 13/C record for the northern hemisphere represents global changes in the /sup 13/C//sup 12/C ratio of atmospheric CO/sub 2/ induced by changes in atmospheric CO/sub 2/ concentration due to deforestation, soil manipulation, and combustion of fossil fuels, the deconvolution, using the modified box-diffusion model, gives the following results: (1) the magnitude of the integrated CO/sub 2/ release from the terrestrial biosphere since 1800 is about 90% of that from fossil fuel; (2) over the two-decade period covered by the Mauna Loa atmospheric CO/sub 2/ record, the input from the forest-soil source is about 15% of that from fossil fuels; (3) the /sup 13/C//sup 12/C trend and the atmospheric CO/sub 2/ anomaly over the last two decades have been dominated by the input of fossil fuel CO/sub 2/; and (4) the pre-1850 atmospheric CO/sub 2/ content is estimated to be about 266 ppm. The integrated amount of CO/sub 2/ released from the terrestrial biosphere between A.D. 1800 and 1980 is estimated to be 12 x 10/sup 15/ mol which is to be compared with the previous estimate of 22 x 10/sup 15/ mol on the basis of Freyer and Belacy's (1983) /sup 13/C data. This indicates that tree-ring /sup 13/C-based estimates are volatile and further changes are likely.

16767 **Core processing and first analysis of ice cores from Siple and South Pole stations.** Stauffer, B.; Schwander, J. (Univ. of Bern, Switzerland). *Antarctic Journal of the United States;* **19**: No. 5, 59-61(1984).

Analysis of ice cores from the Antarctic allows the authors to study the history of climatic parameters such as temperature, annual accumulation, and atmospheric composition. The main goal of their laboratory analysis of these of these ice cores is to investigate the preindustrial atmospheric carbon dioxide concentration and its natural variations and to measure the carbon-13/carbon-12 ratio in the preindustrial carbon dioxide and in other atmospheric trace gases such as methane. The cores drilled during 1983-1984 field season at the South Pole will be analyzed during the coming year. Several analyses have been made, however, on such cores drilled in the previous field seasons: the analysis of the carbon dioxide concentration of air extracted from ice cores indicates that the preindustrial atmospheric carbon dioxide concentration was about 280 parts per million by volume as compared to present levels of about 340 parts per million. There is some evidence that this value is more accurate than the lower value reported earlier by a laboratory in Grenoble and by their laboratory. They also measured the carbon-13/carbon-12 ratios of carbon dioxide and of the methane concentration. These results are still preliminary and will be reported later.

16768 **(GSF—16/86) Environmental radioactivity and radiation exposure in southern Bavaria after the Chernobyl accident.** (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Inst. fuer Strahlenschutz). 15 Jun 1986. 40p. (In German). NTIS (US Sales Only), PC A03/MF A01. File Number DE87750509.

Since April 30, 1986, comprehensive nuclide-specific measurements have been carried out in air, precipitations, soil, grass, and food in order to determine the fission product activity as a result of the Chernobyl accident. The increase in the gamma dose rate induced by the fission product fallout has been measured primarily in Bavaria. Some important results of the measurements so far are listed in the report. Based on these data, a preliminary assessment is made of the longterm radiation dose to the population in the region of southern Bavaria. The assessment takes into account the dose commitment emanating from external beta and gamma radiation, from intake with food, and by inhalation of fission products.

16769 **Field evaluation of an emergency response atmospheric dispersion model.** Weber, A.H.; Kurzeja, R.J.; Addis, R.P.; Milham, R.C. (Savannah River Lab., Aiken, SC). *Transactions of the American Nuclear Society;* **53**: 70-71(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

An important consideration in planning emergency response operations is the validity of the atmospheric dispersion models used to characterize and predict the path of a radionuclide or chemically hazardous atmospheric release. For the past several years, the Savannah River Laboratory (SRL) has performed field experiments to evaluate the emergency response code PUFF-PLUME, which is used at the Savannah River Plant (SRP) site. Results from an extensive series of daytime experiments are presented, along with preliminary results from a pair of recent nighttime experiments.

16772 **Design and use of climatological data banks, with emphasis on the preparation and homogenization of surface monthly records.** Palutikof, J.P.; Goodess, C.M. (Univ. of East Anglia, Norwich, England). *Climatic Change;* 9: 129-147(1986). Contract AC02-79EV10098;AC02-81EV10739.

The procedures involved in constructing data banks for use in climatological research are described. Such data banks will normally have two component parts: the meteorological records themselves, and the accompanying documentary and information systems. As a first step, meteorological records appropriate for the intended application of the data bank must be collected and stored, commonly in a computer. Individual records must then be merged into a form convenient for the user. Procedures for quality control of the data are discussed. The authors emphasize the need to ensure that records are homogeneous, i.e., that they do not contain spurious jumps or trends caused by non-climatic factor such as site change or urbanization. Some techniques to correct inhomogeneities in meteorological records are described. The documentation accompanying the meteorological records has three components: first, information on the individual records, second, a list of data sources, third, station histories. The station histories will be added to as work progresses on the data bank, to describe any attempts to homogenize records, and ultimately to give the compiler's assessment of the reliability of each record. User needs must be considered at all stages of data bank design and construction.

16773 **(CONF-8608141—1) Radiodensitometric tree-ring analysis along altitudinal gradients: Some alternative procedures for detecting site, climatic, and potential CO_2 effects on tree growth.** Kienast, F. (Oak Ridge National Lab., TN (USA)). 1986. Contract AC05-84OR21400. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87002412.

From Industrial symposium on ecological aspects of tree ring analysis; Terrytown, NY, USA (17 Aug 1986).

Relationships among weather conditions, site elevations, site characteristics, and ring formation on trees growing along altitudinal transects were investigated. Thirty-four chronologies from four different climatic regions with a wide range of site conditions were analyzed with radiodensitometric methods. A graphical technique of data representation was developed to analyze the tree-ring pattern on a single-year basis. Typical examples are presented and the dynamics of the overlapping environmental influences are discussed. The broad spectrum of site conditions was used to identify ring parameters and site types most suitable for reconstruction of temperature or precipitation records. Additionally, the transects served as an ideal data base to test the theory of a possible growth enhancement caused by increased atmospheric carbon dioxide. Results show a growth increase (mainly in the ring widths) in about 25% of all chronologies during the last three decades. In most of the cases the increase is related to a specific site type, influenced only slightly by climatic stress. Sensitive chronologies with heavy climatic stress and complacent series did not show the increase. However, more favorable climatic conditions were found to coincide with this increase in more than 60% of all the chronologies that showed increased growth. Extrinsic factors such as higher CO_2 levels, could have contributed to an increase in only 10 to 15%, at the most, of the 34 chronologies.

16774 **(NP—7750865) Studies on heavy metals in household refuse and on heavy metals concentration in certain fractions or groups of materials by suitable treatment.** Bidlingmaier, W.; Kranert, M.; Schweizer, W. (Arbeitskreis fuer die Nutzbarmachung von Siedlungsabfaellen e.V. (ANS), Wiesbaden (Germany, F.R.)). May 1984. 91p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE87750865.

The following tasks were to be carried out: Determination of the total heavy metal concentration in domestic refuse; development of an adequate sampling system; measurement of heavy metal concentrations in different groups of materials in order to determine their origins and determination of heavy metal concentrations in different screen fractions. The second step was an investigation into the possible ways of applying the findings for the purpose of minimizing heavy metal concentrations in a waste disposal system. The possibility of concentrating heavy metals in certain groups of materials or screen fractions is investigated.

16775 **(NP—7751302) Forms in which aluminium is bound and equilibria of aluminium in gravitational water in acid soils.** Dietze, G. (Goettingen Univ. (Germany, F.R.). Forschungszentrum Waldoekosysteme - Waldsterben). 1985. 62p. (In German). NTIS (US Sales Only), PC A04/MF A01. File Number DE87751302.

For closer characterization of the specific forms of aluminium occurring in the gravitational water of acidified forest soils, especially those bound to organic constituents, a concept of methods was worked out permitting to differentiate between the forms of aluminium as regards their ecologic importance. A spruce stand in the Solling forest was selected as a site where the concept was to be applied. Humus funnel solutions obtained in situ and water extracts, prepared at the laboratory, of the soil layer covering the humus were investigated and compared. A joint consideration of all the results permits the conclusion that aluminium, under the site conditions given, is present predominantly in organic compound form. This form can by all means be considered stable in terms of thermodynamics; yet, with kinetic regards, it proves to be an extremely labile to moderately labile form. In this connection the medium-to high-molecular organic constituents of gravitational water are of special significance.

16776 **(PB—87-112413/XAB) Protection of ground water by immobilization of heavy metals in industrial-waste-impacted soil systems.** McLean, J.E.; Dudley, L.M.; Sims, R.C. (Utah State Univ., Logan (USA). Utah Water Research Lab.). Sep 1986. 77p. NTIS, PC A05/MF A01.

Immobilization processes in soil/waste systems impacted by hazardous wastes containing heavy metals were investigated. Samples of contaminated material (soil and/or waste) from nine sites in the Intermountain West and California included milling, electroplating, cement kiln dust, petroleum, and tailing and waste rock from mining operations. A sequential extraction procedure, originally developed to fractionate metals in sludge-amended soils into water soluble, mobile, and plant-available forms, was used to obtain preliminary identification of the leachable-metal fraction for the hazardous-waste-contaminated soils studied. Sorption kinetics and batch sorption/desorption studies were performed to determine the interaction of Cu and Cd, from an acidic leachate of a mine waste, with calcareous soils. Solid phase diagrams, exchange models, and GEOCHEM were used to define the mechanisms of metal attenuation of these soils.

16777 **(PNL—5750-Pt.5, pp 41) Effluent monitoring systems at Department of energy facilities.** Unruh, C.M. Feb 1986. NTIS, PC A04/MF A01. File Number DE86011909.

In Pacific Northwest Laboratory annual report for 1985 to the DOE Office of the Assistant Secretary for Environment, Safety and Health. Part 5. Overview and assessment.

The purpose of this task is to: (1) evaluate the system design, procedures, and performance of Department of Energy effluent monitoring for both routine and accidental releases; (2) identify significant deficiencies or problem areas; (3) provide technical assistance as requested; (4) verify performance of selected systems by direct independent measurements (to be accomplished by a subcon-

tract to EG & G-Idaho); and (5) provide a mechanism to facilitate exchange of information between facilities.

16778 **Changes in soil carbon storage and associated properties with disturbance and recovery.** Schlesinger, W.H. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

The main finding of this chapter is that the loss of carbon from soil profiles on cultivation is about 30% over a 20- to 50-year interval. This value is lower than parameters used in most recent models of anthropogenic changes in the global carbon cycle. Lower values result when field data are expressed in terms of the change in soil carbon storage, rather than the change in the percent organic carbon in soil samples, because losses of carbon are associated with increases in soil bulk density. Losses in the surface layers are often > 30%, but a large amount of soil carbon occurs in the lower portion of the profile and shows little change. More field work is needed in areas of organic soils and in tropical savanna and arid ecosystems. The pattern of loss of soil carbon on land-use conversion suggests that the soil organic matter can be divided into two fractions: labile and refractory. Changes in ^{14}C age and the C:N ratio with cultivation are consistent with the loss of the more labile fractions comprised of recent plant residues. The major loss of soil carbon occurs in the first 20 years after land-use conversion, and is associated with an increased release of CO_2 from soils to the atmosphere. This rapid decline in soil organic matter should be relatively easy to simulate in bookkeeping models of terrestrial carbon storage.

16779 **Continental and global scale remote sensing of land cover.** Tucker, C.J; Townshend, J.R.G.; Goff, T.E.; Holben, B.N. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

Satellite remote sensing of land cover at regional, continental, and global scales is possible using NOAA-satellite AVHRR data. The daily acquisition of imagery for the entire planetary surface provides the means to overcome cloud cover, atmospheric effects, and other degrading influences while recording the aggregated response of green leaf biomass at scales of 1 km and larger. One-kilometer data have been used to identify areas of tropical deforestation, while remapped and sampled 4-km data have been used to classify the land cover of Africa and document the seasonal dynamics of global green leaf biomass. These data provide the means for monitoring the terrestrial biota and advancing understanding of the role of the terrestrial biota in the carbon cycle.

16780 **Changes in the area of forests in Rondonia, Amazon Basin, measured by satellite imagery.** Woodwell, G.M.; Houghton, R.A.; Stone, T.A.; Park, A.B. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

Rates and areas of deforestation can be determined from both LANDSAT and NOAA7 satellite data. Information from the analysis of satellite data can be used to lessen current uncertainty about rates of deforestation in tropical forests. LANDSAT data tapes from three different years were used to determine the amount of forest cleared in one LANDSAT scene in the Brazilian Amazon Basin state of Rondonia. Rates of deforestation in the area of the LANDSAT scene (34,000 km_2) doubled over the 1976 to 1981 period examined. Rates of deforestation can be determined using a 5-year interval; this interval is too long to determine accurately other types of transformations such as nonforest to agriculture or pasture. No nonforest-to-forest transformation was found in Rondonia, presumably because all areas cleared are kept either in pasture or crops and are not allowed to return to forest. With data from LANDSAT an NOAA7 the authors have determined that at least 11,400 km^2 of Rondonia has been deforested up to 1982. This estimate tends to confirm the higher estimates from other sources. The amount of carbon lost to the atmosphere due to forest clearing within the area of the Rondonia LANDSAT scene was determined using a regional version of the MBL/TCM, with clearing rates determined from the LANDSAT change-detection analysis. Between 3.9×10^{12} and 5.5×10^{12} g C were released in 1981.

16781 **The combined effects of atmospheric deposition, internal acid production, and harvesting on nutrient gains and losses from forest ecosystems.** Johnson, D.W.; Richter, D.D. (Sciences Div., Oak Ridge National Lab., P.O. Box X, Oak Ridge, TN 37831). pp 149-156 of Proceedings of the 1984 research and development conference. Atlanta, GA; Tappi Press (1984). (CONF-8409153—). Contract AC05-84OR21400.

From TAPPI research and development conference; Appleton, WI, USA (30 Sep 1984).

Atmospheric deposition can cause nutrient gains (N, S) or losses (Ca, Mg, K) from forest ecosystems whereas harvesting causes only losses. Available data indicate that S deposition in polluted regions greatly exceeds S export via whole-tree harvesting, but this is not normally the case for N. Both atmospheric acid deposition (in concert with internal acid production) and harvesting can cause the loss of base cations, but because of tree selectivity in cation uptake, it appears that harvesting will have a greater impact on the export of scarce or limiting cations than will acid deposition or internal acid generation. However, nutrient losses via harvesting can be minimized by timing harvests and losses can be compensated for by proper fertilization under intensive management regimes.

16782 **(ORNL/ESH—1/V24) Resource management plan for the Oak Ridge Reservation: Volume 24, Threatened and endangered animal species.** Kroodsma, R.L. (Oak Ridge National Lab., TN (USA)). Jan 1987. Contract AC05-84OR21400. 24p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87005283.

United States and Tennessee laws provide protection for wildlife species that the US Fish and Wildlife Service (FWS) and the Tennessee Wildlife Resources Agency (TWRA) have determined to be endangered or threatened. These laws and their implications for management of the Oak Ridge Reservation (ORR) are briefly discussed. The historical occurrence, current status, and recommended surveys and management plans for all threatened and endangered (T and E) wildlife species with a reasonable probability of occurring on the ORR are also discussed. Seventeen species of T and E mollusks historically occurred in the Oak Ridge area, but no management action is recommended because reservoir construction and other factors not related to Department of Energy operations have eliminated suitable habitat. Systematic surveys and management actions are also not recommended for three species of T and E fish, one amphibian species, one reptile species, six bird species, and two mammal species because of the very low potential for the occurrence of these species on the ORR. For three T and E bird species on the ORR, no feasible or significantly beneficial management actions could be identified. Surveys and consideration of possible management actions are recommended for three state-listed bird species that occur on or near the ORR and for two federally listed bat species that occur in East Tennessee and may occur on the ORR.

16783 **(PB—87-112439/XAB) Design of a drinking-water-quality monitoring program.** Godfrey, P.J.; Ruby, A.; Zajicek, O.T.; DeFrancesco, S.J.; Sutherland, M. (Massachusetts Univ., Amherst (USA). Water Resources Research Center). Aug 1986. 123p. (PUB—154). NTIS, PC A06/MF A01.

The report reviews literature on the impacts of acid deposition and the effect of acidic water on drinking-water quality: it reveals that the majority of surface water supplies in Massachusetts are vulnerable to acidification, that surface-water supplies have experienced historical losses of acid-neutralizing capacity, and that the primary potential cause of acidification-related water-quality degradation of household drinking water is the corrosion of water supply distribution pipes.

16784 **Calibrating ocean models by the constrained inverse method.** Moore, B. III; Bjoerkstroem, A. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

To understand more thoroughly the global carbon cycle as a whole and the oceanic sink in particular, it is increasingly evident that the heterogeneity of the various components must be considered. Oceanic models whose components represent actual oceanic regions are clearly necessary. This will require methodologies that are appropriate for systems with hundreds of boxes as well as techniques to extract consistent information from diverse global data sets. The existence of data and the use of data are fundamental to future progress; higher-resolution oceanic models must be built upon extensive sets of consistent oceanographic data. There are no shortcuts possible with regard to the requirement of data. It would appear that the methodology of constrained inversion that the authors have presented is particularly well-suited to develop the spatially detailed global ocean models through logical exploitation of the important information contained in GEOSECS and Levitus (1982), the developing data set that TTO hopefully will provide, and region-specific oceanic data sets that exist around the world. Such geographically detailed ocean models should allow more accurate estimates of the ocean uptake of fossil fuel CO_2 over the last 100 years and, hence, indirectly an independent estimate of net exchange of CO_2 between the atmosphere and the biosphere. Obviously, such estimates are important benchmarks in their understanding of the carbon cycle generally and, hence, part of the foundation for any predictions about the future.

16785 **Measurements of total carbon dioxide and alkalinity in the North Atlantic Ocean in 1981.** Brewer, P.G.; Bradshaw, A.L.; Williams, R.T. pp vp of Changing carbon cycle: a global analysis. Trabalka, J.R.; Reichle, D.E. (eds.). New York, NY; Springer-Verlag (1986). (CONF-8310436—).

From 6. annual ORNL life science symposium; Knoxville, TN, USA (31 Oct 1983).

The ocean uptake of fossil fuel CO_2 has long been recognized as the principal modulator of the rising atmospheric CO_2 level. If the authors are to observe and understand this effect, then an essential step is the accurate measurement of the CO_2 properties of the ocean. Historically this has been quite difficult to achieve. Although measurements of some kind date back to the late 19th century, complete, documented, and verifiable measurements are scarce indeed. This chapter describes and documents the series of total CO_2 and alkalinity measurements of seawater made on the North Atlantic Ocean during the Transient Tracers in the Ocean (TTO) expedition in 1981, and presents briefly the signals these data reveal.

16786 **Organic storage of CO_2 on the continental slope off the mid-Atlantic bight, the southeastern Bering Sea, and the Peru coast.** Walsh, J.J.; Premuzic, E.T.; Gaffney, J.S.; Rowe, G.T.; Harbottle, G.; Stoenner, R.W.; Balsam, W.L.; Betzer, P.R.; Macko, S.A. (Univ. of South Florida, St. Petersburg). *Deep-Sea Research, Part A: Oceanographic Research Papers;* 32: No. 7, 853-883(1985). Contract AC02-76CH00016.

A comparison is made of organic content, sedimentation rates derived from ^{14}C and ^{210}Pb analyses, ^{13}C and ^{15}N isotope ratios, amorphous silica, particle size, and calcium carbonate within sediments from slopes off the mid-Atlantic bight, the southeastern Bering Sea, and the Peru coast. These sediments are mainly marine, diatom-rich, and about one-third of the organic carbon is recent, reflecting a possible transient of shelf export in response to man's increased activities since the industrial revolution. Using a combination of sedimentation and mixing rates of carbon, the C:N ratio of sediments within the upper 50 cm, and the amount of nitrogen thought to be released from the coastal zone, independent estimates suggest a carbon loading to world slopes of ~ 0.3 to 0.5×10^9 tons C y^{-1}. The Bering slope exhibits no anthropogenic transients, however, while increased carbon loading may have occurred off Peru in response to overfishing and off the mid-Atlantic bight in response to eutrophication. The generality of their results depends on which of the three systems is most representative of world slopes.

16787 **Preliminary observations of oxygen and carbon dioxide of the wintertime Bering Sea marginal ice zone.** Chen, C.T.A. (Oregon State Univ., Corvallis). *Continental Shelf Research;* 4: No. 4, 465-483(1985). Contract AC05-84OR21400.

Wintertime oxygen and pH profiles across the marginal ice zone of the central and southeastern Bering Sea shelf are analyzed and compared with summer data. During the winter, at water depths shallower than 75 m, the water column is homogeneous and near freezing. Between the 75- and 200-m isobaths the structure is essentially two-layered, a cool and fresh upper layer overlying a warmer, more saline bottom layer. The oxygen concentration in the surface mixed layer is higher than the summer values, but the degree of saturation is lower because of the lower temperature in winter. The oxygen degree of saturation in the bottom mixed layer on the shelf in winter are higher than in the surface water in winter and the bottom water in summer. In summer the oxygen and carbon dioxide data show extreme variability governed primarily by biological processes. Winter oxygen and pH data, however, do not scatter as much as the summer data and indicate conservative mixing of several sub-surface water masses. The surface water is undersaturated in both oxygen and carbon dioxide and seems to absorb oxygen, but little carbon dioxide, from the atmosphere. Two stations were occupied in the Aleutian Basin. The homogeneous surface layer has the same oxygen and pH values as in the minimum temperature layer observed in the summer by other investigators at the same location. The result substantiates the hypothesis of early investigators that the summer minimum temperature layer is the remnant local winter water. All winter surface waters sampled are undersaturated with respect to oxygen, suggesting that the input of oxygen through the air-sea exchange does not keep up with the rate of upwelling and cooling, which reduces the degree of oxygen saturation. Surface carbon dioxide is also undersaturated because of cooling. 53 references, 12 figures.

16788 **Excess carbon dioxide in the Weddell Sea.** Chen, C.T.A.; Poisson, A. (Oregon State Univ., Corvallis). *Antarctic Journal of the United States;* 74-75(1984).

The authors recently suggested that the antarctic bottom water (AABW) contains little or no excess carbon dioxide because, as is well known, AABW was largely blocked from the air by ice when formed. The conclusion was uncertain, however, because the excess carbon dioxide results which were based on the GEOSECS

(Geochemical Ocean Section Studies) and IGY (International Geophysical Year) data had a large scatter about the oxygen value masking possible small trends of increased near-bottom excess carbon dioxide. To confirm their previous results, they participated in the US - USSR. Weddell Polynya Expedition on the Soviet research vessel/icebreaker Somov between 9 October and 25 November 1981. The more precise Somov data indicated that AABW indeed contains only 6 +/- 5 micromoles per kilogram of excess carbon dioxide. The pre-industrial carbon dioxide concentration in the atmosphere was estimated to be 268 +/- 13 microatmospheres.

16789 **Gas exchange measurements in natural systems.** Broecker, W.C.; Peng, T.H. (Columbia Univ., Palisades, NY). pp 479-493 of Gas transfer at water surfaces. Brutsaert, W.; Jirka, G.H. (eds.). Amsterdam, Netherlands; D. Reidel Publishing Company (1984).

Our direct knowledge of the rates of gas exchange in lakes and the ocean is based almost entirely on measurements of the isotopes ^{14}C, ^{222}Rn and ^{3}He. The distribution of natural radiocarbon has yielded the average rate of CO_2 exchange for the ocean and for several closed basin lakes. That of bomb produced radiocarbon has been used in the same systems. The ^{222}Ra to ^{226}Ra ratio in open ocean surface water has been used to give local short term gas exchange rates. The radon method generally cannot be used in lakes, rivers, estuaries or shelf areas because of the input of radon from sediments. A few attempts have been made to use the excess ^{3}He produced by decay of bomb produced tritium in lakes to give gas transfer rates. The uncertainty in the molecular diffusivity of helium and in the diffusivity dependence of the rate of gas transfer holds back the application of this method. A few attempts have been made to enrich the surface water of small lakes with ^{226}Ra and ^{3}H in order to allow the use of the ^{222}Rn and ^{3}He methods. While these studies give broadly concordant results, many questions remain unanswered. The wind velocity dependence of gas exchange rate on molecular diffusivity also remains in limbo. Finally, the degree of enhancement of CO_2 exchange through chemical reactions has been only partially explored. These remaining uncertainties have relevance to some of the key applications of our knowledge regarding gas exchange rates to environmental problems.

16790 **Carbonate chemistry during WEPOLEX-81.** Chen, C.T.A. (Oregon State Univ., Corvallis). *Antarctic Journal of the United States;* 102-103(1982).

As part of the US-USSR Weddell Polynya expedition (WEPOLEX-81), the author and Soviet counterparts measured acidity and alkalinity of seawater samples on board the ship. Library seawater samples were collected for later measurements of total carbon dioxide (CO_2) and partial pressures of CO_2 and for density and calcium. Some melted ice samples also were collected for measurements of conductivity, chlorinity, density, calcium, and alkalinity. The objectives are (1) to use the calcium and carbonate data as water tracers, (2) to estimate the effect of pack ice on air-sea exchange of gases and on calcium and carbon cycles, (3) to quantify the CO_2 flux between atmosphere and the polar water, (4) to estimate the penetration depth of the fossil fuel CO_2, and (5) to quantify the error in densities calculated from the seawater equation of state.

This report includes weighted monthly /sup 3/H-means from 23 precipitation sampling stations, /sup 3/H-concentrations of daily precipitation samples from the station Wien-Arsenal, and /sup 3/H-concentrations of monthly samples from 17 surface water sampling stations of the year 1985.

16792 **Inhomogeneous distribution of tracers in the abyssal southern ocean.** Chen, C.T.A.; Rodman, M.R. (Oregon State univ., Corvallis). *Antarctic Journal of the United States;* 68(1984).

The deep and bottom waters around Antarctica have been reported to be quite homogeneous in radiocarbon concentration and to a somewhat lesser extent in tritium content. The presence of a bottom layer with clearly marked higher tritium values than in the deep water zone [e.g., typical bottom values of more than 0.1 tritium unit (TU) relative to deep water of about 0 TU; 1 TU = 10^{18} T/H where T/H is the isotopic hydrogen ratio $^{3}H/^{1}H$] is well documented. This situation is interpreted to mean that bottom waters contain significant percentages of relatively young waters (i.e., waters of recent surface origin). Chen and Poisson also indicate that the antarctic bottom water (AABW) contains some excess carbon dioxide, again suggesting that a portion of AABW was recently in contact with the atmosphere.

From 6. international conference on methods in protein sequence analysis; Seattle, WA, USA (1 Aug 1986).

While earlier work showed that the carboxyl groups of proteins could be quantitatively coupled to amino groups at pH 4.75 in the presence of EDC and a denaturing agent, the work presented here indicates that under milder conditions the modification of side-

chain carboxyls is limited and somewhat specific. Most of the incorporated glycine ethyl ester (GEE) is apparently bound to five carboxyls. The total GEE incorporated was 3 to 4 moles/mole of protein as measured by an increase in Gly upon acid hydrolysis and amino acid analysis, as well as total radioactivity. 3.55 residues were found in peptides, 2.75 bound to residues 1 to 4, and 0.8 bound to Gly-100. 9 refs., 2 figs., 2 tabs.

(Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004943.

From Electrophoresis '86: 5th meeting of the International Electrophoresis Society; London, UK (9 Sep 1986).

A simple procedure is described to extract proteins from polyacrylamide gels and subsequently separate them after partial proteolysis. This method is useful for the biochemical characterization of individual proteins in two-dimensional gel patterns and for the identification of both similarities and differences between a pair of related protein spots. Because the number of gel spots to be extracted and the extraction volume can be adjusted in this procedure, differences in the primary structure of both abundant and minor proteins can be investigated. By extracting protein from 10 or more gel spots, enough protein should be obtained to allow amino acid sequencing of peptides that carry significant amino acid differences. 7 refs., 1 fig., 1 tab.

16796 **Oxygen-regulated mRNAs for light-harvesting and reaction center complexes and for bacteriochlorophyll and carotenoid biosynthesis in Rhodobacter capsulatus during the shift from anaerobic to aerobic growth.** Zhu, Y.S.; Cook, D.N.; Leach, F.; Armstrong, G.A.; Alberti, M.; Hearst, J.E. (Lawrence Berkeley Lab., CA). *Journal of Bacteriology;* **168**: No. 3, 1180-1188(Dec 1986). Contract AC03-76SF00098.

The stability and regulation by oxygen of mRNAs for the photosynthetic apparatus in Rhodobacter capsulatus have been studied by using proflavin to inhibit transcription and by shifting cells from anaerobic to aerobic conditions. The results from the inhibition experiments show that the mRNA for the light-harvesting LH-II polypeptides (β, α) is more stable than that for the light-harvesting LH-I polypeptides (β, α) during anaerobic growth, whereas the mRNAs for the reaction center polypeptides L (RC-L), M (RC-M), and H (RC-H) are less stable than both the LH-I and LH-II mRNAs. When photosynthetic cells were shifted from anaerobic to aerobic conditions, an immediate decrease in the levels of mRNA for the LH-I, LH-II, RC-L, RC-M, and RC-H proteins was observed. The levels of mRNA for the LH-II proteins, however, is more sensitive to oxygen and is reduced faster than the level of mRNA and for the LH-I proteins. These results suggest that oxygen represses the expression of genes coding for the light-harvesting antenna and reaction center complexes and may selectively accelerate the degradation of mRNA for the LH-II proteins. The mRNAs for several enzymes in the bacteriochlorophyll biosynthetic pathway are regulated by oxygen in a similar manner. The authors found that the amounts of mRNAs for carotenoid biosynthetic enzymes, relative to the amounts of mRNAs for LH and RC, increased during the shift from anaerobic to aerobic conditions. They have particularly shown that although the expression of most photosynthetic genes in R. capsulatus is repressed b oxygen, the ctA gene responds to oxygen in an opposite fashion.

16797 **Effects of pH on calcium release from rod outer segment discs.** Whalen, M.M.; Bitensky, M.W. (Los Alamos National Lab., NM). *Federation Proceedings, Federation of American Societies for Experimental Biology;* **45**: No. 6, 1831(May 1986). (CONF-8606151—).

From 76. annual meeting of the Federation of American Society for Experimental Biology; Washington, DC, USA (8 Jun 1986).

Using isolated rod outer segment discs from bovine retina the authors have studied the effect of pH on the release of ^{45}Ca. ^{45}Ca was loaded into the discs using the ATP-dependent calcium uptake activity of the disc membrane. Measurements were made at 1 or 5 min. 250 μM cGMP released 12.9 +/- 7% of the ^{45}Ca over the pH range 6.9-7.9 and 3.1 +/- 2.8% at pH 6.4 (^{45}Ca is only a portion of the total disc calcium; actual release is greater). 25 μM 8-BrcGMP (more potent than cGMP at releasing disc calcium) released 10.6 +/- 2.0% of the ^{45}Ca over the 6.9-7.9 pH range and 1.4 +/- 1.5% at pH 6.4. 250 μM cAMP released 1.0 +/- 1.3% of the ^{45}Ca at pH 6.9. The external calcium level was submicromolar in the above experiments. When the external calcium was micromolar or above there was a release of ^{45}Ca from discs incubated at pH 7.9 as compared to those at pH 6.9 of 11.2 +/- 1.9%. The release was apparently due to pH alone as no cyclic nucleotide was present in the incubation buffers. This release at pH 7.9 was not seen when the external calcium was submicromolar. This data indicates that the ^{45}Ca release being studied is specific to cGMP (as cAMP at the same conc. caused minimal release) and that the ability of cGMP to release calcium from ROS discs is attenuated at pH 6.4 as compared to the release at pH 6.9-7.9 (submicromolar external free calcium). It also indicates that high pH alone can cause calcium release from discs when the external free calcium level is micromolar or above.

16798 **Levels of uracil DNA glycosylase and AP endonuclease in murine B- and T-lymphocytes do not change with age.** Barnard, J.; La Belle, M.; Linn, S. (Univ. of California, Berkeley). *Experimental Cell Biology;* **163**: No. 2, 500-508(Apr 1986). Contract AT03-76EV10109.

Two DNA repair enzyme activities, uracil DNA glycosylase and AP endonuclase, were measured in extracts of T- and B-lymphocytes isolated from mice ranging in age from 3 to 24 months. T- and B-lymphocytes had roughly equal levels of AP endonuclease which did not change appreciably with age. T-lymphocytes had roughly twice as high a level of uracil DNA glycosylase as B-lymphocytes; these levels were not affected by age either. This constancy with age contrasts dramatically with increases in both enzymes-roughly 3-fold on a protein basis or 50-fold on a per cell basis - in a transformed line (MPC-11) derived from a carcinogen-induced lymphocytoma. These results are similar to those obtained with cultured murine fibroblasts, wherein a relative constancy was noted with passage of nontransformed cells, followed by dramatic changes upon transformation. Hence, these enzyme assays do not support the notion of a drop in base excision DNA repair capacity as being a causative factor in aging, but suggest instead that DNA repair properties might differ dramatically in transformed vs nontransformed cells.

16799 **(PNL—5500-Pt.4, pp 39-40) Flow-cytometric analysis of plateau-phase mammalian cell populations.** Nelson, J.M.; Todd, P.; Metting, N.F. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

The authors have already shown that starved Chinese hamster ovary (CHO) cells accumulate in the G1 phase and, to a lesser extent, in other parts of the cell cycle, while fed cells continue to progress parasynchronously with a periodicity that reflects the feeding schedule. They have further characterized these kinetic differences by flow-cytometric techniques. DNA distributions were determined as a function of time by fixing trypsinized cells and staining them with the acriflavine-Feulgen procedure for DNA flow-microfluorimetric (FMF) analysis using an EPICS V cell sorter located at Pennsylvania State University. The amount of DNA present and other related characteristics of cells from both fed and starved plateau-phase cultures were monitored as the cultures grew to confluence and then passed into late plateau phase. Additionally, 14-day-old fed and starved plateau-phase cultures were dispersed and the subcultured cells followed, as they passed through their first post-plateau-phase cycles. In addition to verifying the conclusions drawn earlier, these studies also verified the existence of nonincorporating S-phase cells in the starved populations. These cells have S-phase DNA content, even though they do not incorporate [^{3}H]TdR and probably are not synthesizing DNA.

16800 Determination of bacterial cell volume with the coulter counter. Kubitschek, H.E.; Friske, J.A. (Argonne National Lab., IL). *Journal of Bacteriology;* **168**: No. 3, 1466-1467(Dec 1986). Contract W-31-109-ENG-38.

Two methods were used to determine mean volumes of cells of Escherichia coli B/rA in both stationary- and exponential-phase cultures, i.e., (i) electronic measurement with a Coulter Counter-Analyzer system and (ii) biophysical measurement of the total volume and number of cells in sedimented cell pellets. Within experimental errors, the methods gave the same mean cell volumes.

16801 Cell motion, contractile networks, and the physics of interpenetrating reactive flow. Dembo, M.; Harlow, F. (Los Alamos National Lab., NM). *Biophysical Journal;* **50**: No. 1, 109-121(Jul 1986).

In this paper the authors propose a physical model of contractile biological polymer networks based on the notion of reactive interpenetrating flow. They show how their model leads to a mathematical formulation of the dynamical laws governing the behavior of contractile networks. They also develop estimates of the various parameters that appear in their equations, and discuss some elementary predictions of the model concerning the general scaling principles that pertain to the motions of contractile networks.

16802 Numerical studies of unreactive contractile networks. Dembo, M.; Maltrud, M.; Harlow, F. (Los Alamos National Lab., NM). *Biophysical Journal;* **50**: No. 1, 123-137(Jul 1986).

The authors present a finite difference algorithm for integrating the reactive flow model of contractile biological polymer networks on a fixed Eulerian mesh. They discuss the accuracy and limits of the algorithm. To illustrate the application of the algorithm, they carry out a family of computations involving an unreactive contractile network contained in a two-dimensional square reaction vessel. By numerical experiments using different values of the physical parameters of the model, they find that for this simple sort of system two major dynamical modes of contraction are predicted to occur. There is the squeezing type contraction in which the network contracts to a single small clump with gradual expulsion of solution material, and the rending type contraction in which the network tears itself into a number of separate pieces. They find that to a good approximation the transition between the squeezing mode and the rending mode is controlled by a single nondimensional number (the rending number). They discuss the relevance of these results for the analysis of various experimental observations.

16803 Hypervirulence of Agrobacterium tumefaciens A281 is encoded in a region of pTiBo542 outside of T-DNA. Hood, E.E.; Helmer, G.L.; Fraley, R.T.; Chilton, M.D. (Washington Univ., St. Louis, MO). *Journal of Bacteriology;* **168**: No. 3, 1291-1301(Dec 1986). Contract AC02-81ER10888.

A binary-vectory strategy was used to study the hypervirulence of Agrobacterium tumefaciens A281, an L,L-succinamopine strain. Strain A281 is hypervirulent on several solanaceous plants. Plasmids were constructed (pCS65 and pCS277) carrying either the transferred DNA (T-DNA) or the remainder of the tumor-inducing (Ti) plasmid (pEHA101) from this strain and tested each of these constructs were tested in trans with complementary each of regions from heterologous Ti plasmids. Hypervirulence on tobacco could be reconstructed in a bipartite strain with the L,L-succinamopine T-DNA and the vir region on separate plasmids. pEHA101 was able to complement octopine T-DNA to hypervirulence on tobacco and tomato plants. Nopaline T-DNA was complemented better on tomato plants by pEHA101 than it was by its own nopaline vir region, but not to hypervirulence. L,L-Succinamopine T-DNA could not be complemented to hypervirulence on tobacco and tomato plants with either heterologous vir region. From these results the authors suggest that the hypervirulence of strain A281 is due to non-T-DNA sequences on the Ti plasmid.

16804 T-DNA and opine synthetic loci in tumors incited by Agrobacterium tumefaciens A281 on soybean and alfalfa plants. Hood, E.E.; Chilton, W.S.; Chilton, M.D.; Fraley, R.T. (Washington Univ., St. Louis, MO). *Journal of Bacteriology;* **168**: No. 3, 1283-1290(Dec 1986). Contract AC02-81ER10888.

A report is given of the molecular characterization of transferred DNA (T-DNA) in leguminous tumors incited by Agrobacterium tumefaciens A281 harboring the tumor-inducing plasmid pTiBo542. The T-DNA is composed of two regions named T/sub L/ (left portion)-DNA and T/sub R/ (right portion)-DNA, in accordance with the nomenclature for the octopine strains. T/sub L/-DNA is defined by several internal HindIII restriction fragments totaling 10.8 kilobase pairs (kbp) in uncloned soybean and alfalfa tumors. Alfalfa tumor DNA may contain one more HindIII fragment at the left end of T/sub L/-DNA that does soybean tumor DNA. T/sub R/-DNA has a 5.8-kbp BamHI-EcoRi internal fragment. All borders other than the left border of T/sub L/-DNA appear to be the same within the detection limits of Southern blot hybridization experiments. The two T-DNA regions are separated by 16 to 19 kbp of DNA not stably maintained in tumors. The distance from the left border of T/sub L/-DNA to the right border of T/sub R/-DNA is approximately 40 kbp. Loci for the mannityl opines are situated in T/sub R/-DNA, based on genetic and biochemical criteria.

16805 Seasonal patterns of leaf photosynthetic capacity in successional northern hardwood tree species. Jurik, T.W. (Univ. of Michigan Biological Station, Ann Arbor). *American Journal of Botany;* **73**: No. 1, 131-138(1986). Contract AC02-79EV10091.

Seasonal patterns of leaf photosynthetic capacity and conductance were determined for deciduous hardwood tree species in natural habitats in northern lower Michigan. Leaves of bigtooth aspen and red oak at the top of the canopy had higher maximum CO_2 Exchange Rate (CER) (10-15 $\mu mol\ m^{-2}\ s^{-1}$) than leaves of sugar maple, red maple, red oak, and beech growing in the understory (4-5 $\mu mol\ m^{-2}\ s^{-1}$). In all leaves, CER measured at light-saturation increased to a maximum near the completion of leaf expansion in early June, was constant until mid-September, and then rapidly declined until leaf death. A similar pattern was seen for CER measured in low light (1.5% full sun). Respiration rate in the dark was highest in young leaves and decreased during leaf expansion; a relatively constant rate was then maintained for the rest of leaf lifespan. The seasonal pattern of the initial slope of the light response of CER paralleled the pattern of light-saturated CER. The initial slope in midsummer ranged from values of 37 to 44 $\mu mol/mol$ for species in the understory to 51 and 56 $\mu mol/mol$ for red oak and bigtooth aspen, respectively, at the top of the canopy. Leaf conductance was constant throughout most of leaf lifespan, with some decline occurring in autumn. Leaves at the top of the canopy had higher conductances for water vapor (2-5 mm/s) than leaves in the understory (1-2 mm/s). All species maintained leaf intercellular CO_2 mole fractions (c/sub i/) near 200 $\mu L/L$ until autumn, when c/sub i/ increased during leaf senescence.

16806 Constant phycobilisome size in chromatically adapted cells of the cyanobacterium Tolypothrix tenuis, and variation in Nostoc sp. Ohki, K.; Gantt, E.; Lipschultz, C.A.; Ernst, M.C. (Smithsonian Environmental Research Center, Rockville, MD). *Plant Physiology;* **79**: No. 4, 943-948(Dec 1985). Contract AS05-76ER04310.

Phycobilisomes of Tolypothrix tenuis, a cyanobacterium capable of complete chromatic adaptation, were studied from cells grown in red and green light, and in darkness. The phycobilisome size remained constant irrespective of the light quality. The hemidiscoidal phycobilisomes had an average diameter of about 52 nanometers and height of about 33 nanometers, by negative staining. The thickness was equivalent to a physocyanin molecule (about 10 nanometers). The molar ratio of allophycocyanin, relative to other

phycobiliproteins always remained at about 1:3. Phycobilisomes from red light grown cells and cells grown heterotrophically in darkness were indistinguishable in their pigment composition, polypeptide pattern, and size. Eight polypeptides were resolved in the phycobilin region (17.5 to 23.5 kilodaltons) by isoelectric focusing followed by sodium dodecyl sulfate-polyacrylamide gel electrophoresis. Half of these were invariable, while others were variable in green and red light. It is inferred that phycoerythrin synthesis in green light resulted in a one for one substitution of phycocyanin, thus retaining a constant phycobilisome size. Tolypothrix appears to be one of the best examples of phycobiliprotein regulation with wavelength. By contrast, in Nostoc sp., the decrease in phycoerythrin in red light cells was accompanied by a decrease in phycobilisome size but not a regulated substitution.

16807 **Light intensity adaptation and phycobilisome composition of Microcystis aeruginosa.** Raps, S.; Kycia, J.H.; Ledbetter, M.C.; Siegelman, H.W. (CUNY, New York, NY). *Plant Physiology;* 79: No. 4, 983-987(Dec 1985).

Phycobilisomes isolated from Microcystis aeruginosa grown to midlog at high light (270 microeinsteins per square meter per second) or at low light intensities (40 microeinsteins per square meter per second) were found to be identical. Electron micrographs established that they have a triangular central core apparently consisting of three allophycocyanin trimers surrounded by six rods, each composed of two hexameric phycocyanin molecules. The apparent mass of a phycobilisome obtained by gel filtration is 2.96 x 10^6 daltons. The molar ratio of the phycobiliproteins per phycobilisome is 12 phycocyanin hexamers:9 allophycocyanin trimers. The electron microscopic observations combined with the phycobilisome apparent mass and the phycobiliprotein stoichiometry data indicate that M. aeruginosa phycobilisomes are composed of a triangular central core of three stacks of three allophycocyanin trimers and six rods each containing two phycocyanin hexamers. Adaptation of M. aeruginosa to high light intensity results in a decrease in the number of phycobilisomes per cell with no alteration in phycobilisome composition or structure.

16808 **Auxin regulation of a proton translocating ATPase in pea root plasma membrane vesicles.** Gabathuler, R.; Cleland, R.E. (Univ. of Washington, Seattle). *Plant Physiology;* 79: No. 4, 1080-1085(Dec 1985). Contract AT06-70ER73019.

Pea root microsomal vesicles have been fractionated on a Dextran step gradient to give three fractions, each of which carries out ATP-dependent proton accumulation as measured by fluorescence quenching of quinacrine. The fraction at the 4/6% Dextran interface is enriched in plasma membrane, as determined by UDPG sterol glucosyltransferase and vanadate-inhibited ATPase. The vanadate-sensitive phosphohydrolase is not specific for ATP, has a K/sub m/ of about 0.23 millimolar for MgATP, is only slightly affected by K^+ or Cl^- and is insensitive to auxin. Proton transport, on the other hand, is more specific for ATP, enhanced by anions ($NO_3^- > Cl^-$) and has a K/sub m/ of about 0.7 millimolar. Auxins decrease the K/sub m/ to about 0.35 millimolar, with no significant effect on the V/sub max/, while antiauxins or weak acids have no such effect. It appears that auxin has the ability to alter the efficiency of the ATP-driven proton transport.

16809 **Carbon dioxide exchange and growth of a pine plantation.** Murphy, C.E. Jr. (E.I. du Pont de Nemours & Co., Aiken, SC). *Forest Ecology and Management;* 11: 203-224(1985). Contract AC09-76SR00001.

The exchange of materials between the atmosphere and terrestrial ecosystems is important to an understanding of the cycling of essential elements, the deposition of materials from the atmosphere and the entrance of pollutants into the forest ecosystems. This paper reports the results of measurements of carbon dioxide exchange in a vigorously growing pine plantation. Measurement data were incorporated into a model used to estimate annual carbon dioxide exchange. The measured annual biomass accumulation in the same plantation was used to determine a carbon dioxide to biomass conversion efficiency. Carbon dioxide exchange was 10.5 t/ha and biomass accumulation was 4.5 t/ha. The conversion efficiency of carbon dioxide to biomass is about 25% less than the theoretical chemical conversion efficiency. Considering the possible errors in both the estimates, this is very good agreement. 27 references, 8 figures, 5 tables.

16810 **Model of carbon dioxide assimilation in Chlamydomonas reinhardii.** Spalding, M.H.; Portis, A.R. Jr. (Michigan State Univ., East Lansing). *Planta;* 164: 308-320(1985). Contract AC02-76ER01338.

A simple model of photosynthetic CO_2 assimilation in Chlamydomonas has been developed in order to evaluate whether a CO_2-concentrating system could explain the photosynthetic characteristics of this alga (high apparent affinity for CO_2, low photorespiration, little O_2 inhibition of photosynthesis, and low CO_2 compensation concentration). Similarly, the model was developed to evaluate whether the proposed defects in the CO_2-concentrating system of two Chlamydomonas mutants were consistent with their observed photosynthetic characteristics. The model treats a Chlamydomonas cell as a single compartment with two carbon inputs: passive diffusion of CO_2, and active transport of HCO_3^-. Internal inorganic carbon was considered to have two potential fates: assimilation to fixed carbon via ribulose 1,5-bisphosphate carboxylase-oxygenase or exiting the cell by either passive CO_2 diffusion or reversal of HCO_3^- transport. Published values for kinetic parameters were used where possible. The model accurately reproduced the CO_2-response curves of photosynthesis for wild-type Chlamydomonas, the two mutants defective in the CO_2-concentrating system, and a double mutant constructed by crossing these two mutants. The model also predicts steady-state internal inorganic-carbon concentrations in reasonable agreement with measured values in all four cases. Carbon dioxide compensation concentrations for wild-type Chlamydomonas were accurately predicted by the model and those predicted for the mutants were in qualitative agreement with measured values. The model also allowed calculation of approximate energy costs of the CO_2-concentrating system. These calculations indicate that the system may be no more energy-costly than CO_4 photosynthesis. 38 references, 4 figures, 4 tables.

16811 **(DOE/OR/21400—T283) Medical isotopes at Oak Ridge National Laboratory.** Setaro, J.A. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005332.

This presentation discusses briefly the overall field of radioisotope applications in medicine, describes the overall field of radioisotope applications in medicine and describes the current involvement of Oak Ridge National Laboratory (ORNL) in this field.

16812 **(FNAL-TM—1428) Surface contouring with a range finder.** Todd, T.J.; Lennox, A. (Fermi National Accelerator Lab., Batavia, IL (USA)). Aug 1986. Contract AC02-76CH03000. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005559.

New patients at the Neutron Therapy Facility must be contoured so that the staff might offer safe and effective treatment. A new system using the lasers and rotating chair that are in the treatment room, a range finder that projects a scale, a contour board marked with polar coordinates, and a swing scale has been implemented. This system significantly improves the accuracy of the contours drawn and should prove to be a time saver in difficult contours, such as those found about the head. Patients will benefit in that the contouring process will be more efficient and accurate. This system may be of use in other situations at Fermilab needing surface contouring through a cross section. Its scale is marked in whole units, and requires low background light conditions to be seen. Modification of the geometry of NTF's system can change the spacing of marks on the scale, but readings would no longer be in 1 cm units, and would require a conversion factor to draw a contour at full scale. The range finder is accurate at distances less than 55 cm from the isocenter. 6 figs.

16813 **(ORNL/TM—10294) Nuclear medicine: Progress report for quarter ending September 30, 1986.** Knapp, F.F. Jr.; Ambrose, K.R.; Goodman, M.M.; Srivastava, P.C. (Oak Ridge National Lab., TN (USA)). Feb 1987. Contract AC05-84OR21400. 20p. NTIS, PC A03/MF A01. File Number DE87005288.

The synthesis of two new dimethyl-branched analogues of 15-(p-iodophenyl)-3,3′-dimethylpentadecanoic acid (DMIPP) is described. Methyl-branching was introduced into the 6- and 9-positions to determine the effect of the position of dimethyl-branching on myocardial uptake and clearance kinetics in rats. The goal of these studies is to maximize heart uptake and retention and minimize blood and liver uptake. The 6,6′-dimethyl- (6,6′-DMIPP) and 9.9′-dimethyl- (9,9′-DMIPP) analogues were prepared by multi-step sequences involving successive Friedel-Crafts/Wolf Kishner reactions on thiophene. Regiospecific para-iodination using thallation and treatment with iodide provided the two new analogues. The 9,9′-[I-125]DMIPP was evaluated in rats and showed somewhat lower uptake than 3,3′-DMIPP (3.13 dose/gm at 5 min versus 4.18) and more rapid clearance (~30% at 1 h). In addition the heart:blood ratios were lower for the 9,9′-dimethyl isomer. These studies have demonstrated the effects of the position of dimethyl substitution on uptake and retention. 1 ref., 3 figs., 2 tabs.

16814 **(PB—87-107892/XAB) Selection of patients for x-ray examinations: skull x-ray examination for trauma.** (Food and Drug Administration, Rockville, MD (USA). Center for Devices and Radiological Health). Jun 1986. 35p. (HHS/PUB/FDA—86-8263). NTIS, PC A03/MF A01.

From a review of the literature and using data provided by a comprehensive FDA study, referral criteria in the form of an algorithm or strategy were developed for the radiological management of patients with head injuries. The algorithm assigns patients to groups of low, moderate, or high risk, according to the severity of their clinical signs and symptoms and the medical history of the trauma. Radiological management of the patient is then based on the risk group.

16815 (PNL—5500-Pt.4, pp 40-41) **Kinetic differences between fed and starved Chinese hamster ovary cells.** Nelson, J.M.; Todd, P.; Metting, N.F. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

When Chinese hamster ovary (CHO) cells are grown as monolayer cultures, they eventually reach a population-density plateau after which no net increase in cell numbers occurs. A manuscript has recently been published which draws attention to the important, and perhaps unexpected, differences in the kinetic status of different types of plateau-phase CHO cells (Nelson, Todd and Metting 1984). The essence of this manuscript and the most significant findings are summarized in this paper.

16816 **Improved delineation of human dopamine receptors using [18F]-N-methylspiroperidol and PET.** Arnett, C.D.; Wolf, A.P.; Shiue, C.Y.; Fowler, J.S.; MacGregor, R.R.; Christman, D.R.; Smith, M.R. (Brookhaven National Lab., Upton, NY). *Journal of Nuclear Medicine;* No. 12, 1878-1882(Dec 1986).

The brain uptake of [18F]-N-methylspiroperidol, a butyrophenone neuroleptic with high selectivity for the dopamine receptor, has been measured in three normal human volunteers using positron emission tomography for times up to 12 hr postinjection. These studies demonstrated two unique findings concerning the in vivo distribution of this neuroleptic: (a) it is tightly bound to dopamine D-2 receptors in the caudate-putamen brain regions, and (b) these regions are the only large brain structures which exhibit appreciable long-term retention. In addition, radioactivity clears rapidly from plasma, and the percentage of unchanged [18F]-N-methylspiroperidol in plasma declines rapidly. These results suggest that this compound binds irreversibly to dopamine D-2 receptors, and that there are few if any dopamine D-2 receptors in the human frontal cortex. These studies emphasize not only the importance of characterizing neurotransmitter receptors in living human brain using a ligand labeled with a positron emitting nuclide of sufficiently long half-life to allow monitoring of brain radioactivity distribution for several hours after the injection of radioligand, but also of accurately determining the amount of unchanged tracer in plasma for tracer kinetic modeling.

16817 **Scaling in biological nuclear magnetic resonance spectral distributions.** Lacelle, S. (Iowa State Univ., Ames). *Biophysical Journal;* 50: No. 1, 21-26(Jul 1986). Contract W-7405-ENG-82.

A statistical analysis of the distribution of the eigenvalues of the chemical shift interaction as detected by nuclear magnetic resonance (NMR) spectroscopy in large biological systems is presented in the light of random matrix theory. A power law dependence is experimentally observed for the distribution of the number of eigenvalues, N, of the shielding hamiltonian with ϵ/sub i/ ∂ E as a function of the energy E. From this cumulative distribution of energy levels, N(E), we also obtain a density of states rho(E). The exponent of the energy variation of N(E) and rho(E) are correlated with the dimensionality of the molecular system. A crossover in the values of the exponents is found in passing from low to higher energy in the spectra. Our method classifies and reduces the chemical shift data base of proteins and also demonstrates a degree of regularity in seemingly irregular spectral patterns.

16818 **Design and evaluation of new ruthenium labeled radiopharmaceuticals for the pancreas and heart.** Soine, W.H.; Guyer, C.E.; Knapp, F.F. Jr. (Nuclear Medicine Group, Oak Ridge National Lab., Oak Ridge, TN). *Journal of Nuclear Medicine;* 25: No. 5, 120(1984). (CONF-840619—). Contract W-7405-ENG-26.

From 31. annual meeting of the Society of Nuclear Medicine; Los Angeles, CA, USA (5 Jun 1984).

Ruthenium-97 has attractive properties for use in diagnostic nuclear medicine (T1/2 2.9 d, 216 keV γ in 86% abundance). A five-step route has been developed for the synthesis of β-ruthenocenylalanine (V) as a model ruthenocene-substituted amino acid. Ruthenocene (I) was converted to dimethylaminomethylruthenocene (II) by condensation with [Me/sub 2/N]/sub 2/CH/sub 2/ in HOAc-H/sub 3/PO/sub 4/, and II quaternized to (ruthenocylmethyl) trimethylammonium iodide (III) with excess CH/sub 3/I. Reaction of (III) with the anion of diethylformidomalonate, formed with NaOMe-EtOH, then gave diethyl(ruthenocylmethyl) formamidomalonate (IV). Hydrolysis of (IV) with KOH and cation (AG-50W, X-8) and anion (AG-1, X-2) purification gave B-ruthenocenyalanine (V). Also, III was converted to the corresponding triphenylphosphonium cation (VI) by treatment with phi/sub 3/P. Compounds I-IV were homogeneous by TLC and exhibited the expected NMR and MS properties. Ru-103 (Ru;T1/2 39.4 d) was used in the radiochemical syntheses. Reaction of RuCl/sub 3/ with Na-cyclopentadienide gave Ru-(I); converted to Ru-(V) by the five-step sequence. Ru-(V) showed low pancreatic uptake (mean % ID/gm) in rats (5min, 0.361;60 min, 0.299). Ru(VI) showed low heart uptake (30 min, 0.37) and low heart:blood ratios (1.5:1) in rats. In contrast, Ru-(III) showed good heart uptake in rats (30 min,0.68) and high heart:blood ratios (8:1). These studies indicate that similar /sup 97/Ru-labeled cations are good candidates for further evaluation for heart imaging.

16819 **A calibration phantom for absolute quantitation of radionuclide uptake by SPECT.** Macey, D.J.; De Nardo, G.L.; De Nardo, S.J.; Hines, H.H. (Univ. of California Davis Medical Center, Sacramento, CA). *Journal of Nuclear Medicine;* 25: No. 5, 105(1984). (CONF-840619—).

From 31. annual meeting of the Society of Nuclear Medicine; Los Angeles, CA, USA (5 Jun 1984).

Absolute quantitation of radionuclide uptake in small volumes or organs is of interest for nuclear medicine procedures including the estimation of radiation dose in radioimmunotherapy. The use of a calibration phantom for absolute quantitation of a radionuclide in small volumes in a transverse section image of a SPECT phantom with a rotating gamma camera has been investigated. The calibration phantom is a set of 4 tubes filled with a suitable range of specific activity of the radionuclide in solution. This is scanned simultaneously with the SPECT phantom or patient. The tubes can either be placed at appropriate points on the patient boundary or enclosed in a tissue equivalent crescent-shaped phantom which is either attached to the underside of the SPECT table

or placed on the patient to preserve the ellipse for attenuation compensation. A region of interest (ROI) for each tube and volume in the transverse section image was defined with an appropriate threshold of about 10% and the variation of counts in the ROI versus specific activity was found to be linear over the range 1 to 100μCiml/sup -1/. However, the counts from the calibration phantom were found to depend on the total activity in the transverse section slice, the size and effective attenuation coefficient of the transverse section, the reconstruction filter used and the accuracy of boundary detection for attenuation compensation. Preliminary results indicate that this SPECT calibration phantom can be used for absolute quantitation of radionuclide uptake in a selected site in the body, provided attenuation compensation is satisfactory. Also, the method will simplify determination of cumulated activity for radiation dose calculations.

16820 **Which collimator for SPECT with I-123 and CU-67.** De Nardo, G.L.; Macey, D.J.; De Nardo, S.J.; Hines, H.H.; Cole, W.C. (Univ. of California Davis Medical Center, Sacramento, CA). *Journal of Nuclear Medicine;* **25**: No. 5, 105(1984). (CONF-840619—).

From 31. annual meeting of the Society of Nuclear Medicine; Los Angeles, CA, USA (5 Jun 1984).

Cu-67 has been suggested for use in radioimmunoimaging and radioimmunotherapy because of its suitable photon energy for imaging (185 keV, 47%) and optimum beta emissions for therapy (0.577 keV, 20%; 0.484 keV, 35%; 0.395 keV, 45%). I-123 has been used in radioimmunoimaging and other procedures. Phantom resolution with I-123 (p,5n) appears comparable to that of Tc-99m using the usual low energy collimators. However, photons of energy greater than 200 keV are also emitted by these radionuclides with relative abundances of 1.3% for Cu-67 and 2.4% for I-123 (p,5n). Collimator septal penetration is a much larger fraction of the photopeak counts and causes degraded uniformity on transverse section images. The authors have examined the performance of 2 low, one medium (300 keV) and one high energy (364 keV) commercially available collimators using Cu-67 or I-123 in a SPECT phantom. The gamma ray spectra, SPECT sensitivity, spatial resolution and uniformity performance were assessed for a rotating gamma camera system. The low energy collimators gave transverse section images with serious nonuniformity artifacts and no possibility of applying an attenuation compensation algorithm. The 300 keV collimator produced better images for I-123 although the performance was degraded relative to Tc-99m and the low energy collimators. However, the 'cold' defect resolution showed little difference between collimators and radionuclides. The authors conclude that the 300 keV collimator represents the better compromise for SPECT tomography with either I-123 (p,5n) or Cu-67.

16821 **Linearity and energy corrections for scintillation cameras used in quantitative single photon emission computed tomography.** Bizais, Y.J.; Rowe, R.W.; Zubal, I.G.; Bennett, G.W.; Brill, A.B. (Brookhaven National Lab., Upton, NY). *Journal of Nuclear Medicine;* **25**: No. 5, 87(1984). (CONF-840619—).

From 31. annual meeting of the Society of Nuclear Medicine; Los Angeles, CA, USA (5 Jun 1984).

The reconstruction process associated with single photon emission computer tomography (SPECT) greatly amplifies the distortions inherent in the planar projections. The authors show that in order to produce acceptable, quantitative, SPECT reconstructions, the degree of distortion that can be tolerated in the projection data is much lower than that still present after conventional correction algorithms have been applied. For example, flood field non-uniformity corrections and sliding energy window methods are most commonly used, but unacceptable non-uniformity still remains. In order to decrease non-uniformity further, a camera system which permits the determination of the center and width of the photopeak as a function of position on the detector is necessary. The authors have found that a spatially variant, asymmetric, software window, which is normalized to the width of the photopeak, is important in rejecting scatter events more correctly. In addition, an improved software correction for spatial non-linearities is applied. Correcting for spatial non-linearity alone, reduced the non-uniformity of a flood field, imaged with a global asymmetric window (-3.5%, +15%), from 30% to 25%. A sliding window correction for energy distortions alone, resulted in a non-uniformity of 15%. Combination of both the spatial and simple energy distortion correction reduced the non-uniformity to 8%. However, use of the proportional window correction, together with the spatial correction, brought the non-uniformity down to an acceptable 3%. Simulation studies demonstrated the effect of varying energy window characteristics on non-uniformity and scatter rejection.

16822 **Radiopharmaceutical delivery system for controlled arterial concentration in physiologic modeling with computed tomography.** Lambrecht, R.M.; Hanson, J.; Lepera, F. (Brookhaven National Lab., Upton, NY). *Journal of Nuclear Medicine;* **25**: No. 5, 89(1984). (CONF-840619—).

From 31. annual meeting of the Society of Nuclear Medicine; Los Angeles, CA, USA (5 Jun 1984).

Physiologic models usually require the administration, maintenance and measurement of the specific concentration of the radiotracer in the circulation over specific intervals of time. An instrument has been developed that controls the injection of a radiopharmaceutical so that the arterial concentration of the tracer follows an arbitrary function [e.g., ramp (i.e., quadratic), pulse, exponential, or constant]. The system compensates for radioactive decay and for physiological difference between subjects. The system is made up of a DEC LSI computer contained in a graphics terminal with a printer output. The data from the counting chain is accumulated in a Data Translation clock/counter board. Integral and differential radioactivity is recorded as μCi/mL blood at collection rates of up to 64 k/sec. The tracer is displaced from a syringe with a Harvard infusion/withdrawal pump which was modified to accept an externally determined output. The computer interface to the syringe control is a DT27-81 A/D and D/A board. The analog output allows for control of the flowrate and also acts as a safety shutoff. The program prompts the user for functional form desired, time interval of the study, injection volume and syringe radioactivity. The ideal function is displayed prior to the run. During the run the arterial blood activity is simultaneously measured and displayed. Provision is made for entering physiological data (e.g., blood gases, glucose), subject ID, date, and parameters related to data collection by PET. Conventional detectors and NIM electronics are used to measure the arterial radioactivity.

16823 **In vivo monitoring of line 168 mammary tumors by topical nuclear magnetic resonance.** Adams, D.; De Nardo, G.; Dallas, J.; Erickson, K.; De Nardo, S. (Univ. of California, Davis, CA). *Journal of Nuclear Medicine;* **25**: No. 5, 111(1984). (CONF-840619—).

From 31. annual meeting of the Society of Nuclear Medicine; Los Angeles, CA, USA (5 Jun 1984).

Radioimmunotherapy (RIT) shows considerable potential in the treatment of cancer. Recent advances in nuclear magnetic resonance spectroscopy have made in vivo imaging for clinical purposes a reality. Basic biochemical events can be monitored in vivo with /sup 31/p and /sup 13/C topical magnetic resonance (TMR). The authors have developed radiolabeled monoclonal antibodies/antibody fragments as specific RIT agents against several tumor lines. To determine the efficacy of various radiation dosages on tumor targets in a murine model, the authors chose /sup 31/p TMR to allow nondestructive monitoring of tumor metabolism in vivo. Major sources of free energy in cells contain phosphorus; NMR signal intensities are proportional to concentrations of nuclei in a given environment. Relative ratios of phosphorus metabolites describe the physiological status of tissue. TMR of 168 mammary tumors in BALB/C mice indicated that the peak intensity of inorganic phosphate and phosphocreatine (PCr) resonances correlated well with the presence and extent of necrosis. The spectrum of a tumor in which cells were rapidly dividing was significantly different from the necrotic tumor. Relative ratios of ATP and PCr provided information on metabolic function within the tumor. Striking spectral differences between rapidly dividing tumor tissue and necrotic tissue justify use of this method to predict therapeutic efficacy of RIT dosage regimens. This noninvasive determination of metabolic function appears useful in characterizing the extent of radiation-induced necrosis, spontaneous recurrence of tumor tissue, and sequential evaluation of various dose modalities. These data can be used for optimization of human RIT protocols and effective tracking of tumorigenesis in humans.

16824 **Some factors affecting the uptake of iodoamphetamine (IAMP).** Som, P.; Oster, Z.H.; Yamamoto, K.; Meinken, G.E.; Atkins, H.L.; Brill, A.B. (Brookhaven National Lab., Upton, NY). *Journal of Nuclear Medicine;* **25**: No. 5, 110(1984). (CONF-840619—).

From 31. annual meeting of the Society of Nuclear Medicine; Los Angeles, CA, USA (5 Jun 1984).

The uptake and distribution of IAMP is believed to reflect the regional blood flow, and distribution of catecholamine binding sites. With the increasing use of this substance for clinical investigation, it appears to be of interest to assess the effect of some hormones and drugs on the biodistribution of IAMP as well as the effects of hypertension. For this purpose the effects of ACTH, metyrapone, and propranolol were studies in mice. ACTH 0.2 U/mouse was injected IM 12 hrs prior to IAMP, metyrapone 0.75 mg/mouse IP 3 hrs prior to IAMP and propranolol 0.15 mg/mouse was given IV 2 hrs before IAMP injection. The IAMP distribution was determined in normotensive and hypertensive Dahl salt-sensitive rats. I-125 IAMP was prepared by a modification of the Winchell method. Tissue distribution was assessed by direct counting of samples and results were expressed as percent injected activity per organ and per gram. Pre-treatment with ACTH was found to lower IAMP concentration (% injected act./g) in brain and adrenals and total activity (% injected act.) in liver. Propranolol caused a decrease in IAMP concentration in blood and brain and metyrapone lowered IAMP concentration in the kidneys. In hypertensive rats IAMP blood concentration and total activity were higher than in the genetically identical normotensive controls. In the heart the concentration remained while the total activity increased. The possible mechanisms of these findings and their clinical significance are discussed.

16825 (DOE/ER/13101—1, pp 8-12) **Mutants of Escherichia coli affected in inducer exclusion.** Ackerman, E.B. (Univ. of Arkansas, Fayetteville). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

The uptake of carbohydrates by Escherichia coli is affected by two processes: active transport, in which the substrate appears inside the cell chemically unchanged; and by the PEP dependent phosphotransferase system, in which the carbohydrate is phosphorylated as it enters the cell. Although the mechanisms of active transport are entirely different from those of the PT-system, it is known that mutants in the PT-system may show reduced rates of growth on sugars taken up by active transport. Furthermore, it is known that glucose and non-catabolizable analogs of glucose may inhibit the induction of sugars which are taken into the cell by active transport; this phenomenon is known as inducer exclusion. The present work attempts to analyze inducer exclusion on a genetic level by directly generating mutants in inducer exclusion and then locating the locus of the mutation on the chromosome by phage transduction. 3 figures.

16826 (DOE/ER/13101—1, pp 13-17) **Anaerobic chitin degradation as a carbon and hydrogen source for sulfate reduction and methanogenesis in salt marsh bacteria.** Boyer, J.N. (Virginia Institute of Marine Science College of William & Mary, Williamsburg). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

Chitin is the major structural component of fungal cell walls and arthropod exoskeletons. Next to cellulose, it is probably the most abundant form of polymerized carbon in the marine system. It is estimated that a single planktonic crustacean, Euphausia pacifica, produces ten billion metric tons of molt chitin annually. Add to that all the micro, meio-, and macrofaunal chitin associated with sediments and the amount of carbon tied up in chitin becomes considerable. Considering the abundance of chitin in nature, very little is known of tis cycling in terms of rates, pathways, or products. Researchers tried to follow the anaerobic degradation of chitin to its end-products and to determine how these products are used by other sediment bacteria. 2 figures, 2 tables.

16827 (DOE/ER/13101—1, pp 18-29) **Feeding relationships of harpacticoid copepods and microbial flora in a salt marsh.** Decho, A.W. (Louisiana State Univ., Baton Rouge). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

Benthic harpacticoid copepods represent a predonderate link in the estuarine food web. In the upper food web they serve as food for many invertebrates and fish fry. In the lower portion of the web, it has been suggested that they feed to a large extent on the microbial flora and are therefore important in the recycling of benthic energy. While their relationships with microbes have been the subject of much literature, information regarding the actual food resources of harpacticoids is limited. Most of the studies are strictly laboratory investigations, using food material which is either easily culturable or easily accessible but not necessarily representative of the animals' natural habitat. In small drainage channels of Great Sippewissett March there occurs definite zonation of photosynthetic microbial flora. The relationships of certain harpacticoid copepod species with these photosynthetic microbes (and their associated heterothrophic bacteria) are examined. 5 figures, 4 tables.

16828 (DOE/ER/13101—1, pp 30-36) **Degradation of ortho phenol by streptomycetes in continuous cultures.** Escher, A. (Montana State Univ., Bozeman). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

Phenolic compounds are quite commonly used as pesticides. Its degradation in soils is in absence of sun light relatively slow, since it is mediated by microbial activity alone. Investigations showed that mainly some fungi and streptomycetes are responsible for the degradation of these xenobiotic compounds. The mechanisms, however, are not well understood and it appears that traditional microbial assays, i.e. batch cultures and enrichment plates, are not very helpful. The intention of this summer work was to develop some different techniques for a better understanding of the mechanisms and the kinetics of biodegradation of phenolic compounds by streptomycetes. Ortho phenyl phenol has been selected since it is the most toxic compound of the different phenols and its possible products would be less toxic (no secondary inhibition by the product). 1 table.

16829 (DOE/ER/13101—1, pp 37-41) **Chemotaxis and algal attachment of caulobacter.** Friberg, K.M. 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

As a habitat, the ocean is under practically constant nutrient limitation, and the microorganisms living there have had to develop specific feature to be able to survive and proliferate with a meager supply of growth substrates. The prosthecate bacteria, which are distributed generally as oligotrophs in nature, appear to have at least two adaptations that confer on this group of bacteria advantages in scavenging nutrients. First, they have the stalk, an appendage which during starvation periods elongates and in this manner extends the surface of the cell, and second they have a motile swarmer cell, which provides this typically sessile organism with a means of dispersal. This type of cell is a product of every reproductive event, which implies that its role in the welfare of the total population is significant. Its motility alone would disperse the population because its sibling is non-motile; however, it is reasonable to expect that its motion would be directed toward a more favorable environment. In many motile bacteria, it is known that motility can be directed by chemotaxis (a gradient of chemicals). In positive

chemotaxis, the net motion of the organism is along the increasing concentration of a chemical. In negative chemotaxis, the net motion of the organism is along the decreasing concentration of a chemical. Obviously, positive chemotaxis would be beneficial in a nutrient limited habitat. 3 tables.

16830 (DOE/ER/13101—1, pp 42-45) **Preliminary investigation of organisms capable of degrading dieldrin and aromatic compounds: techniques for isolation and characterization.** Harten, B. 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

The degradation of most organic compounds is usually due to microbial activity since nonenzymatic reactions seldom lead to the breakdown of introduced chemicals. Many microorganisms have been shown to degrade aromatic and other hydrocarbon compounds. Two different catabolic processes are responsible for the removal of chemicals from the environment. The first, primary metabolism, refers to the mineralization process in which carbon and energy are derived from the breakdown of the organic molecule by the microorganisms. The second, cometabolism or co-oxidation, refers to the process in which biotransformation of the chemical occurs without the net production of energy or carbon. Organisms use carbon and energy derived from a second substrate for growth and to carry out the cometabolic transformation. The purpose of this study was to test for the presence of primary and cometabolic organisms in the marine environment and to develop techniques for their isolation. Both aromatic compounds and the insecticide dieldrin were used as test compounds. Partial characterization of organisms known to metabolize aromatics was carried out using plasmid screening procedures and thin layer chromatography. One isolate which produced clearing zones on dieldrin was also screen for plasmids. 1 table.

16831 (DOE/ER/13101—1, pp 46-48) **Is the ability of microorganisms to degrade polycyclic aromatic hydrocarbons plasmid mediated?.** Jouper, A. (Gothenberg Univ., NE). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

Microorganisms in soil and waters convert many synthetic organic chemicals to inorganic products. Other compounds are transformed by cometabolism. Very little is known about these processes, although the fate of these compounds in the environment is of concern. Catabolism of polycyclic aromatic hydrocarbons (PAH) has been shown to be plasmid mediated in some cases. The researchers examined a PAH-degrader in the Great Sippewissett salt marsh, and if the degradating ability was encoded by a plasmid. The authors also wanted to know if the microorganisms made the PAH water solubie by hydroxylation or be conjugation.

16832 (DOE/ER/13101—1, pp 49-56) **Sheath pigment formation in a blue-green algae lyngbya aestuarii as an adaptation to high light.** Muehlstein, L.K. (Wright State Univ., Fairborn, OH). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

The Great Sippewissett salt marsh has extensive areas of intertidal microbial mats. The top layer of the mats is composed primarily of blue-green algae Lyngbya aestuarii and Microcoleus chthonoplastes. These mats are subjected to long exposures of high light intensity which can potentially cause photodynamic damage to the microorganisms. L aestuarii with heavily pigmented sheaths is often found in these exposed areas. The conditions for sheath pigment formation are not yet understood. Iron concentrations in the environment, periodic desiccation and light intensity are possible factors which may influence sheath pigment formation. From the results of the present study, however, exposure to high light appears to be the primary requirement for sheath pigment formation. The yellow-brown sheath pigment has yet to be fully characterized. The staining of the Lyngbya sheaths is due to the pigment scytonemine and is very effective in reducing incident light. There has been speculation that the sheath pigment evolved in the Precambrian, as a primitive form of protection from high light intensity, including ultraviolet radiation. No recent or detailed chemical analysis of this pigment has been reported. 2 figures, 2 tables.

16833 (DOE/ER/13101—1, pp 55-57) **Diel vertical movements of bacteria in intertidal streams of Sippewissett Marsh.** Noll, K. (Univ. of Illinois, Urbana). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

Environmental conditions within the sediment of intertidal streams of salt marshes change drastically in 24 hrs. Light intensity and quality; surface temperature; dissolved oxygen and sulfide concentrations in pore-waters; and depth of watercover all play a role in determining the survival of bacteria living in this environment. The purpose of this report is to observe how bacteria in these areas respond to environmental changes in the course of a day and to attempt to determine what causes these responses. To simplify the system, the work described here was confined to monitoring the effects of light intensity and sulfide under laboratory and field conditions.

16834 (DOE/ER/13101—1, pp 60-68) **Chemtaxis in Spirochaeta aurantia: a possible cation effect. Screening for potential chemorepellents.** Robertson, C.Y. (Skidaway Institute of Oceanography, Savannah, GA). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

The aim of this investigation was to develop a more thorough understanding of chemotaxis in Spirochaeta aurantia. S. aurantia is a true bacteria that possesses a morphology and form of locomotion unique to all other orders of bacteria. Many investigators have attempted to understand the full mechanism behind spirochete motility, but much is left to speculation. Chemoreception in S. aurantia as well as other bacteria is of particular interest; a better understanding of chemoreception and its tie with motility would provide information regarding a very primitive form of behavior. The mechanism by which bacteria distinguish chemical differences in their environment has been well characterized. Cations are known to play important roles in osmoregulation and in the maintenance of enzymes and other macromolecules during anabolic and catabolic processes in bacteria. One goal of this study was to provide preliminary findings on the effects that different salts at varying concentrations have on chemotaxis in S. aurantia. A second goal of this study was to develop an assay that would determine if a substance could serve as a chemorepellent to S. aurantia. Ideally, these findings would provide better understanding of the ecology of S. aurantia as well as provide valuable information leading to a thorough understanding of spirochete behavior. 3 figures, 1 table.

16835 (DOE/ER/13101—1, pp 67-68) **Design and construction of a reactor system to model the anaerobic/oxic wastewater treatment system.** Skladany, G.J. (Clemson Univ., SC). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

Secondary wastewater treatment systems are designed to remove suspended solids, soluble organics, and nutrients from wastewater, resulting in an effluent acceptable for disposal into receiving waters. Soluble organics are converted into biomass under aerobic conditions, resulting in a diverse microbial community known as activated sludge. Modifications to the totally aerobic method of treatment have been made in recent years by exposing the activated sludge to an initial anaerobic treatment, followed by an aerobic treatment zone. This modified process has been shown to remove excess phosphate from the wastewater above the amounts needed for microbial growth, and also results in the production of a sludge with improved settling qualities. The basic biological phenomena occurring in this treatment system are poorly

understood, due to both the complex interactions taking place in mixed microbial populations and also the lack of an accurate model of the system for use in the laboratory. Researchers have designed an inexpensive bench-top reactor system that will allow investigation of the microbiology of the anaerobic/oxic treatment system under controlled conditions.

16836 (DOE/ER/13101—1, pp 69-74) **Factors affecting growth inhibition of enteric bacteria by methyl α-D-glucoside.** Sutherland, D. (Creighton Univ., Omaha, NE). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

In previous work it was reported that a marine enteric bacterium, Vibrio parahaemolyticus, responded in a peculiar fashion to analogs of glucose. When methyl α-D-glucoside (αMG) was added to cultures of the organism growing on either mannose or fructose, there was an initial period of inhibition, two to four hrs in low phosphate media (0.6M), which was rapidly overcome and subsequent growth was no longer affected by αMG. This phenomenon has since been termed an escape from inhibition. Also, this work raised the question as to whether this escape differed from that observed in E. coli. The purpose of this experimental work this summer was to determine the escape behavior of E. coli, and to describe the mechanism of escape from the inhibition αMG. In these studies this year, it was decided to work with the more extreme halophilic marine bacterium Vibrio harveyi rather the Vibrio parahaemolyticus.

16837 (DOE/ER/13101—1, pp 78-88) **Investigations into the mechanisms of interaction between to microbial populations in activated sludge.** Wrenn, B.A. (Univ. of Miami, Florida). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

The A/O process for waste water treatment places strong selective pressures on the microbial community of the activated sludge. These pressures result in domination of the sludge by two microbial populations. One of these populations actively accumulates and stores phosphate from the wastewater. The other population has a marked tendency to form large flocs. This second population gives the sludge excellent settling characteristics; the former insures that the effluent water will be low in phosphate. The aim of this study was to supply a quantitative data base which could be applied to the study of the interactions between these two populations. This includes an evaluation of the abilities of isolates to utilize carbohydrates supplied in the culture medium and an assessment of the ability of a phosphate accumulating isolate to grow on metabolites of glucose produced during clumper growth on minimal media. Also, an attempt was made to identify the products of glucose metabolism in a floc-forming isolate. Finally, some preliminary experiments were conducted with the aim of characterizing the nature of the interactions involved in floc-formation.

16838 (DOE/ER/13101—1, pp 94) **Microbial selection in an artificial ecosystem.** Vincent, W.S. (Univ. of Delaware, Newark). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

Commercial waste water treatment plants form an artificial ecosystem in which waste water contributes nutrients in very dilute concentrations. These nutrients are then converted into bacterial biomass which is removed or recycled through the system as sludge. The effluent, essentially nutrient-free, is then discharged into streams, lakes and ground water. As sludge is concentrated by gravitational settling, only those bacterial cells which can form clumps will remain in the system. As 20% to 50% of the sludge is recycled with each complete flow through of the system, there is a powerful selection process for cell which cause clumping, as well as those which can be clumped. Twenty-one different bacterial isolates from many sources were tested for their ability to e clumped by a clumping strain (CH-1) isolated from a sludge sample. Only 3 strains, all Acinetobacter-like, isolated from sludge, were competent to be clumped. Four strains of Acinetrobacter lwoffii isolated from soil were not competent. Thus, the water treatment system acts as a highly selecting ecosystem which favors the retention of oligotrophic, clumping bacteria. As clumping is a procedure by which oligotrophic bacteria increase their ability to take advantage of scarce nutrients, the recycled sludge process conserves those cells which clump. Others will be lost from the system.

16839 (DOE/ER/13101—1, pp 90) **Studies on manganese oxidizing spore forming bacteria.** Halvorson, H.O.; Keynan, A.; Tiernan, T. (Brandeis Univ., Waltham, MA). 17 Jun 1986. NTIS, PC A05/MF A01. File Number DE86013180.

In Microbial ecology summer research program. Marine Biological Laboratory, Woods Hole, Massachusetts, June 20-August 26, 1983.

Manganese oxidizing spore forming bacteria were isolated from the Sippewissett Marsh by plotting heated marsh samples on Zobell sea water medium. Eight strains were selected by their ability to oxidize manganese verified by the Leucoberbelin reaction. Strain Mn 8 was selected for further studies. Spores of this strain were prepared as described previously. When examined by flame photometry the spores of this species were found to have a significantly higher concentration Mn^{+} and Fe^{++} than any of several well known soil or marine spore forming bacteria. Further, sporulating cells concentrate Ca^{++} in a high Mg^{++} environment. Spores of Mn 8 had a higher specific density than other marine spore formers investigated; they centrifuged through 62.5 - 65% renographin, while most other spores will pellet through 50-55% renographin. No significant germination occurred in Zobell or other nutrient media, with or without sea water. Over 80% germination occurred when spores were incubated at 30°C for 80 min in medium containing 12.2 mM glucose, 17mM NaCl, 18.7 mM NH_4 Cl, 0.4 mM L-alanine, 0.4 mM adenosine, 1% Tween-80 and 0.01 M Hepes buffer pH 8.2; choramphenical was included to prevent outgrowth. Germination did not require heat activation. During germination loss of refractility is accompanied by swelling with a substantial increase in volume. Although the germination requirements of strain Mn 8 seem to be more complex, they are similar to those of a previously described marine spore former in their requirements for NH_4^{+}, Na^{+}, and relative high pH.

16840 **Increase in cell mass during the division cycle of Escherichia coli B/rA.** Kubitschek, H.E. (Argonne National Lab., IL). *Journal of Bacteriology;* **168**: No. 2, 613-618(Nov 1986). Contract W-31-109-ENG-38.

Increase in the mean cell mass of undivided cells was determined during the division cycle of Escherichia coli B/rA. Cell buoyant densities during the division cycle were determined after cells from an exponentially growing culture were separated by size. The buoyant densities of these cells were essentially independent of cell age, with a mean value of 1.094 g ml^{-1}. Mean cell volume and buoyant density were also determined during synchronous growth in two different media, which provided doubling times of 40 and 25 min. Cell volume and mass increased linearly at both growth rates, as buoyant density did not vary significantly. The results are consistent with only one of the three major models of cell growth, linear growth, which specifies that the rate of increase in cell mass is constant throughout the division cycle.
